44. In a machine for shaping metal receptacles, the combination with suitable supports mounted to permit an opening and closing movement, of a plurality of mold-sections carried by the supports each of the sections comprising a plurality of parts having abutting ends, a plurality of screws the heads of each screw being connected to two adjacent parts of a mold-section at their line of contact, means cooperating with the screws for causing them to move outward and give the parts of the mold-sections an outward movement, and means for producing an interior fluid-pressure, substantially as described.

45. In a machine for shaping metal receptacles, the combination with suitable supports mounted to permit an opening and closing movement, of a plurality of mold-sections carried by the supports each of the sections comprising a plurality of parts having abutting ends, a plurality of screws the heads of each screw being connected to two adjacent parts of a mold-section at their line of contact, suitable nuts cooperating with the screws, a series of rotating gears for operating the nuts whereby the screws are caused to move outward and impart a movement to the parts of the mold-sections, and means for producing an interior fluid-pressure, substantially as described.

46. The combination with a plurality of bilged supports, mounted to permit a relative opening and closing movement, of means for locking the supports in their closed position, an abutment, means for moving the abutment into and out of position, a plurality of mold-sections each comprising a plurality of parts the adjacent ends of which abut, screws connected to said adjacent ends, means including rotating gears and suitable connections for moving the abutting ends of the parts to give the mold a bilged form, a head, means for moving the head inward as the parts of the mold are moved outward, and means for producing an interior fluid-pressure, substantially as described.

47. In a machine for shaping metal receptacles, the combination with a mold, of a suitable abutment at one end thereof, means for moving the mold outward between its ends, a head for closing the other end of the mold, means for producing an interior fluid-pressure, and means for causing the head to move inward simultaneously with said pressure, substantially as described.

48. In a machine for shaping metal receptacles, the combination with a mold comprising a plurality of sections each section being composed of a plurality of abutting parts, of an abutment at one end of the mold, means for moving the parts of the sections outward at their line of contact, a head for the other end of the mold, means for producing an interior fluid-pressure, and means for causing the head to move inward simultaneously with said pressure, substantially as described.

49. In a machine for shaping metal receptacles, the combination with

a mold, of a suitable abutment at one end thereof, means for moving the mold outward between its ends during the shaping operation and restoring it to its original form after the completion of the shaping operation, a head for closing the other end of the mold, and means for simultaneously subjecting the interior of the receptacle and said head to fluid-pressure, substantially as described.

50. In a machine for shaping metal receptacles, the combination with a mold comprising a plurality of sections each section being composed of a plurality of abutting parts, of an abutment at one end of the mold, means for moving the parts of the sections outward at their line of contact, a head for the other end of the mold, and means for simultaneously subjecting the interior of a receptacle and said head to fluid-pressure, substantially as described.

51. The combination with a mold for shaping hollow metal articles, of an abutment at one end of the mold, a head at the other end of the mold said head having a bearing-surface against which the end of the article to be shaped rests, a hydraulic chamber above the head, said chamber being of greater area than the area of the bearing-surface, a pressure-supply pipe, a branch from said pipe leading to the hydraulic chamber above the head and a branch from said pipe leading to the interior of the article to be shaped, substantially as described.

52. The combination with a bilged mold for shaping hollow metal articles, of an abutment at one end of the mold, a head at the other end of the mold said head having a bearing-surface against which the end of the article to be shaped rests, a hydraulic chamber above the head, said chamber being of greater area than the area of the bearing-surface, a pressure-supply pipe, a branch from said pipe leading to the hydraulic chamber above the head and a branch from said pipe leading to the interior of the article to be shaped, substantially as described.

53. The combination with a mold comprising a series of sections adapted to receive an outward movement, of an abutment at one end of the mold, a head at the other end of the mold said head having a bearing-surface against which the end of the article to be shaped rests, a hydraulic chamber above the head, said chamber being of greater area than the area of the bearing-surface, a pressure-supply pipe, a branch from said pipe leading to the hydraulic chamber above the head and a branch from said pipe leading to the interior of the article to be shaped, substantially as described.

54. The combination with a mold for shaping hollow metal articles said mold comprising a plurality of sections each section being composed of abutting parts, of means for moving the parts outward at their line of contact, an abutment at one end of the mold, a movable block at the other end of the mold said block having a bearing-surface against which the head of the article to be shaped rests and a shoulder adapted to come in contact with the ends of the mold-sections whereby the position of the sections limits the inward movement of the block, and means for subjecting the interior of the receptacle and the block to different degrees of fluid-pressure, substantially as described.

55. The combination with a pair of conical bilged supports mounted to permit an opening and closing movement, of an abutment, means for moving the abutment into and out of position at one end of the supports, a plurality of mold-sections carried by the supports each of said sections comprising a plurality of abutting parts, screws connected to said parts at their line of contact, suitable connections including a series of rotating gears for operating the screws to move the sections, a movable block at the other end of the mold, said block having a bearing-surface which rests against the article to be shaped and a shoulder adapted to rest against the ends of the parts of the mold-sections, means for subjecting the interior of the article to be shaped to fluid-pressure, and means for causing the block to move inward until its shoulder strikes the end of the mold-sections, substantially as described.

56. The combination with a pair of conical bilged supports mounted to permit an opening and closing movement, of an abutment, means for moving the abutment into and out of position at one end of the supports, a plurality of mold-sections carried by the supports each of said sections comprising a plurality of abutting parts, screws connected to said parts at their line of contact, suitable connections including a series of rotating gears for operating the screws to move the sections, a movable block at the other end of the mold, said block having a bearing-surface which rests against the article to be shaped and a shoulder adapted to rest against the ends of the parts of the mold-sections, means for subjecting the interior of the article to be shaped and the block to different degrees of fluid-pressure whereby the article is caused to assume the shape of the mold and the block to move inward until its shoulder comes in contact with the mold-sections, substantially as described.

57. The combination with a pair of conical bilged supports mounted to permit an opening and closing movement, of an abutment, means for moving the abutment into and out of position at one end of the supports, a plurality of mold-sections carried by the supports each of said sections comprising a plurality of abutting parts, screws connected to

JUNE 3, 1903.

mid parts at their line of contact, suitable connections including a series of rotating gears for operating the screws to move the sections, a movable block at the other end of the mold, said block having a bearing-surface which rests against the article to be shaped and a shoulder adapted to rest against the ends of the parts of the mold-sections, means for simultaneously subjecting the interior of the article to be shaped and the block to different degrees of fluid-pressure whereby the article is caused to assume the shape of the mold and the block to move inward until its shoulder comes in contact with the mold-section, substantially as described.

701,550. METHOD OF SHAPING METAL RECEPTACLES. MARK L. DUNN, New York, N. Y., assignor to Standard Oil Company, Bayonne, N. J., a Corporation of New Jersey. Filed Jan. 11, 1902. Serial No. 89,316. (No model.)

(Claim.—1. The method of shaping hollow metal articles which consists in subjecting the articles to an interior expanding fluid-pressure and supporting the walls or parts to be expanded exteriorly at successive separated positions during the shaping operation, substantially as described.

2. The method of shaping hollow metal articles which consists in subjecting the articles to an interior expanding fluid-pressure and simultaneously shortening the article by an exterior pressure the lines of force of the exterior pressure being at an angle to the movement of the metal produced by the interior expansive force, and supporting the walls of the articles or the parts thereof to be expanded exteriorly at their several positions during the shaping operation, substantially as described.

3. The method of shaping hard-metal receptacles having heads or ends and side walls which consists in subjecting a receptacle with its heads or ends in position to an interior expanding fluid-pressure, supporting the walls during the expanding operation and simultaneously with the expanding operation preventing an outward movement of the heads or ends, substantially as described.

4. The method of shaping hard-metal receptacles having heads or ends and side walls which consists in subjecting a receptacle with its heads or ends in position to an interior expanding fluid-pressure, supporting said walls at successive separated positions during the expanding operation and simultaneously therewith preventing an outward movement of the heads or ends, substantially as described.

5. The method of shaping hard-metal receptacles having heads or ends and side walls which consists in subjecting a receptacle with its heads or ends in position to an interior expanding fluid-pressure, supporting said walls during the expanding operation and simultaneously with the expanding operation subjecting the heads or ends to an exterior pressure which is greater than the interior pressure whereby the receptacle is shortened in a line which is at an angle to the direction of the expanding force, substantially as described.

6. The method of shaping hard-metal receptacles having heads or ends and side walls which consists in subjecting a receptacle with its heads or ends in position to an interior expanding fluid-pressure, supporting said walls at successive separated positions during the expanding operation and simultaneously with the expanding operation subjecting the heads or ends to an exterior pressure which is greater than the interior pressure whereby the receptacle is shortened in a line which is at an angle to the direction of the expanding force, substantially as described.

701,551. GRAIN-CAR DOOR. HANS L. EDWARDS, Aurora, Ill., assignor of two-thirds to Benjamin A. Sanders, Louis H. Coia, and Aurelio Coia, Aurora, Ill. Filed Jan. 22, 1902. Serial No. 91,787. (No model.)

(Claim.—1. The combination of a car provided at opposite sides of its doorway with ways, and a sectional grain-door provided at the bottom with a flange interlocked with the bottom of the car, whereby the grain-door is held against upward movement and the grain is prevented from clogging, substantially as described.

2. The combination of a car provided at the bottom of its doorway with a groove, and a sectional grain-door provided at the bottom with outwardly-projecting flanges fitting in the groove of the car, whereby the grain-door is interlocked with the bottom thereof to hold the door against vertical movement and to provide a grain-tight joint, substantially as described.

3. The combination of a car provided at opposite sides with ways, a grain-door arranged in the ways and composed of sections hinged together and provided at the bottom with flanges interlocked with the bottom of the car, and the vertical chute or bars secured to the inner faces of the sections and covering the inner edges of the said sections at the joint, substantially as described.

4. The combination of a car, a grain-door composed of sections hinged together and interlocked at their bottom and outer edges with the car and provided with openings, slides normally covering the openings, and means for raising the door, substantially as described.

5. The combination of a car, a grain-door composed of hinged sections, one of the sections being provided with a keeper and a combined brace and latch-bar adjustably connected with the other section and provided with means for engaging the keeper, substantially as described.

6. The combination of a car, a grain-door composed of hinged sections, a stud mounted on one of the sections, a keeper arranged on the other section, and a combined brace and latch-bar provided with a slot receiving the stud, said latch-bar being also provided with a hook for engaging the keeper, substantially as described.

7. The combination of a car, a vertical rod secured to the car, a clamp mounted on the rod and adapted to swing horizontally and slide vertically, a grain-door composed of sections, and a link hinged to the clamp and to the grain-door, substantially as described.

8. The combination of a car, a vertical rod secured to the car, a clamp composed of two sections and having an opening receiving the rod, said clamp being also provided with ears, a grain-door, a plate secured to the grain-door and provided with ears, and a link hinged between the said car, substantially as described.

701,552. MUGULAR-ALARM. SAMUEL R. BRIDGES and FREDERICK FETTERSON, Chicago, Ill. Filed Mar. 31, 1902. Serial No. 100,764. (No model.)

(Claim.—1. In a device of the character specified, the combination with a spring-actuated gang adapted for application to a door, of a brake normally holding the same inoperative, a push rod and button operable from the outside of the door to release said brake, and jointed connections intermediate said gang and the door-knob on the inside of the door adapted to also release said brake and permit the gang to come open turning the door-knob in either direction, substantially as described.

2. In a device of the character specified, the combination with a

JUNE 3, 1903.

U. S. PATENT OFFICE.

2211

spring-actuated gang adapted for application to a door, of a spring-actuated brake normally holding the gang-hammer inoperative, a push rod and button operable from the outside of the door to release said brake from the gang-hammer, and jointed connections intermediate said gang and the door-knob on the inside of the door, one element of which has a cam-surface adapted to engage and retract said brake upon turning the door-knob, substantially as described.

3. In a device of the character specified, the combination with a spring-actuated gang adapted for application to a door, of a spring-pressed pin adjustably mounted in the supporting-frame of the gang mechanism, said pin having thereon a brake adapted to engage and render inoperative the gang-hammer and a radially-projecting arm, a push rod and button operable from the outside of the door and engaging the adjacent end of said adjustable pin, and jointed connections intermediate said gang and the door-knob on the inside of the door, one element of which has a double cam-surface adapted to underlie and retract said arm, said flange being confined by the inwardly-bent end of the latter, substantially as described.

4. In a device of the character specified, the combination with a spring-actuated gang adapted for application to a door, of a spring-pressed pin adjustably mounted in the supporting-frame of the gang mechanism, said pin having fast thereon a brake-adaptor adapted to engage and block the gang-hammer and a radially-projecting arm provided with an inwardly-bent end, a push rod and button operable from the outside of the door and engaging the adjacent end of said adjustable pin, and pivotally-mounted jointed connections intermediate said gang and the door-knob on the inside of the door, one element of which has an upstanding flange provided with a double cam-surface adapted to underlie and retract said arm, said flange being confined by the inwardly-bent end of the latter, substantially as described.

5. In a device of the character specified, the combination with a spring-actuated gang adapted for application to a door, of a spring-pressed pin adjustably mounted in the supporting-frame of the gang mechanism, said pin having fast thereon a brake adapted to engage and render inoperative the gang-hammer and a radially-projecting arm, a lever pivoted to the door intermediate the door-knob and the gang and having a segment-shaped end adjacent the latter, an upstanding curved marginal flange on the segment end of said lever adapted to underlie said radially-projecting arm and provided with a pair of oppositely-directed cam-surfaces adapted to retract the latter, and an actuating-arm removably clamped to the shank of the door-knob and pivotally connected to the adjacent end of said lever, substantially as described.

6. In a device of the character specified, the combination with a spring-actuated gang adapted for application to a door, of a spring-pressed pin adjustably mounted in the supporting-frame of the gang mechanism, said pin having fast thereon a brake adapted to engage and render inoperative the gang-hammer and a radially-projecting arm, a push rod and button operable from the outside of the door and engaging the adjacent end of said adjustable pin, a lever pivoted to the door intermediate the door-knob and the gang and having a segment-shaped end adjacent the latter, an upstanding curved marginal flange on the segment end of said lever adapted to underlie said radially-projecting arm and provided with a pair of oppositely-directed cam-surfaces adapted to retract the latter, and an actuating-arm removably clamped to the shank of the door-knob and pivotally connected to the adjacent end of said lever, substantially as described.

701,553. AIR-MOUNTING APPARATUS. GILBERT H. EVANS, Brooklyn, N. Y. Filed Apr. 12, 1901. Serial No. 84,300. (No model.)

(Claim.—1. The combination of a tubular casing having a substantially horizontal toothed lower edge, means for causing water to run down

the wall of such casing, and a fan arranged to pass a current of air across such lower edge.

2. The combination of a fan, and a water-wheel arranged to drive said fan, said wheel having spokes inclined in a direction to assist said fan.

3. The combination in an air-mountain apparatus adapted to be driven by water-power and having a discharge-pipe, of a fitting having openings for an inlet-pipe, a driving-pipe and a flushing-pipe, and a detachable flushing-pipe adapted to be attached at opposite ends to said fitting and said discharge-pipe to clean the latter.

701,554. DOOR-HINGE. WILLIAM L. EVANS, Jr., Washington, Ind. Filed Oct. 31, 1901. Serial No. 80,977. (No model.)

(Claim.—1. A hinge comprising a leaf or plate designed to be secured to a door-frame, a rotary bar relatively mounted at its forward end on the leaf or plate and provided at its rear portion with screw-threads, the rear portion of the bar forming a guide, means for supporting and holding the rotary bar against longitudinal movement, a nut arranged on the front threaded portion of the rotary bar, a coiled spring disposed on the bar and having its front end engaged by the nut, a leaf or plate designed to be secured to a door, and means slidable on the rear portion of the rotary bar for connecting the leaf or plate of the door with the rear end of the spring, substantially as described.

2. A hinge comprising a leaf or plate designed to be secured to a door-frame, a spring, a sliding member connected with the leaf or plate and engaged by the spring, and a leaf or plate designed to be secured to a door and connected with the sliding member and provided with rollers arranged to engage the leaf or plate of the door-frame and located at opposite sides of the joints of the hinge, substantially as described.

3. A hinge comprising a leaf or plate 1, an approximately U-shaped supporting-frame fixed to the leaf or plate 1, the rotary bar journaled on the frame and on the leaf or plate 1 and held against longitudinal movement and provided with a threaded front portion and with a smooth rear portion forming a guide, a slidable member guided on the smooth rear portion of the rotary bar, a leaf or plate connected with the slidable member and designed to be secured to a door, a spring engaging the slidable member, and a nut arranged on the front threaded portion of the rotary bar and engaging the spring, substantially as described.

4. A hinge comprising a leaf or plate designed to be mounted on a door-frame, a supporting frame or barrel open at its front and closed at its rear end and extending rearward from the leaf or plate, a bar relatively mounted at its forward end in the leaf or plate at the mouth of the frame or barrel and at its rear end in the closed end of the said frame or barrel and held against longitudinal movement by the latter and having its forward end exposed at the leaf or plate for rotation, said bar being also provided with a threaded portion and a smooth guiding portion, a spring disposed on the bar, a nut arranged on the threaded portion of the bar and engaging the spring, a leaf or plate designed to be secured to a door, and means for connecting the leaf or plate of the door with the spring, substantially as described.

5. A hinge comprising leaves or plates 1 and 5 designed to be mounted respectively on a door-frame and on a door, a supporting frame or barrel open at its front and closed at its rear end and extending rearward from the leaf or plate 1, a bar relatively mounted at its forward end on the leaf or plate 1, at the open end or mouth of the frame or barrel and journaled at its rear end in the closed end of the said frame or barrel, said bar being held against longitudinal movement by the latter and provided with a threaded front portion and having a smooth lower or rear portion forming a guide, a nut arranged on the threaded portion of the bar and held against rotation, a slidable member connected with the leaf or plate 5 and guided on the smooth rear portion of the bar, and a spring interposed between the nut and the slidable member, substantially as described.

6. A hinge comprising a leaf or plate 1 provided with apertures, a rotary guide-bar having screw-threads and held against longitudinal move-

ment, a yoke arranged to slide on the guide-bar and extending through the aperture of the plate 1, a nut arranged on the threaded portion of the guide-bar between the sides of the yoke and held against rotation by the same, and a spring interposed between the nut and the yoke, substantially as described.

7. A hinge comprising a leaf or plate 1 provided with apertures, an approximately U-shaped yoke having parallel sides and extending through the apertures, a guide-bar connected with the leaf or plate 1 and held against longitudinal movement and extending through the inner end of the yoke and receiving the latter, a spring engaging the yoke, and a leaf or plate pivotally connected with the yoke and designed to be mounted on a door, substantially as described.

8. A hinge comprising a leaf or plate 1 having apertures, an approximately U-shaped frame fixed to the leaf or plate, a guide-bar mounted on the frame and on the plate and held against longitudinal movement, an approximately U-shaped yoke having parallel sides and arranged to slide on the guide-bar and extending through the apertures of the leaf or plate 1, a leaf or plate connected with the yoke and designed to be mounted on a door, and a spring arranged on the guide-bar and engaging the yoke, substantially as described.

701,555. RAIN OR FRUIT ELEVATOR. WILLIAM M. SWINE, Fresno, Cal. Filed Aug. 26, 1900. Renewed Mar. 17, 1902. Serial No. 21,841. (No model.)

Claim.—1. The combination with an endless upright conveyor comprising sprocket-chains and a series of equally-spaced gravity-buckets pivoted therebetween, and a hopper, having an opening in its bottom, of a rotary cylindrical filling-drum located adjacent to the hopper-opening, sprocket-wheels at the ends of the drum operated by said sprocket-chains, said drum being provided with a series of equally-spaced pockets, so arranged as to individually receive their charges of material from the hopper and empty the same into the respective gravity-buckets, substantially as set forth.

2. In an apparatus of the class described, the combination with the endless conveyor having equally-spaced pivoted gravity-buckets, of a hopper, a rotary filling-drum provided with a series of equally-spaced pockets so arranged as to individually receive their charges of material from the hopper and empty the same into the respective gravity-buckets, and a series of guiding-rollers for the endless conveyor, one of the guiding-rollers constituting a dumping device for effecting a tilting of the buckets.

701,556. PROCESS OF MAKING WATER-GAS. ERIL FLEMMING, Dresden-Stralun, Germany, assignor to Jacob Eduard Goldschmidt, Frankfurt-on-the-Main, Germany. Filed Aug. 2, 1901. Serial No. 20,646. (No specimen.)

Claim.—1. In the process of making water-gas from bituminous fuel by blowing up the fuel to high temperature and passing steam through it, the improvement which consists in passing through the generator after the charging of a fresh quantity of fuel a quantity of air less than that used for blowing up the fuel and at rate slower than that used for blowing up and slow enough to generate producer-gas.

2. In the process of making water-gas from bituminous fuel by blowing up the fuel to high temperature and passing steam through it, the improvement which consists in passing through the generator after the charging of a fresh quantity of fuel and before the passing of steam, a quantity of air less than that used for blowing up the fuel and at rate slower than that used for blowing up and adapted to generate producer-gas.

3. The process of making water-gas from bituminous fuel in twin generators, which consists in blowing up one generator and charging fresh fuel into it, blowing through the other generator a quantity of air less than necessary to blow it up and at a rate slower than that used for blowing up, passing the escaping gases through the said first generator, admitting steam into the second generator and passing the escaping gases through the first generator, blowing up the second generator, blowing air slowly and in small quantity through the first generator, as described, and passing steam through the first generator and afterward through the second one, substantially as described.

4. A process for the production of water-gas from mineral coal or the like consisting in the blowing up of the fuel in any ordinary way causing thereby a high temperature throughout the fuel, charging coal into the generator, generating producer-gas by blowing in slowly a quantity of air less than that used for blowing up the fuel and passing steam through the fuel.

701,557. CANDLE. THOMAS J. GARDNER, Boston, Mass. Filed Apr. 12, 1902. Serial No. 100,000. (No model.)

Claim.—1. A candle having a wick extended throughout the length thereof, the said wick at a portion between its ends being treated with a compound of asbestos and cement which will harden when heated to thereby extinguish the flame.

2. A candle having a wick extended throughout the length thereof, a portion of said wick near the base of the candle being treated with a compound which will harden when heated to thereby extinguish the flame.

701,558. TIRE FOR VEHICLE-WHEELS. CHARLES J. SHADEN, Chicago, Ill. Filed Feb. 12, 1902. Serial No. 94,771. (No model.)

Claim.—A tire comprising a single tread-tube having spaced integral partitions across the top thereof and a continuous slot extending centrally around the tire through the partitions and the rim-face of the tube, whereby the tube and the partitions may be spread open laterally, and disconnected separably-resiliently unperforated cork segments filling the space between the partitions.

701,559. SINKING FOUNDATIONS. ADOLF GUNTER, Berlin, Germany. Filed Apr. 12, 1901. Serial No. 93,851. (No model.)

Claim.—1. Means for sinking shafts for foundations comprising a casing and a structure surrounding said casing, attached thereto, and forming one or more chambers or spaces reaching down to the bottom edge of the casing, so as to facilitate the location and removal from above of obstacles such as boulders, tree-trunks, &c., which may obstruct the sinking of said casing, substantially as set forth.

2. Means for sinking shafts for foundations comprising a casing, a column, and means for keeping a space between said casing and column, reaching down to the bottom edge of the casing, so as to facilitate the location and removal from above of obstacles such as boulders, tree-trunks, &c., which may obstruct the sinking of said casing, substantially as set forth.

3. Means for sinking shafts for foundations comprising a casing, a column, and distance-pieces for keeping a space between said casing

and said column 2, reaching down to the bottom edge of the casing, so as to facilitate the location and removal from above of obstacles such as boulders, tree-trunks, &c., which may obstruct the sinking of said casing, substantially as set forth.

701,580. INSECT-DESTRUCTOR. SALATHIEL V. GRAVE, McFall, Mo. Filed Mar. 12, 1902. Serial No. 95,797. (No model.)

Claim.—1. An insect-destructor, comprising a bench, a receptacle mounted thereon, an air-chamber underneath said receptacle and communicating therewith, a slide over an aperture in the bottom of said receptacle, a bellows having its outer wall stationary, a hinged partition between said walls, and means for swinging said partition whereby a continuous blast may be maintained in said air-chamber, as set forth.

2. An insect-destructor comprising a bench, a receptacle mounted thereon, an air-chamber, a reciprocating slide positioned over a partition in said receptacle, an air-chamber underneath said receptacle, a bellows having stationary walls, a hinged partition intermediate said walls, a bellows-slit fastened to said walls and partition, a rock-shaft journaled on the top wall of said bellows, pivotal link connection between said hinged partition and shaft, a handle for rocking said shaft, and a rod connecting said handle with said slide, whereby as the bellows is worked a continuous blast of air is blown into the air-chamber, simultaneously with the feeding of the poison from the receptacle, as set forth.

701,581. BOOKLE. EDWARD J. GUNTER, Halyria, Mass. Filed Aug. 22, 1901. Serial No. 21,798. (No model.)

Claim.—1. In a bookle, a frame, a tongue, one end of which loosely embraces one of the bars of said frame, a cylindrical tongue-actuator concentrically hung on said tongue-actuated bar, and means for rotating said actuator, and thereby imparting an endwise movement to said tongue in a direction across said frame, substantially as described.

2. In a bookle, a frame having front and rear bars, a tongue one end of which embraces one of said bars, a rotatable cam on said tongue-actuated bar engaging said tongue, means for reciprocally rotating said cam and for the engagement thereof with a strap attached to said bookle, and whereby said cam and tongue are held against displacement consequent upon a strain on said strap, substantially as set forth.

701,582. CAR-SEAT. HENRY & HALL, Philadelphia, Pa., assignors to the Hale and Kilbourn Manufacturing Company, a Corporation of Pennsylvania. Filed Oct. 20, 1901. Serial No. 99,699. (No model.)

Claim.—1. In a seat-cushion the combination of a wooden frame, a series of spring-plate structures extending across the top of said frame and each comprising a series of parallel strips connected together by cross-strips, coil-springs secured to the cross-strips and supported within the wooden frame, and suitable upholstery arranged above the spring-plate structures and secured to the wooden frame.

2. In a seat-cushion, the combination of a wooden frame, a series of spring-plate structures extending across the top of and having their ends secured to said frame and each comprising a series of parallel strips connected together by cross-strips, coil-springs secured to the cross-strips and supported within the wooden frame, wide textile webbing resting upon the said series of parallel strips of metal and wider than the width of the said spring-plate structures, and suitable upholstery arranged above the spring-plate structures and webbing and secured to the wooden frame.

3. In a seat-cushion, the combination of a wooden frame, a series of spring-plate structures extending across the top of said frame and each comprising a central wide strip and a narrow strip upon each side thereof connected together by cross-strips and having their ends bent downward and fastened to the side bars of the wooden frame, coil-springs secured to the central wide strips and supported within the wooden frame, and suitable upholstery arranged above the spring-plate structures and secured to the wooden frame.

4. In a seat-cushion, the combination of a wooden frame, a series of spring-plate structures extending across the top of and having their ends secured in said frame and each comprising a central wide strip and a narrow strip upon each side thereof connected together by cross-strips and said wide and narrow strips having transverse corrugations at intervals in their length, coil-springs secured to the central wide strips and supported within the wooden frame, and suitable upholstery arranged above the spring-plate structures and secured to the wooden frame.

5. A spring-plate structure for a seat-cushion consisting of three parallel plates connected at intervals in their length by transverse or cross-plates riveted thereto, and coil-springs secured to the under side of the middle strip.

6. A spring-plate structure for a seat-cushion consisting of three parallel plates connected at intervals in their length by transverse or cross-plates riveted thereto, a strip of textile webbing of a width greater than the whole width of the strips and secured in position upon the central strip and having its lateral edges extending over the side strips, and coil-springs secured to the under side of the middle strip.

7. A spring-plate structure for a seat-cushion consisting of a wide central corrugated spring-plate, two narrow side plates, transverse or cross-plates riveted to the middle plate of said parallel plates and arranged at intervals in their length, and coil-springs secured to the under side of the corrugated middle plate.

8. In a spring-plate structure for seat-cushions, the combination of a wide central plate U and two narrow side plates C, C', with cross-strips D riveted to said plates C, C', C' and coil-springs E secured to the central plate U in line with the cross-strips D.

9. In a spring-plate structure for seat-cushions, the combination of a wide central plate U and two narrow side plates C, C', having their ends curved downward, with cross-strips D riveted to said plates C, C', C', textile webbing resting upon the plates C, C', C', and of a width greater than the total width of the plate structures and secured thereto and of less length than the length of said plate structures, and coil-springs E secured to the central plate U in line with the cross-strips D.

10. In a spring-plate structure for seat-cushions, the combination of a central plate U and two side plates C, C', with cross-strips I riveted to said plates C, C', U' and coil-springs E secured to the central plate U in line with the cross-strips I.

11. A spring-plate structure adapted for use in seat-cushions made of greatly less width than the length of the completed seat and consisting of parallel spring-plates or strips of metal connected at intervals in their length by transverse or cross strips or plates secured thereto, and a single row of coil-springs secured to the under side of the spring-plate structure and located under said cross strips or plates.

12. A spring-plate structure adapted for use in seat-cushions made of greatly less width than the length of the completed seat and consisting of parallel spring-plates or strips of metal connected at intervals in their length by transverse or cross strips or plates secured thereto, a single row of coil-springs secured to the under side of the spring-plate structure and located under said cross strips or plates, and a strip of textile webbing of a width greater than the whole width of the plate structure and secured in position upon it.

701,568. ADJUSTABLE TYPE-WRITER KEY. JAMES B. HARRISON, Camden, Me. Filed Dec. 17, 1901. Serial No. 96,294. (No model.)

Claim.—1. A type-writer key having a plurality of faces and means for supporting said key adjustably whereby the different faces may be brought into use, substantially as described.

2. An adjustable type-writer key adapted to be turned, having a plurality of faces to be used at different times, substantially as described.

3. A type-writer key having a plurality of faces, and means for automatically locking said key when it is turned to bring a different face into use, substantially as described.

4. A type-writer key having a plurality of faces, and resilient means for automatically locking said key when it is turned to bring a different face into use, substantially as described.

5. A type-writer key having a plurality of faces, and means for automatically locking said key when it is turned to bring a different face into use, said means consisting of a spring arranged to act in connection with the key-body, substantially as described.

6. In combination with the key-body, means for supporting the same to allow it to turn, said key having a plurality of faces and means bearing upon one of the faces to hold the key in an adjusted position, substantially as described.

7. In combination with a key-body, means for supporting the same so that it may be turned and a leaf-spring to bear on the key-body to hold it in an adjusted position, substantially as described.

8. In combination, a key-body, means for supporting the same so that it may be turned, said body having concavities in its faces and a spring to engage the same to hold the key-body in adjusted position, substantially as described.

9. In combination with a key-body having concave faces, means for supporting the key-body to allow the same to turn, and a leaf-spring arranged beneath the key-body to engage the lowermost face thereof, substantially as described.

10. In combination, a key-body having a plurality of faces, arms in which said key-body is journaled and a spring engaging one of the faces of the key-body to allow the same slight yielding movement in its bearings under the stroke of the finger, substantially as described.

11. In combination, the key-body having the concave faces, means for supporting the key-body so that it may be turned and a spring having a convex portion conforming substantially to the concave faces of the key-body, substantially as described.

12. In combination with the key-body, means for supporting the same so that it may be turned, comprising the bracket and a leaf-spring in the form of a closed loop bearing on the key-body, substantially as described.

13. In combination, a key-body, a slotted post connected therewith, a key-lever arranged within the slot and a nut screwed onto the post for holding the parts together, substantially as described.

14. In combination, a key-body, a bracket supporting the same, a post having a head engaging the bracket, said post being slotted and screw-threaded, a key-lever fitting within the slot and a collar or sleeve between the key-lever and bracket with a nut on the post for holding the parts together, substantially as described.

15. In combination, a key-body, a bracket supporting the same, a post extending through the bracket and having a head to engage the same, a key-lever connected with the post, and a spring for holding the key-body in place, said spring being clamped in place between the parts, substantially as described.

16. In combination, a key-body, a bracket supporting the same so that it may be turned, a leaf-spring engaging the key-body, a post passing through the bracket and the ends of the spring, said post having a head to engage the bracket, a key-lever and means for holding the parts together, substantially as described.

17. In combination, the bracket, a key-body arranged to turn therein, a post passing through the bracket, a leaf-spring engaging the key-body and having its ends perforated and engaging the post, said post being slotted, a key-lever in said slot, a nut for holding the key-lever in place and a ferrule between the key-lever and the ends of the spring, substantially as described.

18. In combination, the adjustable key having a plurality of character-bearing faces, a key-lever and a friction-tight connection between said key-lever and key by which the exposed face may be adjusted to the desired position, substantially as described.

19. In combination with the key-lever, a key, and a swivel friction-tight connection between said key and key-lever with means for adjusting the frictional contact, substantially as described.

20. In combination, the key, the post about which the said key may swivel and means for holding the post adjustable to the key, said means serving to produce and adjust the frictional pressure at the swivel to hold the key in place, substantially as described.

21. In combination, the key-lever, a post having a slot to receive the same, means for holding said parts together, the arms on which the key is supported arranged to swivel about the post and the sleeve between the key-lever and the said arm forming a friction-tight joint, substantially as described.

22. In combination, the slotted post, the key-lever fitted to the slot, a nut threaded on the lower end of the post to press the lever upward, supporting means carried by the post for the key and a ferrule between the key-lever and said supporting means, substantially as described.

23. A type-writer key having a plurality of character-bearing faces and adapted to be adjusted to bring different faces to the position of use, a support for the said key and a friction-tight connection between the key and its support, substantially as described.

701,564. LATHES-FRAME. EDWARD W. W. HARRISON and FRANKLIN W. GORDON, Hartford, Conn., assignors to Pratt & Whitney Company, Hartford, Conn. Filed Mar. 12, 1902. Serial No. 96,908. (No model.)

Claim.—1. The combination, substantially as set forth, of a shaft provided with a series of gears of diverse diameters, a pinion disposed parallel with said shaft and having a length equal to that of said series of gears, a guideway disposed parallel to said pinion and arranged to rock upon the axis of the pinion, a carriage mounted to slide in the guideway, a gear mounted in the carriage and engaging said long pinion and adapted to engage any of said series of gears, and means for securing the rocking guideway and the carriage in position.

2. The combination, substantially as set forth, of a shaft provided with a series of gears of diverse diameters, a pinion disposed parallel with said shaft and having a length equal to that of said series of gears, a guideway disposed parallel to said pinion and arranged to rock upon the axis of the pinion, a carriage mounted to slide in the guideway, a gear mounted in the carriage and engaging said long pinion and adapted to engage any of said series of gears, a spring connecting the carriage and guideway and serving to shift the carriage along the guideway, and means for securing the rocking guideway and the carriage in position.

3. The combination, substantially as set forth, of a shaft provided with a series of gears of diverse diameters, a pinion disposed parallel with said shaft and having a length equal to that of said series of gears, a guideway disposed parallel to said pinion and arranged to rock upon the axis of the pinion, a carriage mounted to slide in the guideway, a gear mounted in the carriage and engaging said long pinion and adapted to engage any of said series of gears, a rack supported by the guideway, a pinion journaled on the carriage and engaging the rack, a crank for turning the pinion, and means for locking the rocking guideway and the carriage in adjusted position.

Claim.—1. A burglar-alarm comprising a casing, a firing-arm, a firing-pig, and a cartridge-sleeve holding the said pig in place and adapted to receive a cartridge for discharge by the firing-arm.

2. The combination, substantially as set forth, of a shaft provided with a series of gears of diverse diameters, a pinion disposed parallel with said shaft and having a length equal to that of said series of gears, a guideway disposed parallel to said pinion and arranged to rock upon the axis of the pinion, a carriage mounted to slide in the guideway, a gear mounted in the carriage and engaging said long pinion and adapted to engage any of said series of gears, a rack supported by the guideway, a pinion journaled on the carriage and engaging said rack, a crank for turning said pinion, a detent-pin carried by said crank and adapted to engage selective detent-balls in the guideway, and means for locking the rocking guideway in adjusted position.

3. The combination, substantially as set forth, of a shaft provided with a series of gears of diverse diameters, a second shaft mounted parallel therewith, a pinion upon said second shaft, a guideway disposed parallel with and arranged to rock upon the axis of said second shaft, a carriage mounted to slide in said guideway, an idle gear mounted in said carriage and geared to said second shaft and adapted to engage any of the gears of said series of gears, and means for locking said rocking guideway and the carriage in adjusted position.

4. The combination, substantially as set forth, of a casing, a shaft journaled therein and provided with a series of gears of diverse diameters enclosed by said casing, a pinion mounted in said casing parallel with said shaft and having a length equal to said series of gears, a guideway disposed parallel with said pinion and mounted to rock upon the axis thereof, a carriage arranged to slide in said guideway, an idle gear mounted in said carriage and engaging said pinion and adapted to engage any one of said series of gears, and means for locking the rocking guideway and the carriage in adjusted position.

701,565. TROLLEY-RAIL. WILLIAM E. HARRIS, New York, N. Y. Filed Oct. 19, 1901. Serial No. 79,203. (No model.)

Claim.—1. In a rail, the combination with a flange, of a web provided at the top edge with downwardly-projecting flanges to form a groove, said web having an inward flange at one edge adapted to engage one of the flanges of the web, and a downwardly-projecting flange at the other edge of the tread adapted to fit against the remaining flange of the web, and a screw for securing said tread to the web.

2. In a rail, the combination with a flange, of a web bifurcated at its upper edge, the bifurcated portions terminating in outwardly-projecting flanges, and a tread adapted to be seated upon the web and provided with edge flanges adapted to engage the flanges carried by the web, and a screw for fastening the web and tread together.

3. In a rail, the combination with a flange; of a web bifurcated at its upper edge to form a groove for the reception of an electrical conductor, the bifurcated portions terminating in outwardly-projecting flanges and a tread adapted to be seated upon the web and provided with edge flanges designed to engage the flanges carried by the web and means for fastening the tread and rail together.

701,566. ELECTRIC ALARM. WILLIAM E. HARRIS, New York, N. Y. Filed Feb. 1, 1902. Serial No. 93,904. (No model.)

Claim.—1. A burglar-alarm comprising a casing, a firing-arm, a firing-pig, and a cartridge-sleeve holding the said pig in place and adapted to receive a cartridge for discharge by the firing-arm.

2. A burglar-alarm comprising a casing, a firing-arm, a cartridge-holding sleeve having insulating material separating it completely from the rest of the structure, and electrical connections for the sleeve and the remaining parts of the alarm, the firing-arm serving as a circuit-closer.

3. A burglar-alarm comprising a casing carrying detent-spring elements, a plug mounted in one end of the casing, a fastening device removably arranged in the said plug, and a removable pin passing through the casing, plug, and fastening device.

4. A burglar-alarm comprising a casing, a cartridge-holding element, and a firing-arm carrying both rim and center firing elements, the center-firing element being adjustable.

5. A burglar-alarm comprising a casing having a plug fitted in one end thereof and carrying a spring which is permanently fastened thereto, the said plug having an opening therethrough, a cartridge-holding sleeve removably mounted in the casing and plug, and a firing-arm fastened in the casing and having a portion adapted to engage the said spring.

6. A burglar-alarm comprising a casing having a firing-arm fastened therein, a plug removably mounted in one end of the casing and having a spring fixed thereto which engages a portion of the firing-arm, cartridge-holding means mounted in the casing and plug, and a screw in the said plug to cooperate with the said cartridge-holding means.

701,567. LUBRICATOR. HART HARRIS, Washington, D. C. Filed May 31, 1901. Serial No. 62,907. (No model.)

Claim.—In a lubricator having a receptacle for the oil, means for feeding the oil from said receptacle, a removable closure to said receptacle enlarged into a funnel and a stop-cock between said funnel and receptacle, a vent-valve in said closure adapted to release air from said receptacle, and having a stem rising through said closure, and a cam upon the plug of said stop-cock adapted to engage said valve-stem, and open said valve when said valve-plug is actuated, substantially as described.

701,568. CAR-FINDER. JOHN B. HARRIS, St. Louis, Mo., assignor of two-thirds to Dan W. Morris and Edward Butler, Jr., St. Louis, Mo. Filed Nov. 12, 1901. Serial No. 93,905. (No model.)

Claim.—1. A car-finder, consisting of a frame pivotally supported under the car, a cross-piece supported adjacent the rear end of the frame, means carried by said cross-piece for holding the finder in an elevated position, and means for automatically releasing the finder from the said cross-piece whenever any object is engaged by the forward end of the finder, substantially as specified.

2. A fender, consisting of a frame pivotally supported under the car, a cross-piece 5 supported adjacent to the rear end of the fender, means carried by said cross-piece for engaging the fender to hold it in different positions, rods extending within the fender-frame and projecting in front of the fender, a cross-piece carried by said rods and adapted to first engage any object which may be on the track so that the said rods will be forced rearwardly, means whereby the first-mentioned cross-piece will be operated whenever the said rods are moved and the fender released, and a shield hinged to the said fender and extending upwardly in front of the end of the car, substantially as specified.

3. A car-fender, consisting of a frame pivotally supported by the car, a cross-piece 5 supported under the car, an arm 7 carried by said cross-piece 5 and adapted to engage with the rear end of the fender to hold it in different positions, arms 6 carried by the ends of the cross-piece 5 and extending downwardly, rods 13 supported within the fender-frame and projecting in front thereof, a member 13 carried by said rods 13 in front of the fender, the rear ends of the said rods 13 bearing against the arms 6 so that the said arm will be moved to release the fender whenever any object is encountered by the said member 13, means for holding the arm 7 in contact with the end of the fender, and a suitable shield carried by the fender and extending upwardly in front of the car, substantially as specified.

701,569. SEED-PLANTER. ELIAS F. BRILL, Wichita, Kans., assignor of one-half to R. C. Israel and George W. Israel, Wichita, Kans. Filed Aug. 25, 1900. Serial No. 14,094. (No model.)

Claim.—1. In the herein-described seed-planter, a plow and furrow-opener or blade combined, vertically covered adjustably in the planter-frame, said blade having a hole lengthwise through the lower end, a reel for carrying a long strip of paper with seeds placed therein, and a reel on a post secured to said planter-frame, said long strip of paper with seeds adapted to pass through said hole in said plow and furrow-opener or blade into the furrow.

2. The combination of a seed-planter frame, a vertically-adjustable plow and furrow-opener or blade, having a hole lengthwise thereof, a laterally-adjustable frame, wherein which said seed-planter rides journaled in a yielding frame, a reel shod on a post secured to said adjustable frame, a long strip of narrow paper with seeds twisted therein at desired intervals, wound on said reel, said paper adapted to pass through said hole in said plow and furrow-opener or blade into the furrow.

701,570. CURTAIN-FIXTURE. JAMES JORDAN, JR., and PATRICK J. RAGAN, Hartford, Conn. Filed Aug. 12, 1901. Serial No. 71,721. (No model.)

Claim.—1. A curtain-fixture comprising a sheet-metal plate having an end portion bent to effect the plate proper from said end portion, said end portion being slotted, so that the plate may be adjusted on its support; a bracket having a pair of slots for receiving the plate; and a com-

lever pivoted to the bracket and adapted, when actuated, to bind the bracket and plate together.

2. A curtain-fixture comprising a sheet-metal plate having offset, vertically-slotted ends through which devices may be passed for securing said plate to its support; a sheet-metal bracket having a pair of slots through which the plate is passed; and a sheet-metal cam-lever pivoted to said bracket, substantially as described.

3. The combination, with a sheet-metal plate having its ends slotted to receive fastening devices and also bent to bear against a support and separate the plate from such support, of a sheet-metal bracket formed of a blank having a pair of slots, the end of said blank being bent to bring the slots in alignment with each other; and a device for securing the bracket and plate together.

4. The combination with a sheet-metal plate having offset ends, each provided with a vertical slot for the reception of a fastening device; of a sheet-metal bracket having a pair of registering slots for receiving the plate; and a cam-lever pivoted to the bracket and adapted to clamp said bracket and plate together.

5. The herein-described curtain-fixture comprising a sheet-metal plate having offset ends vertically slotted to receive screws for securing the plate to a support; a cam-lever stamped from sheet metal, and having bearings for the reception of the plate; and a cam-lever stamped from sheet metal and having its inner end adapted to engage the plate between the bearings thereof.

701,571. SHIFTER TOPRAILS. ARTHUR KEMMER, San Francisco, Cal. Filed May 25, 1901. Serial No. 61,416. (No model.)

Claim.—1. In combination with the mast and topmast of a vessel and a stay connecting said mast to an adjacent mast, a top-rail, and means operable from the deck of the vessel for shifting said top-rail under said stay.

2. In combination with the masts of a vessel and a stay connecting them, a top-rail, means for leading down the sail, means for shifting the sail under said stay, and means for hoisting the sail upon the other side of the stay, all of such means being operable from the deck of the vessel.

3. In combination with a topmast and top-rail, parallel guides on said mast, means for securing the sail movably to said guides, means for lowering and hoisting the sail, and means for transferring the lowered sail from one guide to the other.

4. In combination with a topmast and top-rail, a single halyard made fast to the sail-head, a block over which the halyard passes, said halyard having a bight therein, both ends of said halyard being on deck and the sail being hoisted by drawing upon either end, whereby the sail-head may be held to port or starboard, substantially as described.

5. In combination with a topmast and top-rail, a two-sheave block at the masthead, a single-sheave block near the foot of the topmast, and a single halyard-halyard having both ends on deck, and extending from one side of the deck over one sheave of the upper block, thence under the lower block, thence over the other sheave of the upper block, and thence to the other side of the deck, the head of the sail being secured to said halyard, whereby the sail-head may be held to port or starboard.

6. A mast having parallel guide-tracks, a sail movable on either of said tracks, a pivoted switch adapted to coincide with either track, means for hoisting and lowering the sail, and means for throwing the switch.

7. In combination with a mast having parallel guide-tracks upon

which the top-rail travels in hoisting and lowering, a pivoted switch-bar adapted to coincide with either guide-track, a lever attached thereto and leading-ropes from said lever to the deck.

8. In combination with a mast and sail, guides upon which the sail travels in hoisting and lowering, clips secured to the edge of the sail and engaging with one of said guides, and a switch adapted to receive said clips from the guide, and then to transfer them, with the sail, to alignment with the other guide.

9. In a rigging for shifting top-rails, a halyard, a clip connecting the head of the sail to said halyard, a guide-block for said halyard, and a slot in said block to permit the passage of said clip.

10. In a rigging for shifting top-rails, guides on the mast to one of which the sail is connected, a halyard to which the head of the sail is secured, a switch for receiving the sail from one guide and transferring it to the other, and a guide-block for the halyard having a slot to admit and pass the clip which secures the head of the sail to said halyard.

11. In combination with a mast, sail-guides thereon, a pivoted switch for receiving the lowered sail bodily and transferring it under the mast-head stay, and a guide for the free end of said switch.

12. In combination with a mast and topmast, sail-guides secured to the topmast, but bridging to and loosely connected with the mast.

13. In combination with a mast and topmast, parallel sail-guides secured to the topmast, a plate forming part of said guides, and having a loose connection with the mast, a rib on said plate, and a pivoted switch-bar having its free end in engagement with said rib.

701,572. ELECTRIC BELL. HENRY F. KIM, New York, N. Y. Filed Aug. 2, 1901. Serial No. 70,571. (No model.)

Claim.—1. An electromagnet, an armature, a support therefor sustained by the core of the magnet, and constructed and arranged to be sprung on or detached from the core at will, and means to hold the armature so as to move toward the electromagnet or transversely of the same.

2. An electromagnet, an armature, a support therefor sustained by the core of the magnet, and constructed and arranged to be sprung on or detached from the said core at will, means to hold the armature so as to move toward the electromagnet or transversely of the same, and a locking device intermediate the armature and support, whereby the said armature may be maintained in a locked relation.

3. An electromagnet, an armature, a supporting-plate constructed and arranged to be sprung on or detached from the magnet-core at will, means to hold the armature so as to move toward the electromagnet or transversely of the same, and a locking device, one part of said locking means being attached to the armature, and the other portion forming a part of said support.

4. An electromagnet, an armature, a supporting-plate constructed and arranged to be sprung on or detached from the magnet-core at will, means to hold the armature so as to move toward the electromagnet or transversely of the same, and a locking device, consisting of a corrugated disk, attached to the armature, and another portion, consisting also of a corrugated disk, forming a part of said support.

5. An electromagnet, an armature, a spring-plate supported by the core of said magnet, means to hold the armature so as to move toward the electromagnet or transversely of the same, and a locking device, one part of said locking device consisting of a corrugated disk, attached to the armature, and the other part, consisting also of a corrugated disk, supported by said spring-plate.

6. An electromagnet, a spring-plate supported by the core of said magnet, an armature, and a locking device, one member of said locking device, consisting of a disk, attached to the armature, and another member, also consisting of a disk, supported by the said spring-plate, the two members being held together by means passing through the said disks.

7. An electromagnet, a spring-plate supported by the core of said magnet, an armature, and a locking device, one member of said locking device, consisting of a disk, attached to the armature, and another mem-

ber, also consisting of a disk, supported by said spring-plate, the two members being held together by means passing through the said disks and through an extension of the second member of the locking device.

8. An electromagnet, a spring-plate sustained by the core of said magnet, an armature connected with the magnet and mounted to turn, and a locking device consisting with the armature, whereby, upon manipulation, the movable pivoted armature may be rigidly held in any desired adjusted position.

701,573. WOVEN DOUBLE-PILE FABRIC. JOHN KILLAM, Newington, Conn., assignor to Charles A. Wingtholmer, New York, N. Y. Filed Sept. 21, 1901. Serial No. 70,061. (No model.)

Claim.—1. A pile fabric composed of ground warp-threads, filling-threads, and pile-threads arranged independently of each other in pairs upon successive pairs of filling-threads, one left upon each thread, and said pairs arranged in staggered relation between the successive ground warp-threads, substantially as set forth.

2. A double-pile fabric, consisting of upper ground warp-threads, lower ground warp-threads, upper filling-threads, lower filling-threads, and pile warp-threads, two to each ground warp-thread, arranged between the same, said pile warp-threads being looped in pairs upon successive pairs of filling-threads alternately in the top and bottom piece, substantially as set forth.

701,574. THROTTLE-VALVE. GEORGE W. KIM, Marion, Ohio, assignor to the Marion Steam Shovel Company, Marion, Ohio, a Corporation of Ohio. Filed Aug. 12, 1901. Serial No. 71,572. (No model.)

Claim.—1. The combination, with the steam-supply pipe of a steam-engine, of a throttle-valve comprising a casing having a port communicating with that portion of the steam-supply pipe connected with the source of supply, a second port connected with that portion of the steam-supply pipe which is connected with the engine, said valve-casing being also provided with an exhaust-passage, and a valve controlling said ports and adapted to connect the engine-port and exhaust-passage and simultaneously close the port connected with the steam-supply, whereby the steam from the engine may be permitted to return through the steam-supply pipe and escape through the valve and exhaust-passage under control of the valve, substantially as described.

2. A throttle-valve comprising a casing provided with ports communicating with the steam-supply and engine and with an exhaust-passage, and a valve controlling said ports and provided with a by-pass adapted to connect the engine-port and exhaust-passage, said valve being movable to three operative positions; first, to close both the engine-port and exhaust-passage and prevent all movement of the steam; second, to close the steam-supply and open communication between the engine-port and exhaust-passage; and third, to open communication between the steam-supply and engine-port and close the exhaust-passage, substantially as described.

3. A throttle-valve comprising a casing provided with ports communicating with the steam-supply and engine and with an exhaust-passage, and a valve controlling said ports and provided with a by-pass adapted to connect the engine-port and exhaust-passage, said valve being movable to three operative positions; first, to close both the engine-port and exhaust-passage and prevent all movement of the steam; second, to close the steam-supply and open communication between the engine-port and exhaust-passage; and third, to open communication between the steam-supply and engine-port and close the exhaust-passage, said valve being also movable in its second and third positions to regulate the passage of steam, substantially as described.

4. A throttle-valve comprising a valve-casing having a valve-cham-

her closed at one end and opened at the other end for the admission of steam, said casing having an intermediate chamber communicating with the engine and with the valve-chamber, in combination with a valve controlling communication between the valve-chamber and the intermediate chamber, said valve having a steam-passage therethrough, whereby both ends of the valve are subjected to steam-pressure to partially balance the same, and a valve-rod connected to said valve and passing through the inlet end of the casing, said valve being adapted to close the valve-ports by a movement toward the said inlet end, whereby the unbalanced pressure on said valve tends to close the same, substantially as described.

5. A throttle-valve comprising a casing having a cylindrical valve-chamber closed at one end and connected at the other end with a steam-supply, said casing being provided with an annular chamber having ports connecting with the valve-chamber and also connected with the engine, and a second annular chamber having an exhaust-opening and ports connecting with the valve-chamber, in combination with a piston-valve having a longitudinal opening and a body portion adapted to control the ports communicating with the engine, and a reduced portion adapted to establish communication between the engine-ports and the ports communicating with the exhaust-chamber, substantially as described.

6. A throttle-valve comprising a valve-casing having a cylindrical body portion closed at one end and connected with the steam-supply at the other, said casing having an annular chamber communicating with the engine and provided with ports opening into the valve-chamber, and a second annular chamber also provided with ports opening into the valve-chamber and connected with the exhaust, and a valve having a cylindrical body provided with a longitudinal opening to balance the valve and with a reduced intermediate portion, whereby communication may be established between the engine-ports and the ports of the exhaust-chamber, substantially as described.

701,575. BALING-PRESS. MINHAM KIMMER, Lynchburg, Va. Filed Aug. 24, 1901. Serial No. 73,116. (No model.)

Claim.—1. In a machine of the character described, a pressure chamber or crib, a follower and mechanism for compressing the material comprising a pair of eccentric rollers or cams arranged to roll on each other and thereby operate said follower, and a worm operating between said eccentric rollers and arranged to rotate the same, substantially as described.

2. In a machine of the character described, a pressure chamber or crib, a follower or bed-plate for compressing the material therein, an eccentric roller or cam carried by said follower or bed-plate, and a second roller suitably supported, said rollers rolling on each other, and a

worm operating between said rollers for rolling one of them on the other, substantially as described.

3. In a machine of the character described, a pressure chamber or crib, and mechanism for compressing the material therein comprising a pair of eccentric rollers or cams, a pair of rollers in rolling contact therewith, and a worm for operating said rollers, substantially as described.

4. In a machine of the character described, a pressure chamber or crib, and mechanism for compressing the material therein comprising a pair of eccentric rollers or cams, a pair of eccentric rollers or cams in contact with the first-mentioned rollers or cams, the said rollers having gears formed thereon, and a worm meshing with and rotating said geared rollers or cams, substantially as described.

5. In a machine of the character described, a pressure chamber or crib, and mechanism for compressing the material therein comprising a pair of eccentric rollers or cams arranged to roll on each other, and a worm arranged to rotate said rollers and capable of moving to accommodate itself to the movement of said rollers or cams, substantially as described.

6. In a machine of the character described, a pressure chamber or crib and mechanism for compressing the material therein comprising two pairs of eccentric rollers or cams having gearing thereon, a shaft provided with a worm near each end thereof for meshing in the gearing on said eccentric rollers and arranged to rotate the same, substantially as described.

7. In a machine of the character described, a pressure chamber or crib, and mechanism for compressing the material therein comprising two pairs of eccentric rollers or cams arranged to roll on each other and having worm-wheels thereon, a shaft having a worm near each end thereof meshing between the worm-wheels on said rollers and means for rotating said shaft, substantially as described.

8. In a machine of the character described, a pressure chamber or crib and mechanism for compressing the material therein comprising two pairs of eccentric rollers or cams arranged to roll on each other whereby the axes of one set have vertical movement, worm-wheels forming part of said rollers, a shaft having a worm near each end thereof arranged to gear with the worm-wheels on said rollers, said shaft capable of movement as the axis of one pair of said rollers move, substantially as described.

9. In a machine of the character described, a pressure chamber or crib and mechanism for compressing the material therein comprising two pairs of eccentric rollers or cams arranged to roll on each other whereby the axes of one set have vertical movement, worm-wheels forming part of said rollers, a shaft having a worm near each end thereof arranged to gear with the worm-wheels on said rollers, means for supporting said shaft capable of movement to adapt said worms to the movement of said rollers, substantially as described.

10. In a machine of the character described, a pressure chamber or crib, a follower or bed-plate for compressing the material therein, two pairs of eccentric rollers or cams meshing with said follower or bed-plate and arranged to move the latter as they roll on each other, worm-wheels forming part of said rollers or cams, a shaft having a worm near each end thereof meshing with the worm-wheels on said rollers or cams, a worm-wheel on said shaft and a shaft and worm for operating said worm-wheel, substantially as described.

11. In a machine of the character described, a pressure chamber or crib, a follower or bed-plate for compressing the material therein, two pairs of eccentric rollers or cams meshing with said follower or bed-plate and arranged to move the latter as they roll on each other, worm-wheels forming part of said rollers or cams, a shaft having a worm near each end thereof meshing with the worm-wheels on said rollers or cams, a worm-wheel on said shaft and a shaft and worm for operating said worm-wheel, the said shafts and worms having movement corresponding to the movement of the follower or bed-plate, substantially as described.

12. In a machine of the character described, two cribs having walls forming a pressure-chamber of the same internal dimensions and of uniform size and arranged to telescope or slide one in the other during the compression of the material, substantially as described.

13. In a machine of the character described, a crib having one part with its members projecting therefrom with spaces left between them, and a second part having members also projecting therefrom and telescoping between the members of the opposing part, substantially as described.

14. In a machine of the character described, a crib having a stationary part with its members projecting downward therefrom with spaces left between them, and a second part having members projecting upward and telescoping between the members of the upper part, substantially as described.

15. In a machine of the character described, a pressure chamber or crib and a frame for use therewith having an inwardly-curved or convex

portion tending to form a corresponding concave depression in the bale, substantially as described.

16. In a machine of the character described, a pressure chamber or crib and a knockdown frame for use therewith having an inwardly-curved or convex portion tending to form a corresponding concave depression in the bale, substantially as described.

17. In a machine of the character described, a pressure chamber or crib and a knockdown frame for use therewith having an inwardly-curved portion adapted to form a corresponding concave depression in the bale, and openings or slots in said frame permitting the air to escape as the material is compressed, substantially as described.

18. In a machine of the character described, a pressure chamber or crib, a follower or bed-plate having means for supporting the bottom and sides of a pan or section of the bale-covering, a removable frame consisting with said supporting means, and means for compressing the material into said pan or section, substantially as described.

19. In a machine of the character described, a pressure chamber or crib, a follower or bed-plate having a recess formed therein arranged to support the bottom and sides of a pan or section of the bale-covering, a removable frame consisting with said recess and forming a continuation thereof, and means for compressing the material into said pan or section, substantially as described.

20. In a machine of the character described, a pressure chamber or crib, a follower or bed-plate having a recess formed therein for supporting the bottom and sides of a pan or section of the bale-covering, a knockdown frame arranged to be supported above said recess and forming a continuation thereof, and means for compressing material into said frame and pan or section of the bale-covering, substantially as described.

21. In a machine of the character described, a pressure chamber or crib, means for compressing material between pans or sections of the bale-covering arranged in said pressure chamber or crib, and means for holding a fastening-strip against said pans or sections of the bale-covering, substantially as described.

22. In a machine of the character described, a pressure chamber or crib, means for compressing material between pans or sections of the bale-covering arranged in said pressure chamber or crib, and detachable bars for holding a fastening-strip against said pans or sections of the bale-covering, substantially as described.

701,576. BALE-COVERING. MINHAM KIMMER, Lynchburg, Va. Filed Aug. 24, 1901. Serial No. 73,116. (No model.)

Claim.—1. A bale-covering, comprising a top and a bottom dash having locking-flanges on all of its edges, and a substantially continuous strip having flanges coating with the locking-flanges on the top and the bottom and locking or fastening them together, substantially as described.

2. A bale-covering comprising a top and a bottom having locking-flanges thereon, and a strip having flanges coating with the flanges on the top and bottom and locking or fastening them together, and provided with means for locking or fastening its ends together, substantially as described.

3. A bale-covering, comprising a top and a bottom made into pan shape with locking-flanges thereon, and a substantially continuous strip surrounding the bale and having flanges thereon coating with the locking-flanges on the top and bottom and thereby locking the latter together, substantially as described.

4. A bale-covering comprising a top and a bottom made into pan shape with flanges thereon, and a strip surrounding the bale and having flanges thereon coating with the flanges on the top and bottom and thereby locking the latter together, and provided with a tongue and coating means for locking its ends together, substantially as described.

701,577. LIGHTNING-CONDUCTOR. FRANK E. KLINE, Dresden, Germany. Filed Mar. 31, 1900. Serial No. 10,911. (No model.)

Claim.—1. A horn-shaped lightning-arrester in which there are provided near where the arc is to be formed, paramagnetic bodies consisting of sheets which partly surround the horn but leave free their inner edges which face each other, substantially as herein described.

2. Is a lightning-arrester, the combination of two horn-shaped discharging-plates *c c* and two paramagnetic bodies in the form of sheets which partly surround said plates, substantially as and for the purpose herein described.

701,578. MACHINE FOR CUTTING LOOPS OF FINE FABRIC. JOHN D. KNOWLES, Westbrook, Me., assignor to Sanford Mills, Sanford, Me., a Corporation of Maine. Filed Apr. 26, 1901. Serial No. 672,008. (No model.)

Claim.—1. In a machine for cutting the loops of a pile fabric, a framework, a bed over which the pile fabric is passed, and a rotary and reciprocating shaft having thereon a plurality of cutters or knives.

2. In a machine for cutting the loops of pile fabric, a framework, a bed over which the pile fabric is passed, a rotary and reciprocating shaft having thereon a plurality of cutters or knives, a rotatable roll beneath and parallel with said shaft of cutters or knives to support the fabric in position to be cut.

3. In a machine for cutting the loops of pile fabric, a rotating shaft having a gang of bladed cutters, means to reciprocate said shaft longitudinally, and means to support the back of the fabric at the line opposite where the bladed cutters act to enter and cut the loops, substantially as described.

4. In a machine for cutting the loops of pile fabric, the following instrumentalities, viz., a rotating shaft having a gang of bladed cutters, means to reciprocate said shaft longitudinally during its rotation, means to sustain the fabric parallel with the axis of rotation of the rotating cutter-carrying shaft, and tension means acting upon the fabric to hold the same stretched over the support sustaining the fabric.

5. In a machine for cutting the loops of pile fabric, a gang of blades cutters mounted upon a shaft extended across the line of travel of the fabric, means to rotate said shaft and its cutters, combined with a shaft having a gang of cross or traverse cutters, said shaft being arranged at an angle to the shaft carrying the gang of main cutters, and means to reciprocate the shaft carrying said cross cutters to and fro across the fabric in the direction of its travel through the machine, substantially as described.

6. In a machine for cutting the loops of pile fabric, a carriage, a shaft mounted in said carriage, said shaft having one or more gangs of blades cutters, means to rotate said shaft and to move said carriage transversely with relation to the direction of travel of the fabric through the machine, whereby said cross or traverse cutters are made to cut transversely across a field of loops of the fabric, substantially as described.

7. In a machine for cutting the loops of pile fabric, a gang of blades cutters fixed upon a shaft extended across the line of travel of the fabric, a series of cross or traverse blades cutters fixed upon a shaft more or less in line with the direction of travel of the fabric, and means to sustain the back of the fabric opposite the points where the said blades cutters act to cut the loops thereof, means for reciprocating said cross or traverse cutters to and fro across the face of the fabric, and means for guiding and stretching the fabric being cut, substantially as described.

8. In a machine for cutting the loops of pile fabric, a gang of blades cutters fixed upon a shaft extended across the line of motion of the fabric, a gang of cross or traverse blades cutters fixed upon a shaft located more or less in line with the direction of travel of the fabric, means to sustain the back of the fabric opposite the points where the said blades cutters act to cut the loops thereof, means for reciprocating said cross or traverse cutters to and fro across the face of the fabric, means for guiding and stretching the fabric being cut, and means for automatically feeding the fabric through the machine, substantially as described.

9. In a machine for cutting the loops of pile fabric, a gang of blades cutters, and a shaft carrying them, said shaft being extended across the line of motion of the fabric, and a gang of cross or traverse blades cutters, and a shaft carrying them, said shaft occupying a position in the direction of the line of travel of the fabric through the machine, and means for moving both gangs of said cutters laterally with relation to the face of the fabric as the same is being fed beneath said cutters, substantially as described.

10. In a machine for cutting the loops of pile fabric, a shaft having a gang of blades cutters, means to both rotate and reciprocate said shaft, means to sustain the back of the fabric in a line substantially parallel to the axis of rotation of the cutter-carrying shaft, tension devices for keeping the fabric stretched over the means for supporting the same during the time the loops are being cut, and means to change the relative positions vertically of the support for the back of the fabric and the gang of cutters, substantially as described.

11. In a machine for cutting the loops of pile fabric, means to support the fabric to be cut, a rotating shaft having a gang of blades cutters thereon, a hub secured to the shaft carrying said cutters, said hub having an annular groove, and means operating with said groove to reciprocate automatically said shaft longitudinally in its journals, substantially as described.

12. In a machine for cutting the loops of pile fabric, a rotary shaft located in the line or direction of travel of the fabric, a gang of blades cutters or traverse cutters applied to said shaft, a carriage to support said shaft, guides to direct the movement of said carriage, and means for reciprocating said carriage on said guides across the machine, substantially as described.

13. In a machine for cutting the loops of pile fabric, a shaft located in the line or direction of travel of the fabric, a gang of blades cutters or traverse cutters secured to said shaft, a carriage to support said shaft, guides to support said carriage, and direct its movements transversely with relation to the travel of the fabric through the machine, means to reciprocate said carriage in said guides, and means to rotate and lower said guides, substantially as described.

14. In a machine for cutting the loops of pile fabric, a shaft located in the line or direction of travel of the fabric, a gang of blades cutters mounted on said shaft, a carriage to support said shaft, transverse guides in which said carriage is mounted, means to move said carriage in said guides, temple-plates to support the fabric being acted upon by said gang of cutters and pressure-plates acting upon the face of the fabric in front of and behind said temple-plates, substantially as described.

15. In a machine for cutting the loops of pile fabric, a shaft, a carriage containing said shaft, a series of blades cutters mounted on said shaft, transverse guides in which said carriage is mounted, a cord or flexible connection secured to said carriage, a reel, and means to move it in one end and then the opposite direction to wind and unwind said cord or flexible connection and thereby reciprocate said carriage to and fro in said guides, substantially as described.

16. In a machine for cutting the loops of pile fabric, a plurality of

shafts, a movable carriage containing said shafts, gangs of blades cutters mounted on said shafts, transverse guides in which said carriage is mounted, a flat temple-plate extended transversely with relation to the machine in support the back of the fabric, and a pressure-plate acting upon the face of the fabric at opposite edges of said temple-plate, substantially as described.

17. In a machine for cutting the loops of pile fabric, a shaft having a series of blades cutters, temple-rolls to support the back of said fabric opposite said cutters, pressure-plates extended across the machine and acting upon the face of the fabric to hold the same down on said temple-rolls, and means for adjusting the effective pressure of said pressure-plates upon the fabric, substantially as described.

701,579. METALLURGICAL. HENRY C. KENOW, Milwaukee, Wis. Filed Feb. 17, 1902. Serial No. 94,341. (No model.)

Claim.—A metallic seal comprising a flexible metal strip having a plurality of prongs struck up out of one end thereof all clear of one another from the strip to their outer extremities, and a compressible metal plug molded on said strip to embed and conceal the prongs of same, the plug-shank being engageable with an aperture provided in the other end of the aforesaid strip.

701,580. PNEUMATIC-SURFACER FRAME. EUGENE C. KOTHE, New York, N. Y. Filed July 17, 1901. Serial No. 66,992. (No model.)

Claim.—1. A post, an arm rotatably mounted thereon, a drum carried by said arm, rollers carried by said post and arm, a connection passing around said rollers and leading from an end of said arm to said drum, and means for rotating the latter, in combination with a carriage mounted on said arm, trolleys on the upper and lower portion of said carriage adapted to contact with tracks on said arm, and a set of rollers mounted in the lower portion of said carriage and adapted to contact with the lower of said tracks.

2. The combination of a post, an arm secured to a sleeve rotatably mounted thereon, a carriage movably supported on said arm, a drum carried by said arm, rollers carried by said post, a roller secured to bearings on said sleeve, said bearings projecting therefrom in an opposite direction to said arm, a connection passing around each of said rollers and leading from an end of said arm to said drum, and means for rotating the latter.

3. In a surface-frame, a post, a sleeve surrounding said post and adapted to be moved thereupon, an arm projecting from said sleeve, and secured thereto, tracks formed on the upper and lower surfaces of said arm, a carriage movable upon said tracks, said carriage having strips on either side thereof, rods supported by said strips, plates carried by said rods, a pneumatic tool supported upon said plates and means for raising and lowering said arm.

4. In a surface-frame, a post, an arm projecting laterally therefrom, means for enabling said arm to be turned on said post, a cap rotatably mounted on said post, rollers mounted on said cap, a drum mounted on said arm, a connection leading from an end of said arm to said drum and passing over said rollers, a carriage movable on said tracks and having strips on either side thereof, rods supported by said strips, plates carried by said rods and a pneumatic tool supported between said plates.

5. In a surface-frame, a post, an arm rotatably mounted thereupon,

and a carriage mounted on said tracks adapted to support a pneumatic tool.

6. In a surface-frame, a post, an arm rotatably mounted thereupon, said arm consisting of a plurality of T-beams braced at intervals throughout their length, the central flanges of the upper and lower T-beams flaring upwardly and downwardly respectively and forming a track, a carriage having trolleys at its upper and lower portion and adapted to travel on said track and means for raising and lowering said arm.

7. In a surface-frame, a post, a cap rotatably mounted thereon, and carrying a plurality of rollers, a sleeve rotatably mounted on said post, an arm projecting from said sleeve and having a track thereon, a carriage adapted to travel upon said track, a drum mounted on said arm, a roller carried by said sleeve, rollers journaled in said carriage, and bearing against said track for preventing lateral motion and a connection secured to one end of said arm, and passing around said rollers to said drum, in combination with a pneumatic tool carried by said carriage, and means for rotating said drum.

8. The combination of a laterally-extending arm, having an upper and lower track thereon, a carriage movable on said tracks, strips on either side of said carriage, rods supported by said strips, plates carried by said rods and a pneumatic tool supported between said plates.

9. The combination of a laterally-extending rotatable arm, having tracks thereon, a carriage mounted on said tracks, a roller carried on the lower portion of said carriage and adapted to contact with the lower one of said tracks, other rollers carried by said carriage and adapted to contact with the opposite sides of said lower track, said carriage having strips on either side thereof, rods supported by said strips, plates carried by said rods and a pneumatic tool supported between said plates.

10. The combination of a hollow supporting-post adapted to serve as an air-reservoir, a collar on the upper portion of said post, a cap rotatably mounted on said collar, ball-bearings intermediate said cap and collar, an inlet-pipe for compressed air leading through said cap to said reservoir, rollers journaled in said cap, a sleeve rotatably mounted on said post, an arm projecting from said sleeve, a drum supported upon said arm, and a connection leading from a point at or near the extremity of said arm around said rollers to said drum.

11. The combination of a post, a laterally-extending arm rotatably mounted thereupon and having an upper and lower track thereon, a carriage movable upon said tracks, strips on either side of said carriage, rods supported by said strips, plates carried by said rods, rollers carried by said post, a connection passing around said rollers, and leading from said arm to said drum and means for rotating the latter.

12. The combination of a post, a sleeve rotatably mounted thereon, an arm secured to said sleeve and consisting of upper and lower T-beams, a bearing 4 interposed between the inner ends of said beams, braces 17 and 18 interposed between the intermediate and outer ends of said beams, arms 26 secured to said beams near their inner extremities and provided with a gear-wheel and drum rotatably mounted thereon, rollers-and-pawl mechanism for operating said drum, legs 44 projecting from said sleeve in a direction opposite to said drum, a roller mounted in said legs, braces 45 extending from said legs 44 to said arm 26, a cap rotatably mounted on the upper portion of said post, rollers carried by said cap, a connection from said drum passing around the rollers carried by said cap, thence under the roller carried by said leg and thence over another set of rollers carried by said cap, said connection having one end secured to the extremity of said arm and the other extremity adapted to be wound upon said drum and a carriage mounted on said arm.

13. The combination of a post, a sleeve rotatably mounted thereon, an arm projecting laterally from said sleeve and having tracks thereon, a roller mounted on said sleeve and extending in a direction opposite to said arm, a drum carried by said arm, a cap rotatably mounted on the upper portion of said post, two series of rollers carried by said cap and a connection extending from said drum around one pair of the rollers carried by said cap, thence downwardly around the roller carried by said sleeve, thence upwardly over the other set of rollers carried by said cap, the outer extremity of said connection being secured to an end of said arm.

14. The combination of a post, a sleeve rotatably mounted thereon, an arm projecting laterally from said sleeve and having tracks thereon, a roller mounted on said sleeve and extending in a direction opposite to said arm, a drum carried by said arm, a cap rotatably mounted on the upper portion of said post, two series of rollers carried by said cap, a connection extending from said drum around one pair of the rollers carried by said cap, thence downwardly around the roller carried by said sleeve, thence upwardly over the other set of rollers carried by said cap, the outer extremity of said connection being secured to an end of said arm.

and a carriage mounted on said tracks adapted to support a pneumatic tool.

15. The combination of a hollow supporting-post adapted to serve as an air-reservoir, a sleeve rotatably mounted on said post, an arm projecting laterally from said sleeve and adapted to support a carriage for a pneumatic tool, a roller mounted on said sleeve, a cap rotatably supported on the upper portion of said post, a drum carried by said arm, a plurality of sets of rollers carried by said cap, a connection leading from said drum around one set of rollers in said cap, thence around the roller carried by said sleeve, thence upwardly over the other set of rollers carried by said cap, the outer extremity of said connection being secured to an end of said arm.

16. The combination of a post, an arm rotatably mounted thereon and having upper and lower tracks thereupon, a carriage movable on said tracks and consisting of triangular-shaped frames, rollers journaled in the apices of said frames, strips secured to either side of said carriage, rods supported in said strips, plates carried by said rods and a pneumatic tool supported between said plates.

17. The combination of a post, an arm rotatably mounted thereon and having upper and lower tracks thereupon, a carriage movable on said tracks and consisting of triangular-shaped frames, rollers journaled in the apices of said frames, strips secured to either side of said carriage, rods supported in said strips, plates carried by said rods and a pneumatic tool supported between said plates, in combination with rollers mounted in the lower portion of said carriage on either side of said lower track, said rollers being adapted to contact with said track and prevent undue lateral motion of said carriage.

18. The combination of a hollow supporting-post adapted to serve as an air-reservoir, a laterally-extending arm rotatably mounted on said post and having tracks thereon, a carriage movable on said tracks, rods rotatably supported from said carriage, plates carried by said rods, a pneumatic tool supported between said plates and a hose leading from said post to said pneumatic tool.

19. The combination of a hollow supporting-post adapted to serve as an air-reservoir, a laterally-extending arm rotatably mounted on said post and having tracks thereon, a carriage movable on said tracks, rods rotatably supported from said carriage, plates carried by said rods, a pneumatic tool supported between said plates and a hose leading from said post to said pneumatic tool, in combination with means for raising and lowering said arm and carriage.

20. The combination of a hollow supporting-post adapted to serve as an air-reservoir, a laterally-extending arm rotatably mounted on said post, a carriage movable on said arm, rods supported from said carriage, plates carried by said rods, a pneumatic tool supported between said plates, a hose leading from said post to said pneumatic tool, a drum carried by said arm, rollers carried by said post and a connection leading from the end of said arm around said rollers to said drum.

701,581. VARIABLE-SPEED MECHANISM. ARTHUR LUTHER, Braintree, England. Filed Jan. 22, 1902. Serial No. 66,799. (No model.)

Claim.—1. A variable-speed mechanism comprising a rotatable base having transverse stationary bearings for said transverse, a shaft having

In bearings in said transmission, a second shaft parallel with that first mentioned, stationary bearings for said second shaft, two sets of gear-wheels of different diameters each set fast on one of said shafts with those of each set opposite to those of the other set but at same distance apart therefrom, loose pinions and bearings therefor so located in said box that by turning the latter either of the said pinions may be brought into gear with one of the gear-wheels of each set, and reversing mechanism comprising bevel-wheels and a sliding clutch on said second shaft, substantially as herein described.

2. A variable-speed mechanism comprising a rotatable box having transmission, stationary bearings for said transmission, a shaft having its bearings in said transmission, a second shaft parallel with that first mentioned, stationary bearings for said second shaft, two sets of gear-wheels of different diameters each set fast on one of said shafts with those of each set opposite to those of the other set but at same distance apart therefrom, loose pinions and bearings therefor so located in said box that by turning the latter either of the said pinions may be brought into gear with one of the gear-wheels of each set, means for turning the box, and means for indicating the position of said box with respect to the shafts, substantially as herein described.

3. A variable-speed mechanism comprising a rotatable box having transmission, stationary bearings for said transmission, a shaft having its bearings in said transmission, a second shaft parallel with that first mentioned, stationary bearings for said second shaft, two sets of gear-wheels of different diameters each set fast on one of said shafts with those of each set opposite to those of the other set but at same distance apart therefrom, and loose pinions and bearings therefor so located in said box that by turning the latter either of the said pinions may be brought into gear with one of the gear-wheels of each set, substantially as herein described.

4. A variable-speed mechanism comprising a rotatable box having transmission, stationary bearings for said transmission, a shaft having its bearings in said transmission, a second shaft parallel with that first mentioned, stationary bearings for said second shaft, two sets of gear-wheels of different diameters each set fast on one of said shafts with those of each set opposite to those of the other set but at same distance apart therefrom, loose pinions and bearings therefor so located in said box that by turning the latter either of the said pinions may be brought into gear with one of the gear-wheels of each set, reversing mechanism comprising bevel-wheels and a sliding clutch on said second shaft, means for turning the box and means for indicating the position of said box with respect to the shafts, substantially as herein described.

701,582. TRUCK. WILLIAM E. LAYNE, Newark, N. J. Filed Feb. 14, 1902. Serial No. 94,692. (No model.)

Claim.—1. A truck, comprising a bar at one end, a pair of supporting-wheels connected with said bar, a retaining-structure at the other end of said truck, a supporting-wheel connected with said structure, and a transverse supporting-frame for supporting a package, consisting, essentially, of a horizontal and centrally-arranged connecting-piece between said bar and said structure, a standard on said structure at right angles, or approximately so, to said central bar, and a pair of supporting-pieces between the upper portion of said standard and said bar, all arranged to form a right-angled triangle when viewed from the side and its hypotenuse forming a support for the package, substantially as and for the purposes set forth.

2. A truck, comprising a bar at one end, a pair of supporting-wheels connected with said bar, a retaining-structure at the other end of said truck, a central-frame connected with said structure, a wheel journaled in said central-frame, and a transverse frame for supporting a package, consisting, essentially, of a horizontal and centrally-arranged connecting-piece between said bar and said structure, a standard on said structure at right angles, or approximately so, to said central bar, and a pair of supporting-pieces between the upper portion of said standard and said bar, all arranged to form a right-angled triangle when viewed from the side and its hypotenuse forming a support for the package, substantially as and for the purposes set forth.

3. The herein-described truck, consisting of a bar 2, a bearing means connected with said bar, an axle arranged in said bearing means and secured to said bar 2, receiving-cockets 10, 11 and 12 on said bar, a fixture 16, a receiving-cocket 17 on said fixture, a connecting rod or piece between said cockets 10 and 17, a swivel-wheel connected with said fixture 16, a receiving-cocket 17 on said fixture, a standard 20 in said cocket 17, and connecting-pieces between said cockets 11 and 12 and the upper portion of said standard, to provide a supporting-frame for the support of a package, substantially as and for the purposes set forth.

4. The herein-described truck, consisting of a bar 2, a bearing means connected with said bar, an axle arranged in said bearing means and secured to said bar 2, receiving-cockets 10, 11 and 12 on said bar, a fixture 16, a receiving-cocket 17 on said fixture, a connecting rod or piece between said cockets 10 and 17, a swivel-wheel connected with said fixture 16, a receiving-cocket 17 on said fixture, a standard 20 in said cocket 17, a best part 20 on the upper end of said standard, a T-lying connected with said best part 20, and angularly-connecting pieces 23 and 24 between the respective ends of said T-lying and the said cockets 11 and 12, the whole forming a triangularly-shaped trans-frame for the support of a package, substantially as and for the purposes set forth.

701,583. LOCK AND EYE. SARAH W. F. LEE, East Orange, N. J. Filed Feb. 4, 1902. Serial No. 92,110. (No model.)

Claim.—A fastening device of the lock-and-eye type, and composed of two parts, the eye part being oblong or flat-shaped in form and provided at one end with a loop or ring, and at one side and adjacent to the opposite end with a loop or ring, the other part consisting of a lock and body or lock portion, the lock being wider than the transverse width of the flat or oblong portion of the eye part, and provided with a narrow shank, and the lock or body portion being provided with rings or loops, substantially as shown and described.

701,584. WRENCH. DEWEY B. LEE, Springfield, Mass., assignor to Union Manufacturing & Specialty Company, Buffalo, N. Y., a Corporation. Filed Mar. 7, 1902. Serial No. 94,691. (No model.)

Claim.—1. A blank for the sliding jaw of a wrench comprising a body portion adapted to be folded on itself to embrace the chuck of the wrench, laterally-extending strips on said blank integral therewith, adapted to be bent into an angular shape to form bearings in which the jaw is supported, two jaw projections on said blank, and means for securing the latter together, side by side.

2. A blank for the sliding jaw of a wrench comprising a body portion adapted to be folded on itself to embrace the chuck of the wrench, a laterally-extending strip on each side of the blank, that on one side thereof being bent in an opposite direction to that on the other to form an angular bearing for the jaw; projections on each side of the blank which, together, constitute the jaw proper, and means for securing these projections together.

3. A blank for the sliding jaw of a wrench comprising a body-portion adapted to be folded on itself to embrace the chuck of the wrench, two laterally-extending strips on opposite sides of said blank, the lower edge of one and the upper edge of the other lying in the same plane, said strips, when bent to angular form, constituting a bearing for the ends of a jaw.

701,585. RING-MARKING MACHINE. LOUIS LERN, New York, N. Y. Filed Nov. 12, 1901. Serial No. 92,590. (No model.)

Claim.—1. In a finger-ring-stamping machine, a base, standards on the base, a die-bar having an angular portion, a plate on the base and having a notch to receive said angular portion, clamping-jaws for holding and centering a ring and a plunger.

2. In a ring-stamping machine a base, a standard on the base, a plunger movable in the standard, a lever for operating the plunger, movable jaws below the plunger, a die-bar having an angular portion and a plate on the base, having a notch to receive said angular portion.

701,586. SNAP-HOOK. DEWEY B. LEE, East Orange, N. J. Filed Sept. 14, 1901. Serial No. 78,571. (No model.)

Claim.—1. A snap-hook having a horizontal barrel, a sliding bolt therein and a vertical locking-pin carried by the bolt and passing through the same and engaging the hook for locking the sliding bolt.

2. A snap-hook having a recess or socket, a sliding bolt therein, and a vertical locking-pin carried by the bolt and engaging the socket to lock the bolt.

3. A snap-hook, having a socket, a spring sliding bolt arranged in the hook, a vertical locking-pin arranged in the bolt and engaging the socket to lock the bolt, and a spring for forcing the locking-pin into engagement with the socket.

701,587. AFFILIATOR. ALEXANDER LEVI, Brighton, Germany. Filed Feb. 2, 1901. Serial No. 94,690. (No model.)

Claim.—1. In an instrument for introducing liquid medicaments the combination of a straight catheter made of soft India-rubber tapering toward the end, which is closed, and having numerous fine capillary apertures opening externally and a central longitudinal bore, having no communication with the capillary apertures, essentially as described.

2. In an instrument for introducing liquid medicaments the combination of a straight catheter made of soft India-rubber having a heart-shaped head, which is closed, and having numerous fine capillary apertures opening externally and a central longitudinal bore, having no communication with the capillary apertures, essentially as described.

701,588. WALL OR FENCE. GUYARD LEMAS, Montreal, N. E. J. Filed Apr. 4, 1901. Serial No. 94,700. (No model.)

Claim.—1. A wall, fence or analogous structure, composed of a single thickness of tiles or bricks, laid in mortar between appropriate supports, and longitudinal strips of hard-metal wholly embedded in the mortar between the courses and not united to said supports, substantially as described.

2. A wall, fence, &c., composed of thin tiles laid on edge between suitable supports, in mortar; and strips of hard-metal wholly embedded in the mortar between the courses and not united to said supports, substantially as described.

3. A structure composed of a single thickness of laterally-perforated

tiles or blocks, laid in mortar between appropriate supports, and longitudinal strips of hard-metal embedded in the mortar between the courses and not united to said supports, substantially as described.

4. A series of supporting-posts, substantially T-shaped in section; a structure of thin tiles or bricks laid in mortar between such supports, the end tiles of each course entering the channels therein; and strips of hard-metal embedded in the mortar between the courses, substantially as described.

5. A series of supporting-posts substantially T-shaped in cross-section; a structure of thin, perforated tiles laid in mortar between such supports, the end tiles of each course entering the channels therein; and strips of hard-metal embedded in the mortar between the courses and an appropriate cap or coping topping the structure, substantially as described.

701,589. GAS-BRADING MACHINE. ANDREW W. LEVINSKY, Alameda, Cal. Filed Dec. 15, 1901. Serial No. 94,618. (No model.)

Claim.—1. In an automatic gas-brading machine the combination of a rotatable support, an upper and lower set of chucks carried thereon, means whereby the upper chucks may be revolved independently of the drum, and means including a bell-crank lever having one arm connected with the spindle of the lower chuck, and a cam-surface in the path of the end of the other arm of the lever, whereby a lower chuck may be gradually raised to engage and hold a can interspersed between said sets of chucks.

2. In a gas-brading machine the combination of revolvable upper and lower chucks, each of said lower chucks provided with a bell-crank lever having a longer curved arm, the shorter arm of said lever connected to the spindle of said lower chuck in such manner that when the longer curved arm is oscillated in one direction the lower chuck will be made to gradually approach its respective upper chuck and hold a can interspersed therebetween.

3. In an automatic gas-brading machine the combination of a revolving support, rotating chucks thereon between which the cans are held and revolved independently of the support, pivoted arms carrying cam-rollers and means upon said revolving support whereby said pivoted arms are engaged to hold said cam-rollers against the can.

4. In a gas-brading machine, a revolvable drum, rotating chucks thereon between which the cans are held and revolved, pivoted arms carrying cam-rollers, a cam upon each of said arms and means whereby said cam may be engaged to bring the cam-roller into and hold it in engagement with the can.

5. In a gas-brading machine, the combination of a revolving support or drum, means thereon for holding and revolving cans, rollers with which the flanges of said cans are adapted to be engaged and crimped, a cam-surface in connection with said rollers and means upon the drum engaging said surface whereby said rollers are held against the passing cans.

6. In a gas-brading machine, the combination of a revolving drum, means thereon for holding and revolving cans, pivoted arms carrying cam-rollers, a plate on each of said arms a cam-surface on said plate and means by which said guide may be engaged to hold a cam-roller against a passing can.

7. In a can-handling machine the combination of a revolving drum, means thereon for holding and revolving cans, arms carrying cam-rollers, a plate pivoted on each of said arms, a drum cam-roller on said plate, a projection on the drum adapted to engage said rollers to hold the canner against the can and means whereby the pressure of said canner on the can may be regulated.

8. In a can-handling machine the combination of a revolving drum, upper and lower sets of cheeks carried thereon and concentric therewith, connections with a source of power whereby said drum and cheeks are revolved independently of each other and in the same direction, and adjustable means with which the cans are adapted to engage during the rotation of the cheeks and drum.

9. In a can-handling machine the combination of a revolving support or drum, upper and lower cheeks carried thereon said cheeks and drum revolvable independently but in the same direction, a bell-crank lever fulcrumed in relation to the spindle of each of said lower cheeks, said lever having a longer segmental arm adapted to engage a cam whereby the said lower cheek is raised to hold securely a can interposed between said lower cheek and its respective upper cheek, pivoted arms carrying cam-rollers, a cam-roller in connection with each of said arms, a projection on the drum and a roller on the projection adapted to engage said cam-roller whereby the cammer is drawn and held against the passing can and means by which the bell-crank lever may be tripped to separate the cheeks and release the can.

10. In a can-handling machine the combination of a traveling support, sets of rotatable cheeks thereon, a movable arm carrying a cam-roller, a cam on said arm and means for engaging said cam to bring said roller into engagement with the revolving can.

11. In a can-handling machine the combination of a traveling support, sets of rotatable cheeks thereon, a movable member carrying a cam-roller, a cam-roller on said member and a movable arm engaging said cam to draw said roller into and hold it in engagement with the revolving can.

12. The combination with a continuously-revolving can-carrier, drum or support, of a plurality of sets of rotating can-checks thereon, a plurality of swinging arms or levers each furnished with a camming-roller, and interengaging cams and projections for automatically and positively holding and pressing the camming-rollers against the camming-flanges of the cans as the cans are rotated and carried continuously along in the rotating cheeks on the traveling carrier, substantially as specified.

13. The combination with a continuously-moving can carrier or support, of a plurality of sets of rotating can-checks thereon, a plurality of camming-rollers, a plurality of swinging arms mounted on the stationary frame of the machine and carrying said camming-rollers, and interengaging devices on said swinging arms and carrier for forcing and holding the camming-rollers against the rotating cans as they pass, substantially as specified.

14. The combination with a plurality of continuously-traveling rotating sets of can-checks, of a plurality of camming-rollers engaging the rotating cans successively as they pass in their traveling cheeks, and mechanism for positively forcing and holding the camming-rollers against the traveling and rotating cans as they pass, substantially as specified.

15. The combination with a plurality of camming-rollers engaging the rotating cans successively as they pass in their traveling cheeks, and mechanism for positively forcing and holding the camming-rollers against the traveling and rotating cans as they pass, said mechanism comprising interengaging cams and projections, substantially as specified.

16. The combination with a continuously-moving can-carrier having a plurality of sets of rotating can-checks thereon, of a plurality of camming-rollers, and a plurality of interengaging cams and projections for positively forcing and holding the camming-rollers against the rotating cans as they travel past the camming-rollers, substantially as specified.

17. The combination with a continuously-moving can-carrier having a plurality of rotating can-checks thereon, of a camming-roller mounted on a movable device independent of said carrier, and an interengaging cam and projection for forcing and holding the camming-roller against the can as it passes in the traveling and rotating can-check, substantially as specified.

18. The combination with a traveling support or carrier, of a plurality of sets of rotating can-checks thereon, a swinging arm mounted on the stationary frame of the machine and provided with a camming-roller, and interengaging cam and projection members for positively holding the camming-roller against the rotating can as it passes, one of said members being on said swinging arm and the other on said traveling support or carrier, substantially as specified.

19. The combination with a traveling support or carrier, of a plurality of sets of rotating can-checks thereon, a swinging arm mounted on the stationary frame of the machine and provided with a camming-roller, and a cam and projection for positively holding the camming-roller against

the stationary can as it passes, said cam being on the swinging arm and said projection on the stationary frame, substantially as specified.

20. The combination with a traveling support or carrier having a plurality of sets of rotating can-checks thereon, a plurality of swinging arms mounted on the stationary frame of the machine, a cam and a camming-roller on each of said arms, and a plurality of projections on the carrier engaging said cam on said arms to press and hold the camming-rollers against the cans as they pass, substantially as specified.

21. The combination with a traveling support or carrier having a plurality of sets of rotating can-checks thereon, a plurality of swinging arms mounted on the stationary frame of the machine, a cam and a camming-roller on each of said arms, a plurality of projections on the carrier engaging said cam on said arms to press and hold the camming-rollers against the cans as they pass, and a spring for each of said swinging arms, substantially as specified.

701,590. GAS AND AIR MIXER. GEORGE A. LOHMEYER, Phila. Pa. Filed May 12, 1901. Serial No. 60,380. (No model.)

Claim.—1. A gas and air mixing apparatus in which are combined a casing having valved inlet for external air and closed against outflow thereto and containing a gas-chamber and an air-chamber, valve mechanism governing the flow of gas into and from said gas-chamber, a movable diaphragm acted upon by the gas in the gas-chamber, and means whereby the movement of said diaphragm is caused to effect compression of air in the air-chamber for admixture with the gas, substantially as specified.

2. A gas and air mixing apparatus in which are combined a casing having valved inlet for external air and closed against outflow thereto and containing a pair of gas-chambers and a pair of air-chambers, valve mechanism governing the flow of gas into and from said gas-chambers, one or more movable diaphragms acted upon by the gas in the gas-chambers and caused to move by the difference in pressure of the gas in said chambers, and means whereby the diaphragm movement is caused to effect inflow of air into one air-chamber simultaneously with the expulsion of air under pressure from the other air-chamber for admixture with the gas, substantially as specified.

3. A gas and air mixing apparatus in which are combined a casing having valved inlet for external air and closed against outflow thereto and containing a gas-chamber and an air-chamber, valve mechanism governing the flow of gas into and from said gas-chamber, a movable diaphragm separating said gas and air chambers, and means whereby the flow of gas into and from the gas-chamber is caused to effect movement of the diaphragm separating the gas and air chamber and thereby compress air in the air-chamber for admixture with the gas, substantially as specified.

4. A gas and air mixing apparatus in which are combined a casing having valved inlet for external air and closed against outflow thereto and containing a gas-chamber and an air-chamber, valve mechanism governing the flow of gas into and from said gas-chamber, a movable diaphragm acted upon by the gas in the gas-chamber, means whereby the movement of said diaphragm is caused to effect compression of air in the air-chamber for admixture with the gas, and valve-operating mechanism actuated by the movable diaphragm, substantially as specified.

5. A gas and air mixing apparatus in which are combined a casing having valved inlet for external air and closed against outflow thereto and containing a pair of gas-chambers, and a pair of air-chambers, valve mechanism governing the flow of gas into and from said gas-chambers, one or more movable diaphragms acted upon by the gas in the gas-chambers and caused to move by reason of the difference in pressure in said gas-chambers, means whereby the diaphragm movement is caused to effect inflow of air into one air-chamber simultaneously with the expulsion of air under pressure from the other chamber for admixture with the gas

and valve operating mechanism actuated by connection with the movable diaphragm structure of the apparatus, substantially as specified.

6. A gas and air mixing apparatus in which are combined a casing having valved inlet for external air and closed against outflow thereto and containing gas and air chambers, valve mechanism governing the flow of gas into and from said gas-chamber, a movable diaphragm separating said gas and air chambers, and means whereby the flow of gas into and from the gas-chamber effects movement of the diaphragm separating the gas and air chamber, means whereby such movement of the diaphragm is caused to compress air in the air-chamber for admixture with the gas, and valve-operating device actuated by connection with the movable diaphragm, substantially as specified.

7. A gas and air mixing apparatus in which are combined a casing having two gas-chambers and two air-chambers, movable diaphragms separating said gas and air chambers, and having connection with each other inside of the casing, valve mechanism whereby the gas is admitted to and exhausted from the gas-chambers alternately, and the diaphragms are caused to move by reason of the difference in pressure in the two gas-chambers, and means whereby the movement of the diaphragms is caused to effect inflow of air into one air-chamber simultaneously with the expulsion of air from the other air-chamber for admixture with the gas, substantially as specified.

8. A gas and air mixing apparatus in which are combined a casing having two gas-chambers and two air-chambers, movable diaphragms separating said gas and air chambers, and having connection with each other inside of the casing, valve mechanism whereby the gas is admitted to and exhausted from the gas-chambers alternately so as to cause movement of the diaphragms by reason of the difference in pressure in the two gas-chambers, means whereby the movement of the diaphragms is caused to draw air into one air-chamber simultaneously with the expulsion of air under pressure from the other air-chamber for admixture with the gas, and valve-operating device actuated by connection with the movable diaphragm structure of the apparatus, substantially as specified.

9. A gas and air mixing apparatus in which are combined a casing having a pair of gas-chambers separated by a movable diaphragm, a pair of air-chambers separated from said gas-chambers by movable diaphragms of greater area than that which separates the gas-chambers, valve mechanism for controlling the flow of gas into and its discharge from each gas-chamber, and means whereby the movement of the diaphragms is caused to effect compression of air in the air-chambers alternately for admixture with the gas, substantially as specified.

10. The combination in a gas and air mixing apparatus, of a casing having a pair of gas-chambers separated by a movable diaphragm, a pair of air-chambers separated from said gas-chambers by movable diaphragms of greater area than that which separates the gas-chambers, valve mechanism for controlling the flow of gas into and its discharge from each gas-chamber, means whereby the movement of the diaphragms is caused to effect compression of air in the air-chambers alternately for admixture with the gas, and valve-operating mechanism actuated by connection with the movable diaphragm structure of the apparatus, substantially as specified.

11. A gas and air mixing apparatus in which are combined a casing having a gas-chamber, an air-chamber containing a bellows, valve mechanism governing the flow of air and gas into and from said gas-chamber, a diaphragm acted upon by the gas in said gas-chamber, and means whereby the movement of said diaphragm is caused to effect movement of the bellows in the air-chamber and thereby alternately draw air into and expel it under pressure from said air-chamber and bellows for admixture with the gas, substantially as specified.

12. A gas and air mixing apparatus in which are combined a casing having a gas-chamber and an air-chamber containing a bellows, valve mechanism governing the flow of gas into and from said gas-chamber, a movable diaphragm acted upon by the gas in the gas-chamber, valve-operating mechanism actuated by connection with said diaphragm, and means whereby the movement of the diaphragm is caused to operate the bellows in the air-chamber and thereby alternately draw air into and expel it under pressure from the air-chamber and bellows, substantially as specified.

13. A gas and air mixing apparatus in which are combined a casing having a gas-chamber and an air-chamber containing a bellows, a movable diaphragm separating said gas and air chambers, valve mechanism governing the flow of gas into and from the gas-chamber, and means whereby the movement of the diaphragm under the varying pressure in the gas-chamber is caused to effect the operation of the bellows in the air-chamber and thereby alternately draw air into and expel it under pressure from the air-chamber and the bellows for admixture with the gas, substantially as specified.

14. A gas and air mixing apparatus in which are combined a casing having a gas-chamber and an air-chamber containing a bellows, valve mechanism governing the flow of gas into and from said gas-chamber, a movable diaphragm separating the gas and air chambers and deriving its

movement from the gas in the gas-chamber, and means whereby said movement of the diaphragm is caused to effect the operation of the bellows in the air-chamber so as to alternately draw air into and expel it under pressure from said air-chamber and bellows, and valve-operating mechanism actuated by connection with the movable diaphragm, substantially as specified.

15. A gas and air mixing apparatus in which are combined a casing having a pair of gas-chambers and a pair of air-chambers each containing a bellows, valve mechanism whereby the flow of gas into and from the gas-chambers is governed so as to cause one chamber to fill with gas as the other is being discharged, one or more movable diaphragms actuated by reason of the difference of pressure of the gas in the two gas-chambers, and means whereby the diaphragm movement is caused to operate the bellows in the air-chambers so as to alternately draw air into and expel it from said air-chambers and bellows, substantially as specified.

16. A gas and air mixing apparatus in which are combined a casing having a pair of gas-chambers and a pair of air-chambers each containing a bellows, valve mechanism for governing the flow of gas into and from the gas-chambers so that one chamber fills with gas as the other is being discharged, one or more movable diaphragms whose movement is caused by difference of pressure of the gas in the two gas-chambers, means whereby the bellows in the air-chambers are operated by the diaphragm movement so as to alternately draw air into and expel it under pressure from said bellows and air-chambers, and valve-operating mechanism actuated by connection with the movable diaphragm structure of the apparatus, substantially as specified.

17. A gas and air mixing apparatus in which are combined a casing having a pair of gas-chambers, and a pair of air-chambers each air-chamber containing a bellows, valve mechanism governing the flow of gas into and its discharge from each gas-chamber, movable diaphragms separating the gas-chambers from the air-chambers, and means whereby the movement of the diaphragms by reason of the difference of pressure of the gas in the two gas-chambers is caused to operate the bellows in the air-chambers and thereby alternately draw air into and expel it under pressure from said bellows and air-chambers, substantially as specified.

18. A gas and air mixing apparatus in which are combined a casing having a pair of gas-chambers and a pair of air-chambers, each of said chambers containing a bellows, valve mechanism controlling the flow of gas into and its discharge from each of said gas-chambers, movable diaphragms separating the gas-chambers from the air-chambers, means whereby the movement of said diaphragms under the influence of difference of pressure of the gas in the two gas-chambers is caused to operate the bellows in the air-chambers and alternately draw air into and expel it under pressure from said bellows and air-chambers, and valve-operating mechanism actuated by connection with the diaphragm structure of the apparatus, substantially as specified.

701,591. GUNPOWDER. EARL G. LOHMEYER, Worcester, Mass. Filed Feb. 20, 1902. Serial No. 56,176. (No model.)

Claim.—1. A gunpowder in which nitroglycerin, nitrocellulose and diethyl phthalate are combined, substantially as herein described.

2. A gunpowder consisting of nitroglycerin, nitrocellulose, mineral jelly and diethyl phthalate, substantially as herein described.

701,592. LOADING ATTACHMENT FOR HAND-TRUCK. THOMAS J. LYNN, Chicago, Ill. Filed Mar. 20, 1901. Serial No. 54,082. (No model.)

Claim.—1. The combination with a hand-truck, of a slotted device connected therewith and movable endwise thereon, said device being constructed to shift longitudinally of the truck during the loading of a box or the like thereon.

2. The combination with a hand-truck, provided at the lower end

thereof with means for preventing a box slipping thereon, of a clutch device connected therewith and movable endwise thereon, said clutch device being constructed to shift longitudinally on the track during the loading of a box or the like thereon.

3. The combination with a hand-truck, of a longitudinal guide-rail thereon, a clutch device having interlocking connection with and sliding endwise on said rail, said clutch device being constructed to shift on said rail during the loading of a box or the like on the truck.

4. The combination with a hand-truck, provided at the lower end thereof with a series of teeth or corrugations, of a central longitudinal guide-rail thereon, a clutch device having interlocking connection with and sliding endwise on said rail, said clutch device being constructed to shift on said rail during the loading of a box or the like on the truck.

5. The combination with a hand-truck having a guide or way thereon, a member freely slidable thereon, and a clutch device comprising a lower member pivoted to the sliding member and an upper member pivoted to the lower member, said lower and upper members being constructed to first grasp a load, and then shift their grasp to the center of gravity of the load changes in being lifted by the truck.

6. The combination with a hand-truck provided at its lower end with means preventing the box slipping thereon, of a guide-rail attached to the front thereof, a clutch device embracing a plate having interlocking and endwise-movable connection with the rail, a lower clutch member pivoted at its upper end to said plate and provided with laterally-separated prongs and an upper clutch member provided with a central prong and pivoted to the lower clutch member between the pivot of the latter and its prongs, said clutch constructed to shift their hold on a load during the transfer of the center of gravity of the load from its resting-place to the truck, substantially as described.

7. The combination with a hand-truck, of a clutch device comprising upper and lower clutch members adapted to grasp a box above and below the upper corner thereof, and a handle on the upper clutch member having a part adapted to engage with the truck to afford means by which said device is suspended at the upper end of the truck.

8. The combination with a hand-truck, of a clutch device comprising upper and lower clutch members adapted to grasp a box above and below the upper corner thereof, and a handle on the upper clutch member comprising a lateral member which has swiveling or relative connection with said upper clutch member whereby it may be turned to overhang a part of the truck and said clutch to thereby be suspended on the truck.

701,593. EXCAVATING AND LOADING MACHINE. DANIEL H. HARRIS, Vincennes, Ind. Filed Sept. 5, 1901. Serial No. 74,266. (No model.)

Claim.—1. An excavating and loading machine comprising a support, a boom, a scoop carried by the boom, means for raising and lowering the boom, and an inclined guide, separate from said means, for the movement of the boom.

2. An excavating and loading machine consisting of a carrier adapted

to be drawn over a movable support, and means on the carrier for excavating at the side of the movable support and for loading the excavated material on the movable support, said means being propelled by the movement of the latter during the excavating operation.

3. An excavating and loading machine consisting of a carrier adapted to be supported on and to be drawn over a train of movable cars, a boom on the carrier, means for raising and lowering the boom in an inclined plane and a scoop carried by the boom.

4. An excavating and loading machine consisting of a carrier provided with runners, means for drawing the carrier along a train of movable cars, a scoop supported from the carrier to excavate by the movement of the train, and means for elevating the scoop to discharge on the cars.

5. In a machine of the class described, the combination of a support, a boom swiveled at one end thereof, a scoop carried by the boom, means for raising and lowering the boom, and an adjustable inclined guide for the movement of the boom.

6. In a machine of the class described, the combination of a support, a boom swiveled thereon, means for raising and lowering the boom, an adjustable inclined guide for the boom, and a scoop adjustably attached to the boom.

7. In a machine of the class described, the combination of a support, a boom swiveled thereon, means for raising and lowering the boom, an adjustable inclined guide for the boom, a block adjustably secured to the boom, and a scoop having a ball pivotally secured to said block.

8. In a machine of the class described, the combination of a support, a boom swiveled thereon, means for raising and lowering the boom, a guide for the boom, a scoop pivoted on the boom, and an adjustable arm on the boom engaging an adjustable stop on the scoop to prevent tilting of the latter during excavating.

9. In a machine of the class described, the combination of a support, a boom swiveled thereon, means for raising and lowering the boom, a guide for the boom, a scoop pivoted in its open end to the boom, an adjustable arm on the boom engaging an adjustable stop on the scoop to prevent tilting of the latter during excavating, and a cord attached to the closed end of the scoop and adapted to right the latter at the end of its downward movement.

10. In a machine of the class described the combination of a support, a boom swiveled thereon, means for raising and lowering the boom, a scoop carried by the boom, an inclined guide for the movement of the boom, an extension adjustably secured to the guide, and a brace for the extension.

11. In a machine of the class described, the combination of a support, a boom swiveled thereon, means for raising and lowering the boom, a scoop carried by the boom, an inclined guide for the movement of the boom, and a roller on the boom contacting with the guide.

12. In a machine of the class described, the combination of a carrier adapted to be drawn along a movable support, a boom swiveled at one end thereof, a scoop carried by the boom, means for raising and lowering the boom, an inclined guide for the movement of the boom, and clamps for temporarily securing the carrier to the support.

13. In a machine of the class described, the combination of a carrier, an upright on the carrier, a scoop, a boom operatively connected with the scoop, and a shiftable support on the upright for the boom whereby the scoop may be used at either side of the carrier.

701,594. CAR-COUPPLING. HENRY E. MARSHALL, Lincoln, Neb. Filed Nov. 15, 1901. Serial No. 68,711. (No model.)

Claim.—1. The combination of a draft-frame provided with end couplers, a draw-head having a shank or draw-bar extending between the sides of the draft-frame and connected with the latter, longitudinal draft-bars connected directly to the draw-head at opposite sides of the shank or draw-bar, and cushioning-springs located at opposite sides of the shank or draw-bar and arranged in the said couplers and interposed between the draft-frame and the draw-head, substantially as described.

2. The combination of a draft-frame, a draw-head having a shank or bar and provided at opposite sides of the same with recesses located at the back of the draw-head, draft-rods provided with slots or openings arranged in the recesses of the draw-head, lugs mounted on the draw-head and passing through the slots or openings of the draft-rods, and cushioning-springs interposed between the back of the draw-head and the draft-frame, substantially as described.

3. The combination of an attachment-frame provided at opposite sides with longitudinally-located openings, draft-rods loosely arranged in the longitudinally-located openings, a draw-head having a shank arranged between the sides of the draft-frame, the back of the draw-head being connected to the draft-rods, and coiled springs disposed on the draft-rods and interposed between the attachment-frame and the draw-head, substantially as described.

4. The combination of an attachment-frame having end couplers and provided with longitudinal openings, draft-rods extending through the openings of the draft-frame and provided at their ends with slots, a draw-head provided at opposite sides with couplers receiving the ends of the draft-rods, lugs mounted on the draw-head and passing through the slots of the rods, and springs arranged on the rods and seated in the couplers of the draft-frame and engaging the back of the draw-head, substantially as described.

701,595. FEATHERING PADDLE-WHEEL. JAMES HENRY WELLS, Wadsworth, Ohio. Filed June 15, 1901. Serial No. 64,662. (No model.)

Claim.—1. A feathering paddle-wheel, comprising a shaft, a paddle-wheel support or body portion mounted thereon and provided with a series of openings or recesses in its face, a series of radially-extending axially-rotating paddle-shafts mounted in suitable bearings attached to the said paddle-wheel support or body portion, a series of friction-wheels mounted on the shafts and having their peripheries extending through the said openings, and a suitably-supported friction-plate mounted adjacent to the side of the said paddle-wheel support or body portion whereby the said friction-wheels are brought into engagement therewith to rotate the said paddle-shafts, substantially as described.

2. A paddle-wheel, consisting of the main body portion thereof mounted on a shaft and provided with a series of openings or recesses in its face and carrying a series of radial axially-rotating paddle-shafts provided with friction-wheels the peripheries of which extend through the said openings or recesses and which are adapted to come into contact with and ride upon a friction-plate suitably mounted adjacent to the said paddle-wheel whereby the said paddle-shafts are rotated, paddle-shafts mounted on the said paddle-shafts, and means attached to the paddles whereby the same are held in line with the periphery of the wheel during a portion of its revolution.

3. A feathering paddle-wheel, comprising a wheel-support or body portion mounted on a shaft and provided with a series of openings in its face, a series of radially-extending axially-rotating paddle-shafts mounted in suitable bearings attached to the said wheel-support or body portion, a series of friction-wheels mounted on the said paddle-shafts and extending through the said openings, a friction-plate suitably mounted beneath the paddle-wheel shaft and parallel with and adjacent to the side of the paddle-wheel body whereby the said friction-wheels come into engagement therewith to rotate the said paddle-shafts during a portion of the revolution of the paddle-wheel, and means connected to the paddles whereby the same are kept in line with the periphery of the wheel during that portion of the revolution of the paddle-wheel when the said paddle-shafts are not being rotated by the engagement of the friction-wheels with the friction-plate.

4. In a feathering paddle-wheel, a feathering-paddle attached to the end of a shaft and provided near its ends with feathers or wings pivotally attached to the sides thereof and which when moved in one direction will lie flat to the side of the paddle but when moved in the opposite direction are brought into contact with stops which hold the wings outwardly at an angle to the side of the paddle, substantially as described.

5. In a paddle-wheel, the combination with a driving-shaft, of a wheel connected thereto, radial axially-rotating paddle-shafts carried by the wheel, friction-wheels mounted on the said paddle-shafts and extending through openings or recesses in the body of the wheel, a friction-plate suitably mounted adjacent to and parallel with the side of the said wheel whereby the said friction-wheels are rotated during the lower half

of the revolution of the paddle-wheel, means connected to the said friction-plate whereby the same is held in position and rendered oscillative, and means connected to the paddles whereby the same are held in line with the periphery of the paddle-wheel during the upper half of its revolution, substantially as described and for the purpose set forth.

6. In a feathering paddle-wheel, the combination with an axially-rotating paddle-shaft provided with a friction-wheel adapted to come into contact with a friction-plate whereby the same is rotated during a portion of the revolution of the paddle-wheel; of a paddle attached to the end of the shaft and provided at or near its ends with feathers or wings pivotally attached thereto and which when moved in one direction will lie flat to the side of the paddle but when moved in the opposite direction are brought into contact with stops which hold the wings outwardly at an angle to the side of the paddle whereby the same is held in line with the periphery of the paddle-wheel when the said friction-wheel is not being operated upon by means for rotating the same.

7. In a feathering paddle-wheel, a radial axially-rotating paddle-shaft mounted in suitable bearings attached to the main body portion thereof and provided with a friction-wheel adapted to come into engagement with a friction-plate whereby the said shaft is rotated during a portion of the revolution of the paddle-wheel, and a feathering-paddle attached to its end and provided with means for holding the paddle in line with the periphery of the paddle-wheel when the said friction-wheel is not in engagement with the said friction-plate.

8. In a feathering paddle-wheel, a friction-plate suitably mounted beneath the paddle-wheel shaft and adjacent to the side of the main body portion thereof, means connected to the said friction-plate whereby the same is held in position and the friction-wheels rotated during a portion of the revolution of the paddle-wheel; and means for rendering the said friction-plate oscillative.

9. In a paddle-wheel, the combination with the main body portion thereof mounted on a shaft, and provided with a series of openings or recesses in its face; of a series of radial axially-rotating paddle-shafts mounted thereon and provided with friction-wheels the peripheries of which extend through the said openings or recesses, and a friction-plate mounted adjacent to the paddle-wheel body whereby the said friction-wheels are adapted to come into contact therewith for rotating said paddle-shafts during a portion of the revolution of the paddle-wheel.

10. In a paddle-wheel, the combination with the main body portion thereof mounted on a shaft and provided with a series of openings or recesses in its face and carrying a series of radial axially-rotating paddle-shafts provided with friction-wheels the peripheries of which extend through the said openings or recesses; of a friction-plate suitably mounted adjacent to the side of the paddle-wheel body whereby the said friction-wheels come into engagement therewith to rotate the said paddle-shafts during a portion of the revolution of the paddle-wheel, and means attached to the paddles for holding the same in line with the periphery of the paddle-wheel when the said friction-wheels are not in engagement with the friction-plate.

11. A paddle-wheel, consisting of a main body portion mounted on a shaft and provided with a series of openings in its face, a series of radially-extending axially-rotating paddle-shafts carried by the main body portion, a series of friction-wheels mounted on said paddle-shafts and extending through the said openings, a friction-plate suitably mounted adjacent to the side of the main body portion of the wheel whereby the said friction-wheels come into engagement therewith to rotate the said paddle-shafts during a portion of the revolution of the paddle-wheel, and means connected to the paddles whereby the same are kept in line with the periphery of the wheel during that portion of the revolution of the paddle-wheel when the said paddle-shafts are not being rotated by the engagement of the friction-wheels with the friction-plate.

12. In a paddle-wheel, a main body portion mounted on a shaft, a series of radial axially-rotating paddle-shafts mounted on the said main body portion and provided with friction-wheels adapted to come into contact with and ride upon a friction-plate whereby the said shafts are rotated, a friction-plate mounted adjacent to the said main body portion thereof, means connected to the said friction-plate whereby the same is held in position to engage the said friction-wheels, and feathering-paddles attached to the said paddle-shafts and provided with means whereby the same are held in line with the periphery of the paddle-wheel when the said friction-wheels are not in engagement with the friction-plate.

13. In a feathering paddle-wheel, the combination with a rotating paddle-shaft provided with a friction-wheel adapted to come into engagement with a friction-plate whereby said shaft is rotated during a portion of the revolution of the paddle-wheel; of a paddle mounted on the said paddle-shaft and provided with means whereby the same is held in a line with the periphery of the paddle-wheel when the said friction-wheel is not in engagement with the friction-plate.

14. A paddle-wheel, consisting of a main body portion mounted on a shaft, a series of radially-extending axially-rotating paddle-shafts car-

ried by the said main body portion, a series of friction-wheels mounted on said paddle-shafts and adapted to come into contact with and ride upon a friction-plate whereby the said paddle-shafts are rotated during a portion of the revolution of the paddle-wheel, a friction-plate mounted adjacent to the main body portion of the paddle-wheel, means connected to the friction-plate whereby the same is held in position and rendered operative, paddles mounted on the said paddle-shafts, and means connected thereto whereby the same are held in line with the periphery of the wheel when the friction-wheels are not in engagement with the friction-plate.

15. In a paddle-wheel, the combination with the main body portion thereof mounted on a shaft; of a series of radial axially-rotating paddle-shafts provided with friction-wheels adapted to come into engagement with a friction-plate whereby the said paddle-shafts are rotated during a portion of the revolution of the paddle-wheel, and a series of paddles attached to the said paddle-shafts and provided with means whereby the same are held in line with the periphery of the wheel when the friction-wheels are not in contact with the friction-plate.

16. In a paddle-wheel, the combination, with the main body portion thereof mounted on a shaft; of a series of paddle-shafts mounted thereon, paddles attached to the said paddle-shafts, and means attached to said paddles whereby the same are held in line with the periphery of the paddle-wheel during a portion of its revolution.

17. The combination, in a paddle-wheel, with a series of paddle-shafts carried by the main body portion thereof; of a series of friction-wheels mounted thereon for revolving the same during a portion of the revolution of the paddle-wheel, a series of paddles attached to the paddle-shafts, and means attached to the paddles whereby the same are held in line with the periphery of the paddle-wheel during the upper portion of its revolution.

18. A paddle-wheel, consisting of the main body portion thereof mounted on a shaft and carrying a series of radial axially-rotating paddle-shafts provided with friction-wheels adapted to come into engagement with and ride upon a friction-plate suitably mounted adjacent to the said main body portion whereby the said paddle-shafts are rotated during the lower portion of its revolution, paddles attached to the paddle-shafts, and means attached to the paddles whereby the same are kept in line with the periphery of the paddle-wheel during the upper portion of its revolution.

19. In a feathering paddle-wheel, the combination with an axially-rotating paddle-shaft provided at its end with a paddle; of mechanism attached to the said paddle whereby the same is held in line with the periphery of the paddle-wheel when the said paddle-shaft is not being operated upon by means for rotating the same.

20. In a feathering paddle-wheel, a series of feathers or wings pivotally attached to a paddle whereby the same is held in line with the periphery of the paddle-wheel when the paddle-shaft is not being operated upon by means for rotating the same.

701,596. TELEPHONE CALL-LINE. MORRIS HENRIKSEN, New York, N. Y. Filed Nov. 14, 1901. Serial No. 24,565. (No model.)

Claim.—A telephone call-line, consisting of a back having a suspension device attached to its upper end, and a cover hinged to the lower end of said back and covering the lower half of the same, a plurality of sheets of uniformly-increasing length from the front to the back sheet between said cover and back, said sheets being evenly disposed at their lower edges and having extending portions provided at the upper edges of said sheets which project successively each beyond the preceding one, in step arrangement from the upper edge of the cover, covering provided on said sheets at an equal distance from the upper edges thereof, and means for securing the sheets together adjacent said covering, and a spring closing means for said cover, substantially as shown.

701,597. DOOR-HANGER. FRED C. HENRIK, Washington, W. Va. Assignor of one-fourth to J. W. E. Henrich, Washington, W. Va. Filed May 14, 1901. Serial No. 21,770. (No model.)

Claim.—1. A door-hanger comprising sections, one of which is adapted to be secured to a door, the other being arranged to movably engage a supporting-track, each of said sections being further provided with a detent, and a device connecting the sections and movably engaging in the detent thereof.

2. A door-hanger comprising sections one of which is adapted to be secured to a door, the other being arranged to movably engage a supporting-track, each of said sections being provided with transversely-disposed detents, portions of said detents being located in alignment, and a roller rotatably mounted in the aligned portions of said detents and being movable therein.

3. A door-hanger comprising sections, one of which is adapted to be secured to a door, the other being arranged to movably engage a supporting-track, each of said sections being provided with a horizontal transversely-disposed detent arranged in overlapping relation, and a roller engaging in said detents and movable therein.

4. The combination with a door, of a track located above the door, and a hanger connecting the door and track, said hanger comprising two sections, one of which is composed of an upright stirrup having shoulders that engage over the edges of the track, a runner-wheel carried by the stirrup and bearing upon the track, said stirrup being further provided with a depending foot having a horizontal detent disposed transversely of the track, the other section being secured to the door and having spaced jaws which embrace the foot of the first-mentioned section, said jaws being provided with detents disposed transversely to the door, and a roller connecting the sections and passing through the several detents thereof.

701,598. ACETYLENE-GAS GENERATOR. JOHN A. HENRIK, Chicago, Ill. Assignor to the Adams and Westlake Company, a Corporation of Illinois. Filed Jan. 2, 1901. Serial No. 41,922. (No model.)

Claim.—1. In an acetylene-generator, in combination, water-supply and gas-distributing pipes, a nipple common to and having a valve

for controlling both sets of pipes, a generating-cell adapted to engage each nipple, and a vent-pipe leading from each nipple below its valve and opening to the water-pipe.

2. In an acetylene-generator, in combination, a water-reservoir, a water-delivery pipe leading therefrom, a gas-conveying pipe, a nipple common to the water and gas pipes and having a valve for controlling both, a generating-cell adapted for attachment to the nipple, and a vent-pipe in loop form leading from the nipple below its valve to the water-pipe and extending above the reservoir.

701,599. COPY-HOLDER. JOHN E. McKEITH, Poplar, Kans. Filed Feb. 12, 1901. Serial No. 44,982. (No model.)

Claim.—1. A copy holder or case, comprising a folder folded longitudinally into four separate leaves or parts which are integrally connected, two of said leaves or parts being connected at one edge to form a copy-receptacle, and means whereby the receptacle is held in an inclined position by the other two parts of the folder to serve as a display-surface, substantially as shown and described.

2. A copy holder or case comprising a sheet folded longitudinally into four separate parts or leaves which are flexibly connected and two of which are connected to form a copy-receptacle, and means whereby the receptacle is held in an inclined position by the other two parts of the folder, so as to serve as a display-surface, and a plurality of copies secured in one end of said receptacle by a pivot-pin, substantially as shown and described.

3. A copy-holder consisting of a four-leaf folder, two adjacent leaves or parts of which are united to form a receptacle open at one side and at both ends, and means for holding one side of said receptacle in an inclined position by the other two parts of the folder, and a plurality of copies secured by a pivot-pin in one end of said receptacle, one of the side walls of said receptacle being also provided with a spring-clip.

4. A copy holder or case, comprising a four-leaf folder two leaves of which are united at one edge to form a receptacle open at the ends and at one side, said leaves being connected at one end by a rivet or cyclet, a plurality of copies within said receptacle and held therein by said rivet or cyclet, said copies being adapted to be turned outwardly through the open side of said receptacle, substantially as shown and described.

5. A copy holder or case, comprising a folder two leaves of which are connected at one edge to form a receptacle open at both ends and at one side, said folder being also provided with a male and a supplemental flap the supplemental flap being provided with a transverse detent in one edge thereof, a disk secured at the inner end of said detent, a double cord passed through the closed side of said receptacle and through the fold of the flap at the open side thereof, and a spring-clip secured to the back of said receptacle adjacent to the open side thereof, substantially as shown and described.

6. A copy holder or case comprising a folder two leaves of which are connected at one edge to form a receptacle open at both ends and at one side, said folder being also provided with a male and a supplemental flap the supplemental flap being provided with a transverse detent in one edge thereof, a disk secured at the inner end of said detent, a double cord passed through the closed side of said receptacle and through the fold of the flap at the open side thereof, and a spring-clip secured to the back of said receptacle adjacent to the open side thereof, said receptacle being also provided with a plurality of copies secured by a pivot at one end thereof, and adapted to be turned outwardly through the open side thereof, substantially as shown and described.

701,600. SAND-BOX. JOHN D. McKEITH, St. Louis, Mo. Filed Oct. 9, 1901. Serial No. 75,157. (No model.)

Claim.—The combination of a pair of horizontal flat blades, each clamping substantially at a right angle to a supporting-standard, said standards attached to a handle, and a second pair of standards attached to the same handle substantially at a right angle to the first pair of standards,

and each standard supporting a vertical blade at a substantially right angle to it.

701,601. HAIR-CLIPPER. ROBERT E. McKEITH, Chicago, Ill. Filed Oct. 12, 1901. Serial No. 75,462. (No model.)

Claim.—1. In a device of the character described, a pair of integral substantially rectangular blades having their rear ends extended to form handles, said blades having their inner surfaces connected throughout and carrying a series of integral clipping-teeth on their forward ends, said blades being pivotally connected near their forward ends, the outer faces of the ends tapering to the cutting-teeth, substantially as described.

2. In hair-clippers, a pair of substantially rectangular integral blades the rear ends of which are extended to form integral handles and which have a series of cutting-teeth formed integral with the front ends thereof, and a pivotal connection between said blades slightly to the rear of said front ends whereby the blades and integral handles may have an opposite lateral movement with relation to one another and be disengaged when said blades are at a substantial right angle, substantially as described.

3. Hair-clippers which comprise in their entirety a pair of flat blades having integral flat handles carried by their rear ends, with clipping-teeth formed integral with their forward ends, a T-head rivet carried by one of said blades slightly to the rear of the teeth and engaging the outer face of the other of said blades, the last-named blade having an oblong detent formed therein lying transverse to said head of the rivet whereby said blades may have an opposite lateral movement with relation to one another and may be disengaged when the head registers with the detent, substantially as described.

701,602. MECHANICAL STOKER. AUGUST F. HADL, Munich, Germany, Assignor to Karl E. Gowing, Reading, Mass. Filed July 6, 1901. Serial No. 67,544. (No model.)

Claim.—1. A furnace fuel-feeder comprising in its construction a fuel-hopper, a screw conveyor for transporting the coal from the fuel-hopper to the furnace, means for discharging a smaller carrying capacity at the bottom of the hopper than in the passage leading from the hopper to the furnace, said means consisting of raising the diameter or pitch of the screw in the part which lies in the hopper, as compared with the part within the conveyor-tube.

2. A furnace fuel-feeder comprising in its construction a fuel-hopper, a screw conveyor for transporting the coal from the fuel-hopper to the furnace, in combination with a conveyor-tube having a contracted opening or throat at the inlet of the hopper, said conveyor screw being of less diameter in the hopper than in the passage leading from the hopper to the furnace.

3. A furnace fuel-feeder comprising in its construction a fuel-hopper, a screw conveyor for transporting the coal from the fuel-hopper to the furnace, and an obliquely-cut stirring device fixed on the conveyor-shaft at the end of the screw which lies in the hopper.

4. In a mechanical stoker, a coal-hopper located below the line of the boiler-room floor at or near the front of the furnace, an upwardly-inclined bottom plate at the rear portion of the furnace for the support of the coal during combustion, means for transferring the coal from the hopper to said rear portion of the furnace, an inclined ash-plate within the front end of the furnace for the deposit and removal of ashes, and means for supplying air beneath the coal to secure combustion.

5. In an under feed-stoker, a coal-hopper located below the line of the boiler-room floor at or near the front of the furnace, an upwardly-inclined conveyor-tube leading from the bottom of the hopper into the lower portion of the furnace, an upwardly-inclined trough extending backward from the end of the conveyor-tube to the rear part of the furnace and having an axle a continuation of the axle of the tube, an upwardly-inclined screw conveyor extending from the bottom of the hopper through the tube and trough to the rear end of the furnace, and means for driving said conveyor, in combination with rows of upwardly-inclined tuyeres placed at the side of the trough, a downwardly-inclined ash-plate located at the front end of the furnace and extending from the level of the fire-door downward to the front end of the trough, a number of ash-plates inclined upward and placed parallel with the trough and filling the openings between contiguous rows of tuyeres and between tuyeres and the walls of the furnace, and means for supplying the tuyeres with air under pressure, substantially as set forth.

6. In an under feed-stoker, a coal-hopper located below the line of the boiler-room floor at or near the front of the furnace, an upwardly-inclined conveyor-tube leading from the bottom of the hopper into the lower portion of the furnace and having a restricted opening, an upwardly-inclined trough extending backward from the end of the conveyor-tube to the rear part of the furnace, an upwardly-inclined screw conveyor extending from the bottom of the hopper through the tube and trough to the rear end of the furnace, the conveyor being of smaller diameter in that portion which lies in the hopper and extends through the restricted opening in the lower end of the tube than it is in the portion lying within the tube, and being of gradually reduced diameter from the front end of the trough to the rear end of the furnace, in combination with means for driving said conveyor, one or more rows of upwardly-inclined tuyeres placed at each side of the trough having air-openings into the furnace chamber several inches above the ash-plates to allow for the accumulation of ashes below the openings, a downwardly-inclined ash-plate located at the front end of the furnace extending from the level of the fire-door downward to the front end of the trough, a number of upwardly-inclined ash-plates

parallel to the trough and filling the openings between contiguous rows of tuyeres and between tuyeres and the walls of the furnace, and means for supplying the tuyeres with air under pressure, substantially as set forth.

701,608. VARIABLE MECHANISM FOR TRANSMITTING MOTION. JOHANNES KUNZE, Copenhagen, by MAGNUS, Denmark. Filed Aug. 22, 1891. Serial No. 73,985. (No model.)

Claim.—1. In a device for converting or transmitting motion, a driving crank-shaft, a rocking lever or balance having one end operatively connected with said crank-shaft, a block slidably guided by said balance, a driven shaft, a ratchet-drum carried by said driven shaft, a chain having one end connected to said drum and its intermediate portion connected to said block, and means connected with the other end of the chain for sliding the block toward the fulcrum of the lever, substantially as described.

2. In a device of the class described, a driving crank-shaft, a plurality of rocking levers or balances operatively connected thereto, sliding blocks guided on said balances, a driven shaft, ratchet-drums mounted on said shaft, intermediate portions of the fulcrums of said balances, chains secured to the drums and passing over said intermediate portions and having their intermediate portions connected with the blocks, and means for adjusting said chains, substantially as described.

3. In a device of the class described, a driving crank-shaft, a plurality of rocking levers or balances operatively connected thereto, sliding blocks guided on said balances, a driven shaft, ratchet-drums mounted on said shaft, chains secured to the drums and to the blocks and extending past the fulcrums of the levers, and automatically-operating means for drawing on or releasing said chains, substantially as described.

701,604. PROCESS OF MAKING CYANIDE. GEORGE OTTERHANS, Vienna, Austria-Hungary. Filed Feb. 12, 1891. Serial No. 67,086. (No specimens.)

Claim.—1. The process of producing cyanogen compounds from waste household substances and similar organic substances containing nitrogen, which consists in first subjecting said substances to destructive distillation, then bringing the resulting gases into contact with heated neutral material, then bringing said gases into contact with heated carbonaceous material, and finally bringing said gases into contact with heated nitrogen-absorbing material.

2. The process of producing cyanogen compounds from waste household substances and similar organic substances containing nitrogen, which consists in first subjecting said substances to destructive distillation, then bringing the resulting gases into contact with heated neutral material, then bringing said gases into contact with heated carbonaceous material, and finally bringing said gases into contact with a heated mixture of coal and carbonates of the alkalies.

701,604.

701,605. MANUFACTURE OF COLLOIDAL GOLD. CARL PAUL BRINGEN, Germany, assignor to Kalle and Company, Hildesheim, Germany, a firm. Filed Feb. 6, 1891. Serial No. 64,118. (No specimens.)

Claim.—1. The new process of preparing colloidal gold by adding to an aqueous solution of the alkali salts of the decomposition products of albumin (formed by the action of warm dilute alkalies on albumin) osmium tetroxide and as much alcohol of gold as slightly exceeds the quantity corresponding to the alkali present, heating this mixture until its coloration has changed into a bright red, dialyzing it against water, precipitating it with a dilute acid, dissolving the precipitate in dilute osmium tetroxide, dialyzing the solution again, and evaporating it.

2. As a new product the colloidal gold, containing over sixty per cent. pure metal, consisting of bright scales showing a brown lustre, being very easily and completely soluble in water and distinguished by its property to retain its solubility in dilute aqueous alkalies even after having been precipitated from its aqueous solutions by means of acids.

701,606. MANUFACTURE OF COLLOIDAL SILVER. CARL PAUL BRINGEN, Germany, assignor to Kalle and Company, Hildesheim, Germany, a firm. Filed Feb. 6, 1891. Serial No. 64,119. (No specimens.)

Claim.—1. The new process of preparing colloidal silver by adding to an aqueous solution of the alkali salts of the decomposition products of albumin (formed by the action of warm dilute alkalies on albumin) osmium tetroxide and as much alcohol of silver as slightly exceeds the quantity corresponding to the alkali present, heating and redissolving completely the so-formed precipitate, dialyzing the liquid against water, precipitating it with a dilute acid, dissolving the precipitate in dilute osmium tetroxide, dialyzing the solution again, and evaporating it.

2. As a new product the colloidal silver, containing up to ninety per cent. pure metal, consisting of bright scales showing a beautiful blue metallic lustre, being very easily and completely soluble in water and distinguished by its property to retain its solubility in dilute aqueous alkalies even after having been precipitated from its aqueous solutions by means of acids.

701,607. CHECK-VALVE FOR PUMP-CYLINDERS. JOHN W. PARK, Kankakee, Ind. Filed June 20, 1891. Serial No. 65,693. (No model.)

Claim.—The combination with a pump-cylinder, and a cap detachably connected to its lower end, of a plate seated in said cap and held in engagement with the cylinder thereby, said plate being provided with a

centrally-disposed opening around which is formed a concentric raised head the cross-sectional area of which is of inverted-V shape, whereby the inner face of said head is inclined toward the center of the opening and forms a valve-seat, and the outer face acts to brace the inner face and maintain the same inclined, a valve normally seated upon the inclined inner face of said head, a yielding packing-plate carried by said valve and having an inclined face coinciding and seating with the inclined inner face of the head, whereby said packing-plate exerts a wedging action upon the head to insure the positive seating of the valve, and a binding-plate also carried by said valve for holding the yielding packing-plate thereon.

701,608. ELECTRIC CONTROLLER. ANDREW FURMAN S. LEON, Pa., assignor, by direct and mesne assignments, to Pittsburgh Electric Machine Company, Pittsburgh, Pa., a Corporation of Pennsylvania. Filed Sept. 22, 1890. Serial No. 74,579. (No model.)

Claim.—1. A device of the class described, comprising a suitable box or case; a cover for said box composed of insulating material; terminals for the sweating-rods connected upon said cover; switches for the sweating-rods connected upon said cover; terminals for the lines leading from the generator mounted upon said cover; two inductance-lamp sockets mounted upon said cover; a rheostat for the sweating-rods connected to said cover; a line running from one of the generator-terminals through the rheostat to one of the switches; a second line connecting the switches together; a return-wire for the sweating-rods connected to the other generator-terminal; a line running from this return-wire through one of the lamps to the opposite terminal from that to which the return-wire is connected; binding-posts connected to said cover; electrodes connected to said binding-posts; a line connecting one of said binding-posts to the rheostat; a line running from the other binding-post through the second lamp to the opposite generator-terminal from that to which the rheostat is connected; a second rheostat; and a line running through said second rheostat and connected to the electrodes-wires at points on the opposite sides of said binding-posts from the electrodes as required to partly short-circuit the electrodes, substantially as specified.

2. In a device of the class described, a generator-circuit; a rheostat through which the generator-circuit passes; sweating-rods connected to the generator-circuit and connected to the generator-circuit; an electrode-circuit connected to the generator-circuit; a second rheostat connecting the electrode-circuit as required to partly short-circuit the electrodes; and a lamp incorporated into the electrode-circuit, substantially as specified.

3. In a device of the class described, a rheostat; a generator-circuit leading to the rheostat; an inductance lamp; a line passing through the inductance lamp, and short-circuiting the rheostat, substantially as specified.

4. In a device of the class described, a rheostat; a generator-circuit passing through the rheostat to the switches; a switch-circuit connected to said switches; electrodes connected to said generator-circuit as required to throw part of the circuit through the electrodes when they are connected; a lamp incorporated into the electrode-circuit; and a rheostat for partly short-circuiting the electrode-circuit, substantially as specified.

701,809. ELECTRIC SWEATING-ROBE. ANDREW PHILLIPS, St. Louis, Mo., assignor, by direct and mesne assignments, to Pittsburg Electric Machine Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Sept. 29, 1901. Serial No. 76,378. (No model.)

Claim.—1. An electric sweating-robe comprising the outer layer 1 and the inner layer 2 of equal size, said layers being secured together by a seam around their edges and by a plurality of seams extending longitudinally of the robe, the last-named seams dividing the robe into columns, said columns being wider at the head than at the feet of the robe, and an electric heat-generating wire, signing in form, arranged within said columns, the terminals of the wire being at the outer columns and at the same end of the robe, substantially as described.

2. An electric sweating-robe comprising the outer layer 1 and the inner layer 2 of equal size, said layers being secured together by a seam around their edges and by a plurality of seams extending longitudinally of the robe, the last-named seams dividing the robe into columns, said columns being wider at the head than at the feet of the robe and the inner columns being extended and cut to form a collar, and an electric heat-generating wire, signing in form, arranged within said columns, the terminals of the wire being at the outer columns and at the same end of the robe, substantially as described.

701,810. BATHHOUSE CONSTRUCTION. ROSS PLANK, Middle Village, N. Y. Filed Mar. 27, 1908. Serial No. 169,515. (No model.)

Claim.—1. In a bathhouse structure, side and end wall posts, each of which is composed of two bars of angle-iron, the upper ends of which are

bent and crossed and secured together to form a trough-support, and the lower ends of which are set into the ground, substantially as shown and described.

2. A bathhouse structure, the supports of which consist of posts composed of angle-iron, the lower ends of which are set into the ground and the upper ends of which are bent and crossed at an angle and secured together where crossed, so as to form a trough-support and a trough placed therein and forming a support for the rafters of the roof, substantially as shown and described.

701,811. CALCULATING-MACHINE. WILLIAM G. POWELL, Jacksonville, Fla., assignor to Eugene O. Locke, Jacksonville, Fla. Filed July 25, 1901. Serial No. 98,398. (No model.)

Claim.—1. In a calculating-machine, the combination, with a front plate, a revolvable ring, and a disk journaled concentric with the said ring and provided with a circular series of holes; of a catch formed of a twisted strip of sheet metal secured at one end under the said plate and provided with a pin which engages with the holes of the said disk, and a stud which projects upwardly from the free end of the said catch through the said front plate and affords a means for disengaging the said catch-pin from the disk, substantially as set forth.

2. In a calculating-machine, the combination, with a front plate, a revolvable ring, and a revolvable disk; of locking mechanism which locks and releases the said ring and disk alternately to the said front plate, substantially as set forth.

3. In a calculating-machine, the combination, with a front plate, a revolvable ring, and a disk journaled concentric with the said ring and provided with a circular series of holes; of a catch provided with a pin which normally engages with one of the said holes, and a friction-brake which bears on the said ring when the catch-pin is disengaged from the disk, substantially as set forth.

4. In a calculating-machine, the combination, with a front plate, a revolvable ring provided with a circular series of holes, and a disk journaled concentric with the said ring and also provided with a circular series of holes; of a stop-bar formed of a flat strip of sheet metal secured at one end only to the said front plate and projecting across the said ring and the adjacent holes of the disk, substantially as set forth.

5. In a calculating-machine, the combination, with a front plate, and a revolvable ring and a disk arranged concentric with each other; of a stop-bar formed of a flat strip of sheet metal secured at one end only to the said plate and having a laterally-projecting lobe at its free end over the said disk, substantially as set forth.

6. In a calculating-machine, the combination, with a front plate, and a revolvable ring and a disk each provided with a circular series of holes; of an arm pivoted concentric with the said ring and disk, and a guide slidable longitudinally on the said arm and carrying an operating-pin for engaging with the holes of either series, substantially as set forth.

7. In a calculating-machine, the combination, with a front plate provided with a zero-space, and a revolvable ring and a disk; of a stop-bar secured at one end to the said plate adjacent to the said zero-space and provided with a laterally-projecting lobe at its free end and arranged over the said disk in line with the said zero-space, and an arm for operating the said ring and disk, said arm being pivoted concentric with the said ring and disk and provided with a laterally-extending pointer which points to the space on the said front plate in line with the said lobe, a zero-space being formed between the said bar and arm, substantially as set forth.

8. In a calculating-machine, the combination, with a front plate, and a revolvable ring and disk; of an additional disk pivoted concentric with the said ring and disk and provided with a circular series of holes, and a spring stop-bar secured to the said front plate at one end and provided at its free end with a catch-pin for engaging with the said holes of the additional disk, substantially as set forth.

9. In a calculating-machine, the combination, with a front plate, and a back plate secured to the front plate; of a ring provided with offset flanges which bear on the said back plate and having a trip between the said flanges, a disk journaled in the said ring and provided with a circular series of holes, and a spring-catch secured at one end to the back plate and provided with a pin which engages with the said holes and having a projection arranged in the path of the said trip between the said flanges, substantially as set forth.

10. In a calculating-machine, the combination, with a front plate provided with supporting-flanges, of a back plate suspended from the surface of the front plate above the bottom edges of the said flanges, and a revolvable calculating-ring journaled in the said holes and provided with a peripheral flange which projects under the front plate and is supported by the said back plate, substantially as set forth.

11. In a calculating-machine, the combination, with a front plate provided with supporting-flanges and a hole, of a back plate suspended from the surface of the front plate above the bottom edges of the said flanges, and a revolvable calculating-ring journaled in the said hole and provided with a peripheral flange which projects under the front plate and is supported by the said back plate, substantially as set forth.

12. In a calculating-machine, the combination, with a front plate provided with a hole, of a back plate secured to the front plate and provided with upwardly-projecting antifriction-bearings, and a revolvable calculating-ring journaled in the said hole and resting on the said antifriction-bearings of the back plate, substantially as set forth.

13. In a calculating-machine, the combination, with a rectangular front plate provided with supporting-flanges, of a back plate provided with radial arms which project under the corner portions of the front plate, fastening devices which secure the end portions of the said arms to the under side of the front plate, and revolvable calculating mechanism supported by the said arms, substantially as set forth.

14. In a calculating-machine, the combination, with a front plate provided with a hole, of a back plate secured to the front plate, a calculating-ring journaled in the said hole and supported by the said back plate and provided with an internally-projecting flange, a calculating-disk journaled in the said ring and resting on the said flange, and a tension device supported from the said back plate and operating to press the said disk against the flange of the said ring so as to afford a prearranged frictional resistance, substantially as set forth.

701,812. LEVELING INSTRUMENT. GEORGE E. FARR, New York, N. Y. Filed Feb. 28, 1908. Serial No. 98,971. (No model.)

Claim.—1. A leveling instrument comprising a trough for containing liquid, a float arranged in the trough, adjustable means for holding

the float from turning axially, an eyepiece carried on one side of the float, and a diaphragm carried on the opposite side of the float, substantially as specified.

2. A leveling instrument comprising a circular trough, a circular float arranged in the trough, sight devices carried on the float, and adjustable means for holding the float from rotary movement, substantially as specified.

3. A leveling instrument comprising a circular trough having a tubular upwardly-extended circular portion, a plate secured to the upper end of said circular portion, a plumb-bob rod supported by said plate and having a portion extended above the plate, a float arranged in the trough and having an opening at its center through which said upwardly-extended end of the rod passes loosely, and sight devices on opposite sides of said float, substantially as specified.

4. A leveling instrument comprising a trough, a float arranged therein and having recesses for receiving shot or the like, and sight devices forming covers for said recesses, substantially as specified.

5. A leveling instrument comprising a circular trough, a float arranged in said trough, sight devices on said float, a pin extended from the float, and a weight movable around the trough and with which said pin engages in hold the float from rotary movement, substantially as specified.

701,818. MOUTHPIECE FOR CIGARS OR CIGARETTES. JOSEPHINE E. KAMMER, Bismarck, N. D., assignor to J. E. Kammer, Bismarck, N. D. Filed June 12, 1901. Serial No. 98,171. (No model.)

Claim.—In a cigar or cigarette mouthpiece, the combination of a sound-producing tongue mounted within the mouthpiece a lateral hole in the lower in proximity to said tongue and means for closing and opening the said hole as will substantially as described.

701,814. STERN-APRON FOR VEHICLES. WILLIAM E. KIMM, Oakland, Cal. Filed Mar. 24, 1902. Serial No. 98,768. (No model.)

Claim.—An improved stern-apron for vehicles consisting of two essential parts namely, a front plate fitting the dashboard and having forked extensions formed upon one side and folded, and a rectangular body portion having its front edge cut divergent from the center toward the sides and secured to the forked portion of the front plate, said front plate including the dashboard and said forked portion and the sides of the main portion extending down over the outside of the side rail of the carriage-body.

701,815. FLEXING DEVICE FOR CONNECTING STATIONARY OR MOVABLE MACHINE PARTS. FREDERICK SCHUMACHER, Berlin, Germany. Filed Nov. 17, 1906. Serial No. 36,904. (No model.)

Claim.—1. In combination with a reciprocating part, a part laterally arranged in respect thereto and connected thereto to serve therewith and a tube having longitudinal and lateral flexion forming a closed space between said moving parts, substantially as described.

2. In combination, the piston *f*, a lever *a*, pivotally supported, an arm *i* connecting the same with the piston and a flexible tube including the piston-rod and the arm *i* and having lateral flexion under the movement of the parts, substantially as described.

3. In combination, the vertically-reciprocating piston *f*, the lever *a* pivoted at one side of the piston and having a laterally-extending arm *i* connected with the piston and a curved flexible tube including the piston-rod and arm and having vertical flexion under the movement of the parts.

701,615.

701,616. DENTAL TOOL FOR SLITTING CAP-CROWNS. CLAYTON J. RYTHOLM, PHILADELPHIA, Pa. Filed Dec. 27, 1901. Serial No. 57,408. (No model.)

Claim.—1. A dental tool for slitting cap-crowns, comprising a pair of forceps having an independently-adjustable bearing-head and an independently-adjustable cutting or slitting blade arranged to cooperate with the adjustable bearing-head, for slitting cap-crowns in the operation of removing cap-crowns from a tooth, substantially as set forth.

2. A dental tool for slitting cap-crowns, comprising a pair of forceps having jaw portions, one of which is provided with a socket and the other a detent, and an adjustable bearing-head having a shank located in said socket, an adjustable cutting or slitting blade mounted in the distal portion of the other jaw, substantially as set forth.

3. A dental tool for slitting cap-crowns, comprising a pair of jaws, an adjustable bearing-head, an adjustable cutting or slitting blade, a socket in the end of one jaw for the bearing-head, means on the other jaw for supporting the blade, said bearing-head provided with a shank having annular grooves, and a pin for engaging with said grooves, substantially as set forth.

701,617. GOLD-BALL. FRANK H. RICHARDS, Hartford, Conn., assignor to The Knapp Manufacturing Company, a Corporation of New Jersey. Filed Mar. 12, 1903. Serial No. 57,500. (No model.)

Claim.—1. A playing-ball comprising a shell of hard, wear-resisting material distended by a mobile mass of solid material injected thereto; a layer of solid rubber intervening between said shell and said injected mass.

2. In a playing-ball, a spherical shell consisting at least partially of celluloid and distended by plastic material injected thereto; a layer of tensioned solid rubber intervening between said shell and said injected mass.

3. In a playing-ball, a shell formed of hard wear-resisting material and distended by a core of gutta-percha injected thereto; a tensioned layer of solid rubber intervening between said shell and said injected mass.

4. In a playing-ball, a shell formed of hard wear-resisting material and distended by a core of gutta-percha injected thereto; a layer of solid rubber intervening between said shell and said injected mass.

5. In a playing-ball, a shell formed of plastic material and distended by a core of plastic material injected thereto; a layer of solid rubber intervening between said shell and said injected mass.

6. In a playing-ball, an embossed shell formed of celluloid and distended by a gutta-percha core injected thereto; a layer of solid rubber intervening between said shell and said injected mass; and a plug filling the injection-hole in the shell and rubber layer.

7. A playing-ball comprising a seamless or continuous embossed shell

of plastic material distended by a core of plastic material injected thereto; a layer of solid rubber intervening between said shell and said injected mass.

8. In a playing-ball, a seamless or continuous shell of celluloid distended by a mass of mobile material injected thereto; a layer of tensioned solid rubber intervening between said shell and said injected mass.

701,618. DRAW-BAR ATTACHMENT. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to Gould Cutter Company, New York, N. Y., a Corporation of West Virginia. Filed Nov. 30, 1901. Serial No. 57,519. (No model.)

Claim.—1. The combination with a movable draw-bar, of movably-mounted springs adapted to be moved bodily by the draw-bar, means for limiting the movement of said springs in opposite directions, and a movable device connected to said springs whereby both of said springs are strained when the draw-bar is moved in either direction, substantially as set forth.

2. The combination with a laterally-movable draw-bar, of movably-mounted springs adapted to be moved bodily by the draw-bar, means for limiting the inward movement of said springs, and a device movable with said draw-bar and connected to said springs whereby both of said springs are compressed when the draw-bar is moved to either side of a central position, substantially as set forth.

3. The combination with a laterally-movable draw-bar, of movable spring-pockets adapted to be moved by the draw-bar, a stop adapted to limit the inward movement of said spring-pockets, a coiled spring movable with each pocket, and a movable bar connecting the outer ends of said springs, whereby both of said springs are compressed, when the draw-bar is moved to either side of a central position, substantially as set forth.

4. The combination with a laterally-tilting draw-bar, and means for guiding the same, of oppositely-arranged spring-pockets having portions engaged by the draw-bar and adapted to be moved thereby, a stop arranged between said spring-pockets for limiting the inward movement thereof, a coiled spring carried by each pocket, a movable rod passing through said coiled springs and through openings in said pockets, and stops on said rod and engaging the outer ends of said coiled springs, substantially as set forth.

5. The combination with a draw-bar mounted to swing laterally, and a guide-yoke for said draw-bar, of oppositely-arranged spring-pockets mounted on said yoke to slide laterally and having portions engaged by said draw-bar, a stop on said yoke between said spring-pockets, a coiled spring seated in a socket in each spring-pocket, a rod or bar passing through openings in said spring-pockets and through said coiled springs, and stops secured to the opposite ends of said rod or bar and engaging the outer ends of said coiled springs, substantially as set forth.

6. The combination with a draw-bar, and a guide-bar or the like therefor, of a spring-pocket member on one side of said guide-bar and having arms straddling said guide-bar, and a second pocket member bearing against the other side of said guide-bar and secured to said arms, said second member constituting an abutment for said draw-bar, substantially as set forth.

701,619. GAS-WASHER. PAUL RIMMER, Dusseldorf, Germany. Filed Nov. 4, 1901. Serial No. 57,520. (No model.)

Claim.—1. A gas-washer, comprising an exterior casing, vertical partitions therein forming compartments communicating with each other adjacent to the center of the casing, a rotary shaft extending centrally through the casing, perforated disks fastened to the shaft in each of said compartments, for the purpose specified, and agitator-chains hung loosely over the shaft between the disks.

2. A gas-washer, comprising an exterior casing, vertical partitions therein forming compartments communicating with each other adjacent to the center of the casing, a rotary shaft extending through the casing, perforated disks fastened to the shaft in each of said compartments, for the purpose specified, and agitator devices hung loosely from the shaft between the disks.

3. A gas-washer, comprising a casing having a gas-inlet and a gas-outlet respectively at its end portions, a rotary shaft running through the casing, disks fastened to the shaft and turning therewith to retard the passage of the gas, and agitator devices hung loosely from the shaft between the disks, whereby to clean the disks as they turn.

701,620. PROCESS OF MAKING INDIFFERENT-POWDER. JULIUS ROTHEN, Kassel, Germany. Filed Dec. 2, 1901. Serial No. 57,521. (No specimens.)

Claim.—A process for producing a powder from alcohol, sublimate, condensed-quinolizer and veratrine, which consists in adding to a weak solution of about nine parts by weight of alcohol in alcohol, under the addition of common salt, an alcoholic solution of about one-half part by weight of sublimate and one-half part by weight of condensed-quinolizer, then adding, for each gram of this mixture of sublimate, condensed-quinolizer and alcohol, an alcoholic solution of about 0.014 grams of veratrine, vaporizing the whole in a water-bath in a thick fluid consistency, drying in moderate heat, grinding to a powder and mixing with lactose in the manner and for the purpose substantially as described.

701,621. CIRCUIT-BREAKER. BENJAMIN F. RUCKER, Brooklyn, N. Y. Filed Nov. 28, 1901. Serial No. 57,522. (No model.)

Claim.—1. In an electric-circuit breaker a movable member, means controlled by the movement of said member for releasing said member instantaneously under a predetermined excess of current and for releasing said member after the duration of another predetermined excess of current.

2. In combination with a movable member of an electric-circuit breaker, means for releasing said member instantaneously under a predetermined excess of current, and an electromagnetic device controlled by the movement of said member and adapted to release the latter after the duration of another predetermined excess of current.

3. In combination with a movable member of an electric-circuit breaker, means for releasing said member instantaneously under a predetermined excess of current, means for releasing said member after the duration of another predetermined excess of current, an electromagnetic device controlling said latter means, said electromagnetic device being actuated by an electric circuit controlled by the movement of the member due to an excess of current in the circuit controlled by the circuit-breaker.

4. In combination with a movable member of an electric-circuit breaker, means for releasing said member instantaneously under a predetermined excess of current, means for releasing said member after the duration of another predetermined excess of current, an electromagnetic device controlling said latter means and being situated in a normally open circuit, and devices actuated by the movement of the member for closing said circuit.

5. In combination with a movable member of an electric-circuit breaker, an electromagnetic device, means actuated by the movement of

said member for controlling the circuit of said electromagnetic device, said electromagnetic device being adapted to release the member after the duration of a predetermined excess of current, and means for instantaneously releasing said member from the device controlling the current under a predetermined excess of current of a different degree.

6. In combination with a movable member of an electric-circuit breaker, an electromagnetic device for releasing said member after the duration of a predetermined excess of current, a switch controlling the circuit of said electromagnetic device adapted to be engaged and operated by the movement of the member, said member being adapted to be instantaneously released from said switch under another predetermined excess of current of a different degree.

7. In combination with a movable member of an electric-circuit breaker, an electromagnetic device for releasing said member after the duration of a predetermined excess of current, a switch for controlling the circuit of said electromagnetic device situated in the path of said member and adapted to be engaged and operated thereby, said member being adapted to be instantaneously released from said switch upon a predetermined excess of current of a different degree.

8. In combination with a movable member of an electric-circuit breaker, an electromagnetic device for releasing said member after the duration of a predetermined excess of current, pivoted switches situated in the circuit controlling said electromagnetic device, and in the path of said member, said switches being normally engaged and held open by contact with the member, said member forming part of the circuit of the electromagnetic device, and said switches being adapted to be released from said member by the movement thereof upon a predetermined excess of current of a different degree.

9. In combination with a movable member of an electric-circuit breaker, an electromagnetic device, gearing between said electromagnetic device and said member for rotating the latter, the circuit of said electromagnetic device being controlled by a switch operated by the movement of said member, and means for disengaging said member and switch upon the rotation of said member.

10. In combination with a movable member of an electric-circuit breaker, an electromagnetic device, gearing between said electromagnetic device and said member for rotating the latter, the circuit of said electromagnetic device being controlled by a switch operated by the movement of said member, and means for disengaging said member and switch upon the rotation of said member, said member being also adapted to be released from said switch by reason of the longitudinal movement of said member under an excess of current greater than that which rotates said member.

11. In combination with a movable member of an electric-circuit breaker, an electromagnetic device, connections between the same and said member for rotating the latter, a switch controlled by the longitudinal movement of the latter, and means for disengaging the member and switch by reason of either the longitudinal or rotary movement of said member.

12. In combination with a movable member of an electric-circuit breaker, of an electromagnetic device, the movable member of said electromagnetic device being connected with the circuit-breaker member to rotate the same, rotating device for said electromagnetic device member, a switch controlling the circuit of said electromagnetic device, said circuit-breaker member engaging said switch and adapted to operate the same when the circuit-breaker member moves longitudinally, said circuit-breaker member being adapted to be disengaged from said switch by a longitudinal or rotary movement of said member.

13. In combination with a movable member of an electric-circuit breaker, provided with annular shoulders, an electromagnetic device connected with said member for rotating the same, a switch in the circuit of said electromagnetic device adapted to be engaged by said shoulders and operated by the longitudinal movement of the member, one of said shoulders terminating so as to disengage the member and switch by the rotary movement of the member, and said member being also adapted to be released from the switch by reason of the longitudinal movement of said member.

14. In combination with a movable member of an electric-circuit breaker, a rotatable member mounted thereon and provided with shoulders, an electromagnetic device connected with said member for rotating the latter, a switch controlling the current of said electromagnetic device, and adapted to be engaged by said shoulders and operated by the longitudinal movement of the member, one of said shoulders being terminated so as to disengage the member and switch by the rotary movement of the member, and said member being also adapted to be released from the switch by reason of the longitudinal movement of said member.

15. In combination with a movable member of an electric-circuit breaker, having annular shoulders, an electromagnetic device connected with said member for rotating the latter, a pivoted switch controlling the circuit of said electromagnetic device and having one end directed be-

between said shoulders of the member as to be operated by the longitudinal movement of the latter, one of said shoulders terminating so that the member and switch are disengaged by the rotary movement of the member, and said switch being also adapted to turn upon its pivot and to be disengaged from said member upon the longitudinal movement of the latter.

16. In combination with a movable member of an electric-circuit breaker, an electromagnetic device connected therewith for rotating the same, switches situated to engage contacts in the circuit controlling said electromagnetic device, said member engaging said switches and normally holding the same away from said contacts and adapted to move them in contact therewith upon the longitudinal movement of the member, said member forming part of the circuit, and means for disengaging said member and switches by the rotary movement of said member.

17. In combination with a movable member of an electric-circuit breaker, an electromagnetic device for rotating the same, a switch operated by the longitudinal movement of the member for controlling the circuit of said electromagnetic device, said member and switch being adapted to be disengaged by the rotary movement of the former, and said switch being carried by a member movable longitudinally to a limited extent with said member.

18. In combination with a movable member of an electric-circuit breaker, an electromagnetic device for rotating the same, a switch controlling the circuit of said electromagnetic device and engaged by said member, said switch being carried by a member movable longitudinally to a limited extent with said member, said member and switch being adapted to be disengaged either by the rotary or longitudinal movement of the member.

19. In combination with a movable member of an electric-circuit breaker having shoulders, an electromagnetic device for rotating the same, a switch for said electromagnetic device having contacts, a longitudinally-movable member carrying pivoted switches adapted to engage said contacts, said switches being engaged by said shoulders of the member, one of the shoulders of said member being broken away whereby the same can be disengaged from the switches upon the rotary movement of the member.

20. In a device of the kind specified, a longitudinal and rotatable circuit-breaker member controlling a switch for the purpose described, said switch being carried by a member longitudinally movable to a limited extent with said circuit-breaker member, and means for increasing and decreasing the weight of said member.

21. In a device of the kind specified, a longitudinal and rotatable circuit-breaker member controlling a switch for the purpose described, said switch being carried by a cap longitudinally movable to a limited extent with said member and adapted to receive a removable weight.

22. In combination with a member of an electric-circuit breaker, a rotatable spindle supporting the same and with which said member rotates and upon which it moves longitudinally, an electromagnetic device for rotating said spindle, a switch controlling the circuit of said electromagnetic device engaged by said member and from which it is adapted to be disengaged either by the longitudinal or rotary movement of said member.

23. In combination with a movable member of an electric-circuit breaker, a rotatable spindle supporting the same and with which said member rotates and upon which it moves longitudinally, a cam upon the said spindle, an electromagnetic device, the movable member of which engages said cam to rotate the same, a switch controlling the circuit of said electromagnetic device and engaged by said circuit-breaker member and from which it is adapted to be disengaged either by the longitudinal or rotary movement of said member.

24. In combination with a movable member of an electric-circuit breaker, an electromagnetic device, the movable member of said electromagnetic device being connected with said circuit-breaker member for rotating the same, a pot into which said electromagnetic device extends, said pot containing a fluid, a dasher upon said electromagnetic device member, a spring acting upon said dasher, a switch controlling the circuit of said electromagnetic device engaged by said circuit-breaker member and from which it is adapted to be disengaged either by the longitudinal or rotary movement of said member.

25. In combination with a movable member of an electric-circuit breaker, provided with annular shoulders, an insulating-plate, an electromagnetic device for rotating said member, the circuit of said electromagnetic device having contacts in said insulating-plate, pivoted switches carried by a longitudinal non-rotatable member normally supported by said insulating-plate, said switches adapted to engage said contacts, the inner ends of said switches being engaged by said shoulders of the member, one of said shoulders being cut away so as to disengage said member and switches by reason of the rotary movement of the member, and said member and switches being adapted to be disengaged by reason of the longitudinal movement of said member.

701,622. FASTERLINE. WILLIAM J. BRY, Quincy, Ill. Filed Sept. 12, 1891. Serial No. 75,608. (No Model.)

Claim.—1. In a pasteurizer, the combination of an atmosphere-compartment, a sterilizing-compartment, a cooling-compartment, means exterior of the machine and out of communication with the sterilizing-compartment for creating a circulation between the atmosphere and cooling compartments, means for automatically starting and stopping said circulating means, and means for carrying the substance to be sterilized through said compartments, substantially as set forth.

2. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, a pair of water-legs forming a cooling-compartment, means for conveying the bottles through said legs, and means for creating a circulation of water between the atmosphere-compartment and cooling-compartment, substantially as set forth.

3. In a pasteurizer, the combination of an atmosphere-compartment, a sterilizing-compartment, a cooling-compartment, means exterior of the machine and out of communication with the sterilizing-compartment for creating a circulation between the atmosphere-compartment and the cooling-compartment, and means for automatically starting and stopping said circulating means, substantially as set forth.

4. In a pasteurizer, the combination of an atmosphere-compartment, a sterilizing-compartment, a cooling-compartment, and automatic means exterior of the machine and out of communication with the sterilizing-compartment for creating a circulation of water between the atmosphere-compartment and cooling-compartment, substantially as set forth.

5. In a pasteurizer, the combination of an atmosphere-compartment, a sterilizing-compartment, a cooling-compartment, a pump and a return-pipe exterior of the machine and out of communication with the sterilizing-compartment for creating a circulation of water between the atmosphere-compartment and cooling-compartment, and a valve and regulator for automatically controlling the passage of water from said pump to said atmosphere-compartment as the temperature therein rises and falls, substantially as set forth.

6. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, and a pair of water-legs forming a cooling-compartment, means for conveying the bottles through said water-legs, and automatic mechanism for creating a circulation of water between the atmosphere-compartment and the cooling-compartment, substantially as set forth.

7. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, a pair of water-legs forming a cooling-compartment, means for conveying bottles through said compartments, and means for causing a circulation of water from one water-leg of the sterilizing-compartment to the other water-leg thereof, substantially as set forth.

8. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, a pair of water-legs forming a cooling-compartment, means for conveying the bottles through said water-legs, means for creating a circulation of water between the atmosphere-compartment and the cooling-compartment, and means for creating a circulation of water between the two water-legs of the sterilizing-compartment, substantially as set forth.

9. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, a pair of water-legs forming a cooling-compartment, means for conveying the bottles through said compartments, automatic means

for controlling a circulation of water from the cooling-compartment to the atmosphere-compartment as the temperature rises and falls, and means for maintaining a circulation of water between the two water-legs of the sterilizing-compartment, substantially as set forth.

10. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, a pair of water-legs forming a cooling-compartment, means for conveying the bottles through said compartments, means for causing a circulation of water through the atmosphere and cooling compartments in a direction contrary to that in which the bottles move, and means for causing a circulation of water through the sterilizing-compartment in the same direction that the bottles move, substantially as set forth.

11. In a pasteurizer, the combination of an atmosphere-compartment, a two-part sterilizing-compartment, a cooling-compartment, means for creating a circulation between the atmosphere-compartment and cooling-compartment, means for creating an independent circulation between the two parts of the sterilizing-compartment, and means for carrying the substance to be sterilized through said compartments, substantially as set forth.

12. In a pasteurizer, the combination of a pair of water-legs forming an atmosphere-compartment, a pair of water-legs forming a sterilizing-compartment, a pair of water-legs forming a cooling-compartment, means for conveying the bottles through said legs, means for causing a circulation of water between the atmosphere-compartment and the cooling-compartment, and means for causing an independent circulation of water through the two legs of the sterilizing-compartment, substantially as set forth.

701,623. SAWING, JOINING, AND BORING MACHINE. CHARLES E. SANDSTROM, Chicago, Ill. Filed Jan. 30, 1898. Serial No. 70,872. (No Model.)

Claim.—1. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and means for reciprocating the supports while the saws are rotated so that the cutting-off saw furthest from the work-holding table shall complete its cut before the completion of the cut of the other saw.

2. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and means for reciprocating the supports simultaneously during the rotation of the saws, but so that the saw furthest from the work-holding table shall meet the work in advance of the other saw.

3. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, said ways being adjustably mounted so as

to vary the angles of the saws relative to each other and to the work-holding table, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and means for reciprocating the supports while the saws are rotated so that the saw furthest from the work-holding table shall complete its cut before the completion of the cut of the other saw.

4. In a machine of the class described, the combination of two cutting-off saws each having separate supports, the support for one saw being located in advance of the other, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, a work-holding table at one side of said ways adjacent the rearward support and upon which the material is held during the movement of the saws, and means for reciprocating said supports simultaneously while the saws are rotated so that the saw in the forward support shall complete its cut before the completion of the cut of the other saw.

5. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, a work-holding table at one side of said ways and adjustable to vary the angle at which the material held thereon is presented to the saws, and means for reciprocating the supports while the saws are rotated so that the cutting-off saw furthest from the work-holding table shall complete its cut before the completion of the cut of the other saw.

6. In a machine of the class described, the combination of two shafts each having separate supports and carrying a plurality of saws comprising a cutting-off saw and one or more grooving-saws, and means for rotating the said shafts, with ways arranged at an oblique angle to each other in which said supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and means for reciprocating the supports while the saws are rotated so that the cutting-off saw of the group furthest from the work-holding table shall complete its cut before the completion of the cut of the other cutting-off saw, the supports for one set of saws being located above the table so as to bring the lower teeth of the cutting-off saw below the top of the table and of the grooving-saws above it, and the supports for the other shaft located beneath the table so as to bring the upper teeth of the cutting-off saw above the table to cut through the material and of the grooving-saws so as to cut into the material.

7. In a machine of the class described, the combination of a plurality of cutting-off saws each having separate supports, and means for rotating said saws, with a plurality of ways corresponding in number to the supports pivotally mounted upon a single pivot and arranged at an oblique angle to each other and in which the supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and means for reciprocating the supports while the saws are rotated so that the cutting-off saw furthest from the work-holding table shall complete its cut before the completion of the cut of the adjacent saw.

8. In a machine of the class described, the combination of a plurality of cutting-off saws each having separate supports, and means for rotating said saws, with a corresponding plurality of ways pivotally mounted upon a single support and arranged at an oblique angle to each other and in which the supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and a single means for reciprocating all of said supports, the supports furthest from the table being located in advance of the adjacent supports so that the cutting-off saw furthest from the table shall complete its cut before the completion of the cut of an adjacent saw.

9. In a machine of the class described, the combination of a plurality of cutting-off saws each having separate supports, and means for rotating said saws, with a corresponding plurality of ways pivotally mounted upon a single support and arranged at an oblique angle to each other and in which the supports may be reciprocated, and adjustable to vary the angles of the saws relative to each other and to the table, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and a single means for reciprocating all of said supports, the supports furthest from the table being located in advance of the adjacent supports so that the cutting-off saw furthest from the table shall complete its cut before the completion of the cut of an adjacent saw.

10. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, a pair of drills located adjacent to the table, means for driving said drills, means for reciprocating the supports while the saws are rotated in that the cutting-off saw furthest from the work-holding table shall complete its cut before the completion of the cut of the other saw to sever the

trapenoid, and means for advancing said drills while they are driven to penetrate the material before the trapenoid is cut off.

11. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, a pair of drills located adjacent to the table, means for driving said drills, and means for simultaneously advancing said drills and reciprocating said supports so that the cutting-off saw furthest from the work-holding table shall complete its cut and the drills shall have penetrated the material before the completion of the cut of the other saw.

12. In a machine of the class described, the combination of two cutting-off saws each having separate supports, and means for rotating said saws, with ways arranged at an oblique angle to each other in which the supports may be reciprocated during the movement of the saws, a pair of drills located adjacent to the table and adjustable relative thereto, means for driving said drills, and means for simultaneously advancing said drills and reciprocating said supports so that the cutting-off saw furthest from the work-holding table shall complete its cut and the drills shall have penetrated the material before the completion of the cut of the other saw.

13. In a machine of the class described, the combination of the two shafts each having separate supports and carrying a plurality of saws comprising a cutting-off saw and two grooving-saws, the grooving-saw adjacent the cutting-off saw being the smaller, and means for rotating said shafts, with ways arranged at an angle to each other in which said supports may be reciprocated, a work-holding table at one side of said ways upon which the material is held during the movement of the saws, and means for reciprocating the supports while the saws are rotated so that the saw furthest from the work-holding table shall complete its cut before the completion of the cut of the other cutting-off saw.

14. In a machine of the class described, the combination of a plurality of saws each having separate supports, and means for rotating said saws, with a plurality of ways corresponding in number to the supports and in which said supports may be reciprocated, a work-holding table upon which the material is held during the movement of the saws, and means for reciprocating said supports so that while all the saws cut the same integral piece of material at the same operation, one saw shall meet the work in advance of another.

15. In a woodworking-machine, the combination of two or more saws arranged at different angles and having mechanism for driving them and means for advancing them upon the work, with a drill and means for driving it and, for advancing it upon the work, a guide-table for holding the material adjustable to different angles relative to said saws.

16. In a woodworking-machine, the combination of two or more saws arranged at different angles and means for driving them and for advancing them upon the work, with a drill and means for driving it and for advancing it upon the work, means for adjusting the position of the drill relative to the saws, and a guide-table adjustable with said drill.

17. In a woodworking-machine, the combination of the saw-supports sliding in ways, with the drill-shaft sliding in its bearings, and the lever *IV* connected to said support and to the drill-shaft, means for raising and lowering said lever, and means for automatically advancing and retracting said lever to reciprocate the saw-support and the drill-shaft.

18. In a machine for sawing off blocks and boring holes therein in a certain relation to the sawed-off edge, the combination with a work-supporting table, of a cutting-off saw, means for rotating it, a support for the saw, a way in which said support can be reciprocated to advance it upon the work, a drill adjacent said way and adapted to be advanced toward and to operate upon the portion of the work being sawed off, means for rotating said drill, and means for simultaneously reciprocating the saw-support and advancing the drill so that the drill shall penetrate the work before the saw has completed the sawing of that portion.

19. In a machine for sawing off blocks and boring holes therein in a certain relation to the sawed-off edge, the combination with a work-supporting table, of two cutting-off saws, means for rotating them, two supports for the respective saws, two ways in which said supports can be reciprocated to advance upon the work, a drill between said ways and adapted to be advanced toward and to operate upon the portion of the work being sawed off, means for rotating said drill, and means for simultaneously reciprocating the saw-supports and advancing the drill so that it shall penetrate the work before the saws have completed the sawing of the portion being drilled.

20. In a machine for sawing off blocks and boring holes therein in a certain relation to the sawed-off edge, the combination with the work-supporting table, of two cutting-off saws, means for rotating them, supports for the saws, ways in which said supports may be reciprocated adjustably to vary the angle at which the saws shall be advanced upon the work, two drills interspersed between said ways, means for driving them, mechanism for adjusting the position of the drills to vary the location of

the holes in relation to the cut of the saws upon the material, and means for simultaneously reciprocating the saw-supports and advancing the drills so that the drills shall penetrate the work before the saws have covered the portion being operated upon.

21. In a woodworking-machine, the combination of a plurality of cutting-off saws, a separate support for each saw, a corresponding number of ways in which the supports may be reciprocated to advance the saw upon the work, means for rotating said saws, a work-supporting table located at one side of said ways, means for adjusting the position of said table relative to said ways to vary the angle at which the saws are presented to the work, and means for reciprocating said supports so that the cut of the saw furthest from the table shall be completed first.

22. In a woodworking-machine, the combination of a plurality of cutting-off saws, separate supports for each saw, a corresponding number of ways adjustable to vary the angle between the saws, means for rotating said saws, a work-supporting table located at one side of said ways, means for adjusting the position of said table relative to the ways to vary the angle at which the saws shall be presented to the work, and means for reciprocating said supports so that the cut of the saw furthest from the table shall be completed first.

23. In a woodworking-machine, the combination of a plurality of cutting-off saws, separate supports for each saw, a corresponding number of ways adjustable to vary the angle between the saws, means for rotating said saws, a work-supporting table located at one side of said ways, means for adjusting the position of said table relative to the ways to vary the angle at which the saws shall be presented to the work, means for reciprocating said supports so that the cut of the saw furthest from the table shall be completed first, and a clamping-bar for holding the material upon said table.

701,824. MACHINE FOR FORMING ELLIPTICAL FRAMES.
CHARLES E. SANDHORN, Chicago, Ill. Filed Feb. 17, 1899. Serial No. 705,808. (No model.)

Claim.—1. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and simultaneously reciprocating and rotating it to cause any point of it to move through an ellipse, comprising a stationary guideway, a carriage reciprocating longitudinally thereof, and the supporting-frame rotating on said carriage.

2. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and simultaneously reciprocating and rotating it to cause any point of it to move through an ellipse, comprising a stationary guideway, a carriage reciprocating longitudinally thereof, and the supporting-frame rotating on said carriage, together with a rotating shaft mounted in said carriage and having an eccentric thereon, and a link connecting said eccentric and the frame of the stationary guideway.

3. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically reciprocating it, comprising a stationary guideway upon which the frame reciprocates, a rotating shaft mounted in said reciprocating frame and having an eccentric thereon, and a link connecting said eccentric and the framework of the stationary guideway.

4. In a machine of the class described, the combination of a supporting-frame, with mechanism for simultaneously and automatically reciprocating and rotating it so as to cause any point of it to move through

an ellipse, said mechanism comprising a stationary guideway, a carriage reciprocating longitudinally thereof, means for reciprocating said carriage, a supporting-frame rotating on said carriage, a shaft rotating in said carriage and carrying a pinion, and a circular rack or gear on the supporting-frame meshing with said pinion.

5. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically moving it at intervals so as to cause any point on it to move through an ellipse.

6. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and simultaneously reciprocating and rotating it to cause any point on it to move through an ellipse, said mechanism comprising a rotating shaft mounted in a reciprocating carriage upon which the supporting-frame rotates, connections operated by said shaft for reciprocating the carriage and rotating the supporting-frame thereon, and a clutch operated automatically for throwing said rotating shaft into and out of operation to cause the mechanism to operate at intervals.

7. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and simultaneously reciprocating and rotating it to cause any point on it to move through an ellipse, said mechanism comprising a stationary guideway, a carriage reciprocating longitudinally thereof, a supporting-frame rotating in said carriage, a rotating shaft mounted in said carriage and having an eccentric thereon, a link connecting said eccentric and the framework of the stationary guideway, and a clutch operated automatically for throwing said rotating shaft into and out of operation to cause the mechanism to operate at intervals.

8. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and simultaneously reciprocating and rotating it to cause any point on it to move through an ellipse, said mechanism comprising a stationary guideway, a carriage reciprocating longitudinally thereof, a supporting-frame rotating in said carriage, a rotating shaft mounted in said carriage and having an eccentric thereon, a link connecting said eccentric and the framework of the stationary guideway, and a clutch for throwing said rotating shaft into and out of operation.

9. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and simultaneously reciprocating and rotating it to cause any point on it to move through an ellipse, said mechanism comprising a stationary guideway, a carriage reciprocating longitudinally thereof, a supporting-frame rotating in said carriage, a rotating shaft mounted in said carriage and having an eccentric thereon, a link connecting said eccentric and the framework of the stationary guideway, a clutch controlling the operation of said shaft, and means for automatically shifting said clutch at intervals to control the movement of the supporting-frame.

10. In a machine of the class described, the combination of a rotating supporting-frame, with a forming-tool journaled adjacent to said frame, and gearing and connections for rotating said frame and simultaneously rotating said tool at a rate synchronous with the movement of the supporting-frame.

11. In a machine of the class described, the combination of a supporting-frame, with a forming-tool journaled adjacent to said frame and geared to rotate synchronously therewith, and means for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

12. In a machine of the class described, the combination of a supporting-frame, with a forming-tool geared to said frame to rotate therewith, and mechanism for automatically and simultaneously reciprocating and rotating said frame to cause it to move through an ellipse relative to said tool.

13. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith by means of a gear-pinion on said tool meshing with a rack on said frame for rotating said tool, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting the tool longitudinally to vary the size of the elliptical surface cooperating therewith.

14. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically and simultaneously reciprocating and rotating said frame to cause it to move through an ellipse relative to said tool, and mechanism for rotating said tool at a rate of speed corresponding to the movement of the frame beneath it.

15. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting said tool longitudinally and vertically for the purpose described.

16. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an

ellipse, said mechanism comprising a stationary guideway, a carriage reciprocating longitudinally thereof, means for reciprocating said carriage, a supporting-frame rotating on said carriage, a shaft rotating in said carriage and carrying a pinion, and a circular rack or gear on the supporting-frame meshing with said pinion.

17. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool at regular intervals, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

18. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool at regular intervals, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

19. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool at regular intervals, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

20. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool at regular intervals, means for rotating said tool when it is in its lower position, and mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool.

21. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for vibrating said tool to keep its axis at right angles to the line of movement of the portion of the frame passing beneath it.

22. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for automatically vibrating said tool to keep its axis at right angles to the line of movement of the portion of the frame passing beneath it.

23. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for vibrating said tool to keep its axis at right angles to the line of movement of the portion of the frame passing beneath it.

24. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically and simultaneously reciprocating and rotating said frame to cause it to move through an ellipse relative to said tool, and means for automatically vibrating said tool to keep its axis at right angles to the line of movement of the portion of the frame passing beneath it.

25. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for raising and lowering said tool, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for vibrating said tool to keep its axis at right angles to the line of movement of the portion of the frame passing beneath it.

26. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting the tool longitudinally to vary the size of the elliptical surface cooperating therewith.

27. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting the tool angularly to vary the angle of the tool relative to the surface of the frame.

28. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting said tool longitudinally and vertically for the purpose described.

29. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting said tool longitudinally and vertically for the purpose described.

30. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an

elliptical relative to said tool, and means for adjusting the tool angularly and vertically for the purpose described.

31. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, and means for adjusting the tool angularly, longitudinally and vertically for the purpose described.

32. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool, means for vibrating said tool to keep its axis at right angles to the line of movement of the portion of the frame passing beneath it, and means for regulating the amount of said vibration.

33. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically moving it so as to cause any point on it to move through an ellipse, and means for adjusting said mechanism so that the relative lengths of the major and minor axes of the ellipse may be varied as desired.

34. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically and discontinuously reciprocating and rotating it to cause any point on it to move through an ellipse, and means for adjusting said mechanism to vary the length of reciprocation so that the relative lengths of the major and minor axes of the ellipse may be varied as desired.

35. In a machine of the class described, the combination of a supporting-frame, with mechanism for automatically reciprocating it, comprising a stationary guideway upon which the frame reciprocates, a rotating shaft mounted in said reciprocating frame and having an adjustable eccentric thereon, and a link connecting said eccentric and the framework of the stationary guideway.

36. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, adjustable means for raising and lowering said tool, and mechanism for automatically moving said frame so as to cause it to move through an ellipse relative to said tool.

37. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool comprising a rotating cam and a cooperating bearing-surface adjustable vertically, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

38. In a machine of the class described, the combination of a supporting-frame, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool comprising a rotating cam and a cooperating bearing-surface adjustable horizontally, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

39. In a machine of the class described, the combination of a movable supporting-frame, means for moving said frame through a curve, with a forming-tool journaled adjacent said frame, and gearing between said frame and tool whereby the movement of the former rotates the latter synchronously therewith.

40. In a machine of the class described, the combination of a movable supporting-frame, means for moving said frame through a curve, with a forming-tool journaled adjacent said frame, and a rack on said frame having the same curve as that through which the frame is moved, and a pinion on said forming-tool meshing with said rack whereby the movement of the frame rotates the tool synchronously therewith.

701,825. MACHINE FOR FORMING ELLIPTICAL FRAMES.
CHARLES E. SANDSTROM, Chicago, Ill. Filed Aug. 2, 1900. Renewed
Apr. 2, 1902. Serial No. 101,002. (No model.)

Claim.—1. In a device of the class described, the combination with a supporting-plate having two pivoted focal bearings thereon, of a rotating and reciprocating table having the ways formed therein crossing each other at right angles and cooperating with said focal bearings, an elliptical rack rigidly secured to said table, a pinion meshing with said rack, and means for rotating said pinion.

2. In a device of the class described, the combination with a supporting-plate having two pivoted focal bearings thereon, one of said bearings being adjustable to and from the other, of a rotating and reciprocating table having the ways formed therein crossing each other at right angles and cooperating with said focal bearings, an elliptical rack rigidly secured to said table, a pinion meshing with said rack, and means for rotating said pinion.

3. In a device of the class described, the combination with a supporting-plate having two pivoted focal bearings thereon, of a rotating and reciprocating table having the ways formed therein crossing each other at right angles and cooperating with said focal bearings, an elliptical rack

rigidly secured to said table, a pinion meshing with said rack, a forming-tool mounted to rotate adjacent to the table, and means for synchronously rotating said pinion and forming-tool.

4. In a device of the class described, the combination with a supporting-plate having two focal bearings thereon, of a rotating and reciprocating table having the ways formed therein crossing each other at right angles and cooperating with said focal bearings, an elliptical rack rigidly secured to said table, a pinion meshing with said rack, a forming-tool mounted to rotate adjacent to said table, a frame in which said forming-tool is mounted, means for raising and lowering said frame to bring the forming-tool into and out of engagement with the work on the table, a driving-pulley supported by said forming-tool frame, connections between said driving-pulley and forming-tool for rotating the latter, and flexible connections between said driving-pulley and the pinion meshing with the rack to permit the movement of the pulley caused by the raising and lowering of the frame.

5. In a device of the class described, the combination with the frame, of a table mounted to rotate and reciprocate upon said frame, an elliptical rack secured upon said table, a pinion meshing with said rack, means for rotating said pinion, and connections between said frame and table to compel it to move in an elliptical path as its rotation is forced by said pinion.

6. In a device of the class described, the combination with a stationary frame having a supporting-plate pivoted thereto and adapted to swing horizontally thereon, two focal bearings mounted on said plate, a rotating and reciprocating table having the ways formed therein crossing each other at right angles and cooperating with said focal bearings, an elliptical rack rigidly secured to said table, a pinion meshing with said rack, means for rotating said pinion, and mechanism for automatically swinging said plate synchronously with the movement of the table.

7. In a device of the class described, the combination with a stationary framework, of a supporting-plate pivoted thereto and adapted to swing horizontally thereon, two focal bearings mounted on said plate, a rotating and reciprocating table having the ways formed therein crossing each other at right angles and cooperating with said focal bearings, an elliptical rack rigidly secured to said table, a pinion meshing with said rack, a forming-tool adapted to rotate adjacent to said table, and means for synchronously rotating said pinion and forming-tool and automatically swinging said plate, substantially as and for the purpose described.

8. In a device of the class described, the combination with the stationary frame, of a swinging plate pivotedly mounted thereon, a table mounted to rotate and reciprocate relative to said plate, an elliptical rack secured to said table, a pinion meshing with said rack, means for rotating said pinion, connections between said plate and table to compel the latter to move in an elliptical path as its rotation is forced by said pinion, and means for swinging said plate synchronously with the movement of said table, substantially as and for the purpose described.

9. In a device of the class described, the combination with the stationary frame, of a swinging plate pivotedly mounted thereon, a table mounted to rotate and reciprocate relative to said plate, an elliptical rack secured to said table, a pinion meshing with said rack, means for rotating said pinion, connections between said plate and table to compel the latter to move in an elliptical path as its rotation is forced by said pinion, and means for swinging said plate synchronously with the movement of said table, said means comprising a rotating arm journaled in the support for the said plate and having a bearing portion thereof cooperating with an elongated slot or way in the stationary frame, substantially as and for the purpose described.

10. In a device of the class described, the combination with the stationary frame, of a swinging plate pivotedly mounted thereon, a table mounted to rotate and reciprocate relative to said plate, an elliptical rack secured to said table, a pinion meshing with said rack, means for rotating said pinion, connections between said plate and table to compel the latter to move in an elliptical path as its rotation is forced by said pinion, and means for swinging said plate synchronously with the movement of said table, said means comprising a gear-pinion journaled in the support for said plate carrying an arm rigidly secured thereto having a bearing-portion pivoted thereto and cooperating with an elongated slot or way in the stationary frame, substantially as and for the purpose described.

11. In a device of the class described, the combination with the stationary frame, of a swinging plate pivotedly mounted thereon, a table mounted on said plate, gearing for rotating said table upon said plate, and means for swinging said plate synchronously with the movement of the table comprising a rotating arm journaled in the support for said plate and having a bearing portion thereof cooperating with an elongated slot or way in the stationary frame.

12. In a device of the class described, the combination with the stationary frame, of a swinging plate pivotedly mounted thereon, a table mounted on said plate, gearing for rotating and reciprocating said table upon said plate, and means for swinging said plate synchronously with the movement of the table comprising a gear-pinion journaled in the support for said plate and carrying an arm rigidly secured thereto which has a bearing-portion pivoted thereto cooperating with an elongated slot or way in the stationary frame.

13. In a device of the class described, the combination with a forming-tool, of a work-carrying table mounted adjacent to said tool, and means for discontinuously giving an elliptical movement to said table and also swinging it so that the line of movement of any portion of said table as it passes beneath said tool shall always be exactly at right angles to the axis of said tool.

14. In a device of the class described, the combination with a forming-tool, of a work-carrying table and means for discontinuously rotating it and reciprocating it in one direction so as to cause any point of it to move through an ellipse relative to the forming-tool, a swinging support for said table, and means for vibrating said support synchronously with the elliptical movement of the table so that the line of movement of the portion of the table passing beneath the forming-tool is always at right angles to the axis of said tool.

15. In a device of the class described, the combination with a forming-tool, of a work-carrying table mounted adjacent to said tool, and means for discontinuously giving an elliptical movement to said table and also synchronously swinging it the same distance and at a corresponding rate of speed at any point on either side of the center of its arc of vibration so that the line of movement of the portion of the table passing beneath the forming-tool is always at right angles to the axis of said tool.

16. In a device of the class described, the combination with the plate carrying the forming-tool, of the mechanism for reciprocating said plate, and means for automatically stopping said mechanism comprising the bell-shifting bar having the lever pivotedly connected thereto, and a cam-ling on said lever adapted to be contacted by a stop-ling on said plate when it reaches a certain point in its movement.

17. In a device of the class described, the combination with the plate carrying the forming-tool, of the mechanism for reciprocating said plate, and means for automatically stopping said mechanism at the limit of the movement of the plate in either direction, said means comprising the bell-shifting bar for the lever pivotedly connected thereto, and a pair of cam-ling on said lever adapted to be contacted by cooperating stop-ling on the plate when it reaches the desired points in its movement.

18. In a device of the class described, the combination of a supporting-table, with mechanism for automatically moving it so as to cause any point on it to move through an ellipse, a tool-carrying frame movable to and from said supporting-table, and means for automatically moving said tool-carrying frame to and from the table at any time desired by the operator.

19. In a device of the class described, the combination of a supporting-table, with mechanism for automatically moving it so as to cause any point on it to move through an ellipse, a tool-carrying frame movable to

and from said supporting-table, and means for automatically moving said tool-carrying frame to and from the table at any time desired by the operator, said means comprising a bell-shifting bar controlled by the operator and cooperating with flat and loose pulleys on a shaft geared to a screw cooperating with said tool-carrying frame, substantially as described.

20. In a machine of the class described, the combination of a supporting-table, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool comprising a screw cooperating with the support of said forming-tool, and connections for automatically rotating said screw and mechanism for automatically moving said table so as to cause it to move through an ellipse relative to said tool.

21. In a machine of the class described, the combination of a supporting-table, with a forming-tool cooperating therewith, means for automatically raising and lowering said tool at any time desired by the operator, and mechanism for automatically moving the frame so as to cause it to move through an ellipse relative to said tool.

22. In a device of the class described, the combination of the table, and means for moving it through an ellipse, with the forming-tool cooperating therewith and mounted in a frame, means for automatically moving said frame to and from the table, means for stopping the movement of said frame toward the table at a certain distance therefrom, and an adjustable stop on the frame adapted to contact with the stationary part of the machine at the instant the stopping means comes into action.

23. In a device of the class described, the combination with a stationary framework, of a supporting-plate mounted to swing thereon, a table mounted on said plate, a forming-tool mounted to rotate adjacent to said plate, and mechanism for discontinuously swinging said plate, moving said table thereon in an ellipse, and synchronously rotating said tool so that the design upon said tool will be accurately pressed upon an elliptical frame carried by said table.

24. In a device of the class described, the combination with a stationary framework, of a supporting-plate mounted to swing thereon, a table mounted on said plate, means for discontinuously rotating and reciprocating said table upon the plate to move it through an ellipse, and means for swinging said plate synchronously with the movement of the table for the purpose described, said means comprising a rotating arm journaled in connection with said plate and having a bearing portion thereof cooperating with an elongated slot or way in the stationary framework.

25. In a device of the class described, the combination with the grid having the pivotal bearing thereon, a swinging plate mounted on said grid by means of said pivotal bearing, a shaft having its stationary bearing on said grid and provided with a bevel gear-wheel at one end, a shaft having bearings in said plate and having a bevel gear-wheel secured thereon, and on the bevel gear-pinion mounted in line with said pivotal bearing and engaging with the bevel gear-pinion on said shaft, substantially as and for the purpose described.

26. In a device of the class described, the combination with the grid having the pivotal bearing thereon, a swinging plate mounted on said grid by means of said bearing, a shaft having bearings supported by said grid and with a bevel gear-pinion secured to one end thereof, a shaft mounted in bearings in said swinging plate and having bevel gear-pinions at the end thereof and also an intermediate bevel gear-pinion, two shafts suitably mounted in relation to said swinging plate and having bevel gear-pinions on their ends meshing with the bevel gear-pinion on the end of the shaft in said plate, and on the bevel gear-pinion mounted in line with said pivotal bearing and meshing with the bevel gear-pinion on the shaft mounted on the grid and with the intermediate bevel gear-pinion on the shaft mounted in the plate, substantially as and for the purpose described.

27. In a device of the class described, the combination with the stationary frame, of a swinging plate, an arm journaled in said plate and having a bearing at one end cooperating with an elongated slot or way in the swinging plate, and means for rotating said arm.

28. In a device of the class described, the combination with a table and means for rotating it, of a forming-tool and means for rotating it to cooperate with the edge of a frame placed on said table, a second forming-tool and means for rotating it to cooperate with the top of said frame, and mechanism whereby said forming-tools may be shifted alternately into position to operate on said frame.

29. In a device of the class described, the combination with a table and means for rotating it, of a forming-tool and means for rotating it, a support for said tool whereby it can be moved horizontally to bring it into and out of cooperative engagement with the edge of the frame placed on said table, a second forming-tool and means for rotating it, a support for said second tool which can be moved vertically to bring it into and out of cooperative engagement with the top of said frame, and mechanism whereby said supports may be shifted to bring said forming-tools alternately into position to operate on said frame.

30. In a device of the class described, the combination with a table, and means for rotating and reciprocating it discontinuously so as to cause it to move through an ellipse, of a forming-tool and means for rotating it to cooperate with the edge of an elliptical frame placed on said table, a

second forming-tool and means for rotating it to cooperate with the top of said frame, and mechanism whereby said forming-tool may be shifted alternately into position to operate on said frame.

31. In a device of the class described, the combination with a table, and means for rotating and reciprocating it simultaneously so as to cause it to move through an ellipse, of a forming-tool and means for rotating it, a support for said tool whereby it can be moved horizontally to bring it into and out of cooperative engagement with the edge of the elliptical frame placed on said table, a second forming-tool and means for rotating it, a support for said second tool which can be moved vertically to bring it into and out of cooperative engagement with the top of said frame, and mechanism whereby said supports may be shifted to bring said forming-tools alternately into position to operate on said frame.

701,626. STEAM-ENGINE VALVE. ERL L. SAUER, Chicago, Ill. Filed July 26, 1901. Serial No. 60,708. (No model.)

Claim.—1. A steam-engine valve, provided in its opposite side walls with openings into the exhaust-chamber, the bushings, inserted in said openings but stopping short of the exhaust-chamber, means for closing the outer ends of the bushings, the auxiliary piston-valves, provided with reduced ends, and a cushioning-shoulder and having the respective ends loosely inserted in said bushings, and the cushion-spaces between the adjacent surfaces of the piston-valves and bushings, substantially as described.

2. The combination with the main valve, provided with openings in the side walls opposite each other, of the bushings rigidly inserted therein, and open to the exhaust-chamber, but tightly closed at their outer ends, the piston-valves adapted to have a reciprocating movement in said bushings and provided with a cushioning shoulder and space adjacent to the inner ends of the bushings, substantially as described.

3. The combination with the main valve, having openings therethrough into the exhaust-chamber, of the bushings, inserted in said openings, the cap-plates closing the outer ends of the bushings, the piston-valves having their respective ends mounted in the inner open ends of the bushings and having a reciprocating movement across the line of the exhaust-chamber, and means for imparting such movement, substantially as described.

4. The combination with a steam-engine valve having apertures on opposite sides opening into the exhaust-chamber, bushings, open at both ends and seated in said apertures, the steam-tight cap-plates closing the outer ends of said bushings, piston-valves, connected by a common stem and seated in said bushings, the annular space around said bushings, and the crisscross leading therefrom in the space between the ends of the piston-valves, and the adjacent surfaces, substantially as described.

701,627. SWITCH FOR ELECTROMOTORS FOR DRIVING METAL APPARATUS. RUD. SCHNEIDER and HERMANN DÖHLER, Vienna, Austria-Hungary. Filed Jan. 10, 1902. Serial No. 59,281. (No model.)

Claim.—1. The combination with a tool and an electric motor for operating it, of an electric switch controlling the direction of the current in the motor-circuit, an auxiliary electric circuit and one or more solenoids connected therewith for operating said switch, and a push-button on the handle of the tool for opening and closing the auxiliary circuit, substantially as and for the purpose specified.

2. The combination with a tool and an electric motor for operating it, of an electric switch for controlling the motor-circuit, an auxiliary circuit including one or more solenoids for operating said switch, and a spring-contact carried by the handle of the tool for opening and closing said auxiliary circuit, substantially as and for the purpose specified.

3. The combination with a tool and an electric motor for operating it, of an electric switch for controlling the motor-circuit, an auxiliary circuit including one or more solenoids for operating the switch, a spring-contact carried by handle of the tool, and means actuated by the switch for stopping starting and reversing the motor, substantially as and for the purpose specified.

4. The combination with a tool and an electric motor for actuating it of a switch H comprising a cam y surrounding switch-shaft and adapted to guide the cross-pin forming part of said shaft in such a manner that it may rotate and otherwise control its movements, substantially as described.

5. The combination with a tool and an electric motor for actuating it of switch B with solenoids d adapted to impart a pivot motion to arm i and the means to transform this into a vertical as well as revolving motion of shaft j.

6. The combination with a tool and an electric motor for actuating it of solenoids to impart the operating movements in a switch B and a cam surrounding a shaft with a cross-pin to control and guide such movements, substantially as described.

7. The combination with a tool and an electric motor for actuating it, of solenoids to impart a part of the operating movement and a spring or the action of gravity to impart the other part of the operating movement in a switch B, a cam surrounding a shaft with a cross-pin to control and guide such movements, substantially as described.

8. The combination with a tool and an electric motor for actuating it of solenoids to impart the operating movements in a switch B, a pivot-lever with a slot or notch in which the point or end of a shaft rests one or a number of cross-pins or pins a part of said shaft one or a number of cam-surrounding, guiding and controlling the movements of said shaft.

9. The combination with a tool and an electric motor for actuating it of solenoids to impart the operating movements in a switch B, a pivot-lever with a slot or notch in which the point or end of a shaft rests, a number of cross-pins or pins a part of said shaft and arranged so as to guide and control the movement of shaft by means of a cam and to control the opening and closing of an auxiliary switch, substantially as described.

10. The combination with a tool and an electric motor for actuating it of solenoids to impart the operating movements in a switch B an auxiliary switch comprising a switch-lever, a tube fastened to the lever and containing mercury, a plate or disk on this lever with projecting arms adapted to engage with a cross-pin or pin a part of said switch-shaft, substantially as described.

701,628. AUTOMATIC AIR-BRAKE COUPLING. CLYDE E. SHER, Shrewsbury, Pa. Filed Dec. 14, 1901. Serial No. 59,531. (No model.)

Claim.—1. In a device of the kind described, the combination with the tubes of the coupling-heads arranged thereon, one coupling-head having the forwardly-projecting wings at the upper and lower sides, the op-

posing head having the forwardly-projecting wings at its opposite sides, and the forwardly-projecting and outwardly-flaring guard arranged at the side of each coupling-head, substantially as set forth.

2. In a device of the kind described, the combination with a cylinder having an opening in its rear end, of a tube movable longitudinally in the said cylinder and projecting forwardly from the forward end of the said cylinder, the packing arranged at the forward end of the cylinder and between the said cylinder and tube, the flanges for holding the packing in place, the valve for closing the opening at the rear end of the cylinder, said valve being rigidly connected to the rear end of the tube, a coiled spring arranged within the cylinder and surrounding the rear portion of the tube, a collar arranged upon the said tube and against which the forward end of the spring bears, the coupling-head arranged upon the forward end of the tube and having the forwardly-projecting wings arranged at diametrically opposite points and the guard arranged at the side of the coupling-head, substantially as described.

701,629. DUST-GUARD FOR JOURNAL-BOXES. CHARLES E. HALLIDAY, JR., Jacksonville, Ill., assignor, by mesne assignments, of one-half to Michael J. Hurley, St. Louis, Mo. Filed Dec. 22, 1901. Serial No. 57,816. (No model.)

Claim.—1. The combination of a pair of packing-holders, a stirrup holding said holders together, a two-armed spring provided with a central coil and having a detachable connection with the ends of the stirrup, a filarum supporting the coil of the spring and bearing loosely against the upper packing-holder, and means holding the filarum against movement.

2. The combination of a pair of packing-holders, a stirrup holding said holders together, a cross-arm provided with a central opening, a filarum passing through the central opening of the cross-arm, and bearing against one of the packing-holders, a two-armed spring, mounted in the filarum and the ends of said arms engaging with the ends of the stirrup.

3. The combination of a pair of packing-holders, a stirrup holding said holders together, a wedge-shaped cross-arm, provided with a central opening, and forced ends which receive the stirrup, a filarum provided with a forced head, passing through the central opening of the cross-arm, and bearing against one of the packing-holders, a two-armed spring having a central coil, mounted in the forced head of the filarum and the ends of said arms engaging with the ends of the stirrup.

4. In a dust-guard, the combination of a pair of packing-holders, packing in said holders, guide-flaps carried by said holders, inward flanges carried by said holders and adapted to bear against said lips, and means for embracing said packing-holders, substantially as described.

701,630. CURTAIN-FASTENER. ARTHUR M. SHADOK, Galveston, Ohio. Filed Oct. 2, 1901. Serial No. 57,492. (No model.)

Claim.—In a fastener of the type described, spaced plates having openings in adjacent relation to form a buttonhole having an enlarged and a contracted portion, one of the plates having a portion pressed inward to form a projection, and a spring having a coil about the said projection and having a part normally extended across the contracted portion of the buttonhole for holding the button therein, substantially as specified.

701,631. VEHICLE RUNNING-GEAR. GEORGE E. BISHOP, Detroit, Mich. Filed Mar. 21, 1902. Serial No. 100,000. (No model.)

Claim.—1. In a vehicle running-gear, the combination of a frame, the axle, springs interposed between the axle and frame and pivoted to the latter, and side springs joined at their center to the frame and coupled at their ends to the axle.

2. In a vehicle running-gear, the combination of a frame, the axle, springs interposed between the axle and frame, side springs attached at their center to the frame and at their ends to the axle, the coupling which unites one end of said springs to the axle being adjustable.

3. In a vehicle running-gear, the combination of a frame adapted to support a motor, the axle, springs interposed between the axle and frame and pivoted to the latter, side springs extending between the axle and attached to the frame, a sprocket-wheel on the rear axle, a chain extending from said wheel to the motor-shaft, and means for adjusting the rear axle to take up the slack of the sprocket-chain.

701,632. COFFEE-FILTER. KENNETH A. SHIRVIN, Artesia, Cal., administrator of Augustus F. Shirvin, deceased, assignor to Morris Zolotoroff and Samuel R. Caldwell, San Francisco, Cal. Filed Jan. 9, 1902. Serial No. 59,056. (No model.)

Claim.—For use in connection with a coffee-pot or the like, a filter having perforated sides and bottom walls, spring yielding arms extended upward from opposite sides of the filter, each arm consisting of a single length of wire bent to form two members which at the upper portion are curved outward and then inward, and downward extensions on said arms forming legs to support the filter upon the bottom of the pot, substantially as specified.

701,633. DIFFERENTIAL GEARING. ROBERT C. SHALL, New York, N. Y. Filed Dec. 20, 1901. Serial No. 57,861. (No model.)

Claim.—1. A rotary vehicle-axle; a disk provided on its opposite faces with clutch devices keyed to said axle; gears of different diameter mounted at opposite sides of said disk and adapted to be separately but not simultaneously engaged by the clutch devices thereof, and means for moving said gears into and out of such engagement, substantially as described.

2. A disk provided on its opposite faces with clutch devices and mounted upon the shaft of a vehicle; opposite faces with clutch devices, mounted thereon; gears of different diameter mounted at opposite sides of said disk and adapted to be separately engaged by the clutch devices thereof, and means for moving said gears into and out of such engagement, substantially as described.

3. A vehicle-axle, a disk provided on the opposite faces with clutch devices, mounted thereon; oppositely-arranged sprocket-wheels of different diameter adapted to be separately engaged by the clutch devices of said disk; levers and arms adapted to move said sprocket-wheels into and out of such engagement, and means for locking the disengaged sprocket out of position, substantially as described.

4. A clutch device comprising a disk having on its opposite faces inclined sectoral wings; a large and a small sprocket-wheel mounted at opposite sides of said clutch and provided with projecting sectoral wings adapted to enter the space between the wings of said clutch; a shifting lever controlling each of said sprocket-wheels and an operating-lever controlling said shifting lever, substantially as described.

5. A clutch device; a large and a small sprocket-wheel adapted to be separately engaged therewith; a shifting lever from each of said sprocket-wheels terminating in angular arms, and an operating-lever parallel with said arms adapted to move said shifting levers and arms, substantially as described.

6. A clutch device; a large and a small sprocket-wheel adapted to be separately engaged therewith; a shifting lever from each of said sprocket-wheels terminating in angular arms; and an operating-lever parallel with said arms and acting thereon to shift said sprockets into and out of engagement with the clutch, substantially as described.

7. A clutch device; a large and a small sprocket-wheel adapted to be separately engaged therewith; a shifting lever from each of said sprocket-wheels, terminating in horizontal arms partially inclosed in suitable bearings and provided on one face with a latch or beveled lug working in similarly-shaped recesses in said bearings, and an operating-lever having longitudinal slots through which said latches project, substantially as described.

8. A clutch device; a large and a small sprocket-wheel; a shifting lever from each of said wheels terminating in horizontal arms partially inclosed in bearings and provided on one face with a latch or beveled lug adapted to engage similarly-shaped recesses in said bearings, and an operating-lever having abrupt shoulders, and elongated slots, through the latter of which said latches are adapted to project, substantially as described.

9. A clutch device; a large and a small sprocket-wheel; a shifting lever from each wheel terminating in horizontal arms, partially inclosed in bearings and provided on their opposite faces with latches or beveled lugs adapted to engage similarly-shaped recesses in the front and rear walls of the bearings; and an operating-lever having abrupt shoulders adapted to engage the inner ends of said horizontal arms, and provided with elongated slots through which the latches on one face thereof may project, substantially as described.

701,684. REVERSING-GEAR. CHAS. F. SMITH, Broomfield, Mass., assigner, by direct and mesne assignments, to Smith Single Bolt Reversing Counter-shaft Company, Melrose, Mass., a Corporation of Maine. Filed July 12, 1901. Serial No. 63,574. (No model.)

Claim.—1. The combination with a shaft; of a pulley free to rotate on said shaft; means for clamping said pulley to said shaft; a fixed member; intermediate gears mounted thereon; external and internal gear members intermeshing with said intermediate gears; and means for connecting said external and internal gears respectively with said pulley and said shaft, as set forth.

2. The combination with the pulley loosely mounted on a shaft; of said shaft; means for connecting said pulley with and disconnecting it from said shaft; an internal gear arranged to be connected with said pulley; a pinion arranged to be connected with said shaft; a frame; one or

more gears mounted on said frame and interposed between said internal gear and said pinion; and means actuating means for connecting said external gear with said pulley and said pinion with said shaft, as set forth.

3. The combination with a shaft; of a driven pulley; a fixed frame; intermediate gears mounted thereon; other gears adapted to coast through said intermediate gears; and means for connecting said other gears respectively with the pulley and the shaft.

4. The combination with a shaft; of a driven pulley; a fixed frame; intermediate gears mounted thereon; other gears adapted to coast through said intermediate gears; a clutch member for connecting one gear to the pulley; a second clutch member for connecting the other gear to the shaft; a shifting device interposed between said clutch members; and an actuating device connected with one clutch member, as set forth.

701,685. CANDY-CUTTING MACHINE. JOHN SMITH, Philadelphia, Pa., assigner of one-half to Henry Brundin, Philadelphia, Pa. Filed Feb. 18, 1902. Serial No. 94,613. (No model.)

Claim.—1. In a candy-cutting machine, cutting-rollers, a feed-table provided with a movable feeder situated on one side of said rollers, a combined front section on said feeder, and a traveling conveyor situated on the other side of said rollers.

2. In a candy-cutting machine, cutting-rollers consisting of opposing conical knives, a feed-table provided with a movable feeder situated on one side of said rollers, a combined front section on said feeder, and a traveling conveyor situated on the other side of said rollers.

3. In a candy-cutting machine, cutting-rollers consisting of opposing conical knives, stripping-lugs situated between said knives, a feed-table provided with a movable feeder situated on one side of said rollers, a combined front section on said feeder, and a traveling conveyor situated on the other side of said rollers.

4. In a candy-cutting machine, cutting-rollers, a feed-table situated on one side thereof, a reciprocating feeder mounted upon said table, and a combined front section on said feeder.

5. In a candy-cutting machine, cutting-rollers, a feed-table situated adjacent the same, and a sliding member mounted upon said table and connected with a vibratory lever extending through an opening in said table, said sliding member being provided with a combined front section.

6. In a candy-cutting machine, a feed-table having a reciprocating feeder provided with a combined front section.

7. In a candy-cutting machine, a feed-table provided with a reciprocating feeder having its front section movably connected therewith by means of dovels and springs.

8. In a candy-cutting machine, a feed-table having a reciprocating feeder provided with a vertically-movable front section.

9. In a candy-cutting machine, a feed-table having a reciprocating feeder provided with a vertically-movable front section, and means for holding said front section under tension upon the table.

10. In a candy-cutting machine, a feed-table having a reciprocating feeder provided with a front section connected therewith by spring-binges.

11. In a candy-cutting machine, cutting-rollers, a feed-table situated on one side thereof, a traveling conveyor on the other side thereof, and means for creating an air-current through said conveyor.

12. In a candy-cutting machine, cutting-rollers, a feed-table situated upon one side thereof, a traveling conveyor situated on the other side thereof, and consisting of open-work or reticulated material, and devices for causing an air-current situated below said conveyor.

13. In a candy-cutting machine, a conveyor consisting of articulated material, devices for causing an air-current to pass through said articulated material, and means for intermittently moving the said conveyor.

14. In a candy-cutting machine, cutting-rollers geared together, a feed-table situated on one side thereof and having a movable feeder, a lever connected with said feeder and extending through an opening in said table, a traveling conveyor situated on the other side of said rollers, devices for creating an air-current situated below said traveling conveyor and actuating said means for causing an air-current.

701,686. HANGER COUPLING-BEARING FOR SKEW CONVEYERS. EDWARD G. SMITH and JOHN H. MATHER, Portland, Me., Assigners. Filed Mar. 22, 1902. Serial No. 100,408. (No model.)

Claim.—1. The combination with a power and a conveyor shaft, of a journal-stud secured to the power-shaft and extending into the conveyor-shaft, a clamping-sleeve engaging with said journal-stud and with the conveyor-shaft for connecting the latter to the power-shaft, and a bodily-movable hanger for supporting the said shafts and for operating the said shafts.

2. The combination with a power and a conveyor shaft, of a journal-stud secured to the power-shaft and extending into the conveyor-shaft, a clamping-sleeve engaging with said journal-stud and with the conveyor-shaft for connecting the latter to the power-shaft, a pair of rollers mounted on said clamping-sleeve, and a bodily-movable hanger for supporting the said shafts and engaging with said rollers for operating the said shafts.

3. The combination with a power and a conveyor shaft, of a journal-stud secured to the power-shaft and extending into the conveyor-shaft, a clamping-sleeve mounted upon said journal-stud and with the conveyor-shaft for connecting the latter to the power-shaft, a pair of rollers mounted on said clamping-sleeve, a spring for elastically connecting the clamping-sleeve to the journal-stud, and a bodily-movable hanger for supporting the said shafts and engaging with said rollers for operating the said shafts.

4. The combination with a conveyor-casing and a power and a conveyor shaft arranged therein, of a journal-stud carried by the power-shaft and adapted to extend into the conveyor-shaft, a clamping-sleeve mounted upon and engaging with the said journal-stud, a pair of rollers mounted upon said sleeve, a hanger for supporting said sleeve and arranged between the said rollers, said hanger adapted to be moved for causing the engagement and the disengagement of the conveyor-shaft with the power-shaft, and means adapted to slide upon the casing and connected to said hanger for suspending and operating the same.

5. The combination with a conveyor-casing and a power and a conveyor shaft arranged therein, of a journal-stud carried by the power-shaft and adapted to extend into the conveyor-shaft, a clamping-sleeve mounted upon and engaging with the said journal-stud, a pair of rollers mounted upon said sleeve, a hanger for supporting said sleeve and arranged between the said rollers, said hanger adapted to be moved for causing the engagement and the disengagement of the conveyor-shaft with the power-shaft, means adapted to slide upon the casing and connected to said hanger for suspending and operating the same, and a yoke for connecting the hanger to said suspending means therefor.

6. A hanger coupling-bearing for a power and a conveyor shaft consisting of a journal-stud carried by the power-shaft and adapted to extend into the conveyor-shaft, a clamping-sleeve rotating with the journal-stud and capable of longitudinal movement while revolving, said clamping-sleeve adapted to engage with the conveyor-shaft for connecting the same to the power-shaft, a vertically-extending hanger for supporting and operating said clamping-sleeve, a roller mounted on the clamping-sleeve at each side of the said hanger and engaged by the said hanger for op-

erating the clamping-sleeve, a cross-bar provided with slots to permit of a longitudinal movement, and a yoke engaging the hanger and extending through the cross-bar for connecting the hanger to the said bar.

7. In combination, a power and a conveyor shaft, clamping means for connecting said shafts together, a bodily-movable hanger for supporting said shafts and clamping means and adapted when moved to elastically operate said clamping means, and means for suspending said hanger.

8. In combination, a power and a conveyor shaft, clamping means for connecting said shafts together, a bodily-movable hanger for supporting said shafts and clamping means and adapted when moved to elastically operate said clamping means, means for suspending said hanger, a cross-bar provided with a slot in each end, and means for connecting said hanger to said cross-bar.

9. A hanger coupling-bearing for conveyor-shafts consisting of a clamping-sleeve, a bodily-movable hanger for operating and supporting said sleeve, and means for suspending and operating said hanger.

701,687. APPLIANCE FOR CLEANING FLOORS, WALLS, WINDOWS, &c. CHARLES W. SHELLER and JOHN F. ROBINSON, JR., Boston, Mass., Assigners. Filed Aug. 8, 1901. Serial No. 71,804. (No model.)

Claim.—1. In an appliance of the character described, a pair of plates, a spring connection secured to said plates for forcing them one toward the other, an absorbent material adapted to be arranged between the said plates and held in position by the action of the spring connection, and a handle connected to one of the said plates.

2. In an appliance of the character described, a pair of plates, a spring connection secured to the said plates and adapted to force one toward the other, an absorbent material arranged between said plates and retained in position by the action of said spring connection, a handle connected to one of said plates and having a portion thereof extending at an obtuse angle to the remaining portion, and a roller connected to the handle at the juncture of the angularly-disposed portion of the handle with the remaining portion thereof.

701,688. ROTARY VALVE. JAMES E. STARR, Taubet, Mich. Filed June 1, 1901. Serial No. 62,606. (No model.)

Claim.—1. A valve, comprising a casing having a steam-inlet, two cylinder-ports and two exhaust-ports leading to a common exhaust, casing-heads having cavities connected with the steam-inlet, a valve-plug mounted to turn in the casing and having exhaust-cavities adapted to register with the exhaust-ports and cylinder-ports, a main inlet-rod having branch ports registering at all times with the casing-head cavities, said main inlet-rod being adapted to register with either of said cylinder-ports, as set forth.

2. A valve, comprising a casing having heads, a valve-plug mounted to turn in said casing and having its stem extending through said heads, ball-bearings in said heads for said valve-stem, and means for adjusting said heads on the casing, to bring the ball-bearings and the valve-plug in proper alignment with the central portion of the casing.

3. A valve, comprising a cylindrical member provided with open ends, a pair of heads provided with ball-bearings for clamping said ends, a movable shaft passing through said ball-bearings and provided with a valve-plug, means for adjusting the position of said heads relative to said cylindrical member, said valve-plug being provided with integral surface clamping said ball-bearings.

4. A valve, comprising a cylindrical body provided with open ends, heads mounted upon the ends thereof and provided with annular outer members of ball-bearings, means for adjusting the position of said heads

relative to said cylindrical body, a valve-pipe fitted steam-tight in said cylindrical body and mounted upon a revolvable stem passing through said head, said stem being provided with inner members of ball bearings.

701,689. HAT-GUARD. ABNEY STARR, New York, N. Y. Filed Mar. 12, 1902. Serial No. 97,980. (No model.)

Claim.—1. A hat-guard, consisting of a cord, a flat pointed pin attached to one end of said cord, and a clamping device attached to the opposite end of the cord and provided with a V-shaped hook for engaging with the cord, substantially as set forth.

2. A hat-guard, consisting of a cord of proper length, a flat pointed pin provided with an opening and attached to one end of the cord, and a clamping device provided with two openings or eyes for attachment with the opposite end of the cord, said clamping device being provided with a V-shaped hook at one end, substantially as set forth.

701,640. SOLID-DIE RIVET-MACHINE. MARTIN T. STANUP-LAND, Cleveland, Ohio. Filed Nov. 12, 1901. Serial No. 98,148. (No model.)

Claim.—1. In a machine for the purpose described, the combination with a rotary die-head a spring-actuated hook arranged to engage said die-head, and a reciprocating plunger and heading-tool, of means for operatively connecting the reciprocating plunger with the hook, comprising a vertically-reciprocating bar to which the hook is pivoted, a roller on the plunger, a rock-shaft in the bed-plate, a rock-arm on said shaft, a link connecting said rock-arm and vertical bar, a cam-shaped arm on the rock-shaft arranged to engage the said roller on the plunger and a spring-actuated arm on the rock-shaft, substantially as described.

2. An actuating device for the rotary heading-die, comprising a spring-actuated hook arranged to engage the periphery of the die-head at regular intervals, in combination with means for actuating said hook to rotate said head at regular intervals, consisting of a plunger, a cam-arm engaging said plunger, a rock-shaft on which said cam-arm is mounted, a rock-arm on said shaft, a vertical bar to which said hook is pivoted, and a link connecting said bar and rock-arm, and a return-spring for the rock-shaft, substantially as described.

3. In a solid-die machine for heading-blanks, the combination with a rotary die-head, a reciprocating heading-tool and crank and crank-shaft

thereof, of means for ejecting the finished blank or product, consisting of a spring-actuated pin, a pivoted arm arranged to engage said pin and withdraw it from the die-head, and operatively connected with the crank-shaft, and means for releasing the said arm from engagement with the pin when the pin has been withdrawn to its greatest extent, substantially as described.

4. In combination with the die-head, and actuating crank-shaft, of a solid-die machine, means for discharging the perforated blank from the head, consisting of a spring-actuated pin, a roller on said pin, a pivoted arm engaging said roller, a link connecting said arm with a pin upon the crank-shaft, and means for releasing said arm when the pin has been withdrawn from the head, consisting of a roller-disk pivoted in the path of the arm, substantially as described.

701,641. ADJUSTING DEVICE FOR SEEDERS. WILLIAM STEPHENSON, St. Louis Park, Minn. Filed Mar. 12, 1901. Serial No. 98,100. (No model.)

Claim.—1. In a seeder, the combination, with the feed-cylinders and the adjustable rod, of a lever pivotedly connected to said rod, means arranged to take up lost motion between said lever and said rod, an indicating-scale, pointers carried by said lever and co-operating with said scale, and an adjusting-screw connected to said lever, for the purpose set forth.

2. In a seeder, the combination, with the feed-cylinders and the adjustable rod, of a lever pivotedly connected to said rod, and a spring arranged to take up lost motion between said lever and said rod, for the purpose set forth.

3. In a seeder, the combination, with the feed-cylinders and the adjustable rod, of a lever pivotedly connected to said rod, and mounted upon a stationary support, an adjusting-screw for said lever, and a spring arranged to take up lost motion between said lever and said rod, and between said lever and its adjusting-screw, for the purpose set forth.

4. In a seeder, the combination, with the feed-cylinders and the adjustable rod, of a lever pivotedly connected to said rod, a stationary support upon which said lever is mounted, an adjusting-screw mounted in a fixed support and having a threaded connection with said lever, and a spring engaging the pivotal connection of said lever and said rod, the support upon which said lever is mounted, and the connecting device between said screw and said lever, for the purpose set forth.

5. In a seeder, the combination, with the feed-cylinders and the adjustable rod 2, of a lever 3 pivotedly connected to said rod, an indicating-scale, pointers carried by said lever and co-operating with said scale, an adjusting-screw connected to said lever, and a spring arranged to take up lost motion between said lever and said screw and between said lever and its connection with said rod, for the purpose set forth.

6. In a seeder, the combination, with the feed-cylinders and the adjustable rod, of an adjusting-lever, a connection between said lever and said rod, and an adjustable cam forming part of said connection, for the purpose set forth.

7. In a seeder, the combination, with the cylinders and the adjustable rod 2, of the operating-lever 3, the short shaft 17 connected to said lever and having the cam 23 formed integrally therewith, and the co-operating cam 21, substantially as described.

8. In a seeder, the combination, with the feed-cylinders and the adjustable rod 2, of an adjusting-lever, a shaft or rod 17 connecting said lever with said adjustable rod, and an adjustable cam arranged in connection with said rod or shaft 17, substantially as described.

9. In a seeder, the combination, with the cylinders and the adjustable rod 2, of the lever 3, the cam 21 and 23 arranged upon said rod, one of said cams being co-operated with said lever 3, the conical washers arranged upon said rod and engaging said cams, and means permitting one of said cams to be turned upon the other, for the purpose set forth.

10. In a seeder, the combination, with the short shaft 17 and the cam 23 formed integrally therewith, of a co-operating cam 21 the rod 2

and the bolt 31) adapted to prevent accidental rotation of said cone, for the purpose specified.

11. The combination, with the feed-cylinders and the adjustable rod, of a lever pivotedly connected to said rod, and means arranged to take up lost motion between said lever and said rod.

701,642. SEEDER. WILLIAM STEPHENSON, St. Louis Park, Minn. Filed Nov. 9, 1901. Serial No. 98,092. (No model.)

Claim.—1. In a seeder, the combination, with the angle-bar frame provided with holes in its vertical flanges at the ends of the frame, of axle-spindles fitting within said holes and provided with vertical and horizontal flanges adapted to be connected to the corresponding flanges of said frame, substantially as described.

2. In a seeder, the combination, with an angle-bar frame, of brackets at the ends thereof, a hopper supported on said brackets, axle-spindles projecting through holes in the vertical flanges of said frame beneath said brackets and provided with vertical and horizontal ears or flanges, and bolts securing the flanges of said spindles to the corresponding flanges of said frame the bolts that pass through the horizontal flanges also securing said brackets thereto, substantially as described.

3. The combination, with an axle-spindle, of a wheel-hub having a gear secured thereon, a feed-shaft provided with a gear, a lever loosely mounted on said feed-shaft, on this gear carried by said lever and adapted to engage said axle and said feed-gear, and means for oscillating said lever to raise said idle gear out of engagement with said axle-gear or move it into contact therewith, substantially as described.

4. The combination, with a driving-gear 22, of a feed-shaft 24, a gear 25 having a hub 26 secured on said shaft, a lever 28 having a sleeve 27 loosely mounted on said hub and also having a stud 30, a gear 31 loosely mounted on said stud and normally engaging said gear 25, and means for oscillating said lever 28 to move said gear 31 into or out of engagement with said driving-gear, substantially as described.

5. The combination, with a driving-gear 22, of the feed-shaft 24, a gear secured thereon, a lever 28 oscillating on said shaft as a center and having an offset rear mid shaft and provided with a stud 30, a wide-faced gear loosely mounted on said stud and normally engaging said gear 25, and means for oscillating said lever, substantially as described.

6. The combination, with an axle-spindle, of a wheel-hub having a gear secured thereon, a feed-shaft provided with a gear, a lever loosely mounted on said feed-shaft, on this gear carried by said lever and adapted to engage said axle and said feed-gear, a rock-shaft, a crank-disk thereon and a yielding connection provided between said crank-disk and said lever, substantially as described.

7. In a seeder, the combination, with a driving-gear, of a feed-shaft, a gear secured thereon, an oscillating lever centered on said feed-shaft, an idle gear carried by said lever and adapted to engage said driving-gear and said feed-shaft gear, a rock-shaft, a crank thereon, a rod connected with said crank and with said lever, and a spring provided between said lever and said crank, substantially as described.

8. In a seeder, the combination, with an angle-bar frame provided with holes in its vertical flanges, of axle-spindles fitting within said holes, and means for adjustably securing said spindles to the flanges of said frame to permit the angle of the wheels with respect to the hopper and frame to be changed.

9. In a seeder, the combination, with a frame provided with holes at the ends thereof, of axle-spindles fitting within said holes, and means for changing the angle of said spindles with respect to said frame, for the purpose specified.

10. In a seeder, the combination, with a wheel-hub having a gear, of a feed-shaft provided with a gear and located above said wheel-hub gear, an oil-tube, a lever provided with a sleeve loosely mounted on the hub of said feed-gear and having a hole communicating with said oil-tube, and an idle gear carried by said lever and adapted to engage said wheel-hub gear and said feed-gear.

11. The combination, in a seeder, of the bracket 13 provided with an oil-tube 31, a feed-shaft below said oil-tube, a gear having a hub slidable on said shaft, a lever having a sleeve adapted to rotate on said hub, said hub and sleeve having oil-holes registering with the discharge end of said oil-tube, a driving-gear, and an idle gear provided on said lever and adapted to engage said driving-gear and said feed-gear.

12. In a seeder, the combination, with the frame and the wheels supporting the same, of a driving-gear provided on one of the wheel-hubs, a feed-shaft above said driving-wheel, a feed-gear having a hub slidable on said shaft, a lever provided with a sleeve loosely mounted on said hub, an idle gear slidably supported on said lever and adapted to engage said driving-gear and said feed-gear, and a guard 27 provided over said feed and idle gears and between them and said wheel and limiting their outward sliding movement, substantially as described and for the purpose specified.

13. The combination, with an axle-spindle, of the wheel-hub provided with a gear, a feed-shaft also having a gear, a lever loosely mounted on said feed-shaft, a gear mounted on said lever and adapted to engage said axle and said feed-shaft gear, a rock-shaft, and a yielding connection provided between said lever and said rock-shaft.

701,643. PEN-POINT-ERECTING PENCILHOLDER. EMERY C. STURM, Pittsburg, Pa. Filed Apr. 1, 1902. Serial No. 100,000. (No model.)

Claim.—A pencilholder comprising a pair of resilient members united at their rear ends, an inwardly-projecting jaw formed integral with the opposite end of each member, one of said jaws provided on its inner face with a series of semicircular recesses arranged out of alignment with each other, the other member provided with corresponding semicircular projections whereby a pen can be held in different positions, and a sleeve slidably mounted on the said holder, substantially as described.

701,644. KITE OR FLYING-MACHINE. VICTOR TARNAL, Budapest, Austria-Hungary. Filed May 12, 1901. Serial No. 98,064. (No model.)

Claim.—1. In a kite or flying-machine the combination of a series of horizontal surfaces disposed in different planes each plane being in advance of the one below it and a series of symmetrically-disposed partition-walls mounted vertically between the said horizontal surfaces, substantially as described.

2. In a kite or flying-machine, the combination of a series of horizontally-disposed surfaces mounted in different planes each plane being in advance of the one below it and a series of symmetrically-disposed vertical partition-walls in open connection with the said horizontal surfaces in the manner and for the purpose substantially as described.

3. In a kite or flying-machine the combination of a series of horizontal surfaces disposed in different horizontal planes and a series of vertically-disposed partition-walls mounted between the same in different vertical planes all parallel to the direction of motion of the kite and symmetrically arranged in the manner and for the purpose substantially as described.

4. In a kite or flying-machine, the combination of a series of horizontally-disposed surfaces mounted stepwise one over the other and a vertically-disposed partition-wall all parallel to the direction of motion of the kite to connect the same in the manner and for the purpose substantially as described.

701,645. DEVICE FOR LOADING COKE-SHOVELS. WILLIAM A. TRA, Bellevue, Ohio; Mary J. Tra administratrix of said William A. Tra deceased. Filed Aug. 2, 1901. Serial No. 70,696. (No model.)

Claim.—1. A portable elevator of the class described, comprising an inclined frame, a wheeled axle, an elevator-car having members disposed at an angle to each other and arranged for the front member thereof to travel on said inclined frame, the rear member of said car being adapted to assume a horizontal position when the car is lowered to the rear portion of the inclined frame, and a hoisting mechanism driven from the axle and having operative connection with the elevator-car.

2. An elevating device for checks, consisting of a wheel-supported frame having inclined channels upon its lower face, the body portion of the frame being inclined downward and forward, and its upper portion curved downward and forward, a car or platform having wheels arranged to enter the said channels, a winding mechanism mounted on the axle of the wheel-supported frame, a locking connection between the winding mechanism and the axle, a shifting device for the winding mechanism, and a flexible connection between the car or platform and the winding device, as and for the purpose described.

3. In an elevating device for checks, the combination, with a wheel-supported frame having a body inclined downward and rearward and upwardly and downwardly curved upper portion, the side bars of which frame have longitudinal channels produced therein, closed at their ends, the channels extending practically from one terminal of a side bar of the frame to the other, an axle connected with the said frame, and supporting wheels secured upon the said axle, of a spring-controlled winding-drum mounted to slide upon and to turn with the axle, engaging projections from the axle and the said drum, a shifting-lever engaging with the said drum and arranged to carry it from operative connection with the axle, a car or platform having friction-wheels at its sides which enter the channels in the said frame, a flexible connection between the winding-drum and the car or platform, roller-guides for such connection, and a section forming a portion of the car or platform, adapted to stand at an angle thereto and prevent the checks from leaving the platform as it is carried up the inclined plane of the frame, as described.

4. In an elevating device for checks, the combination, with a frame the body portion of which is inclined downwardly and forwardly, the upper portion being downwardly and forwardly curved, the side sections of the frame having longitudinal channels produced therein, closed at their ends, an axle supported in bearings carried by the said frame, supporting-wheels secured to the said axle, and an adjustable draft device connected

with the axle and frame, of a drum mounted to turn and slide on the axle, the drum being provided with projections at one end adapted to meet extensions from the axle and a spring which acts to carry the said points in engagement, a shifting-lever connected with the said drum, adapted to compress the spring and carry said points out of engagement, a car or platform having rolling extensions adapted to enter the channels of the frame, a flexible connection between the platform and the said frame, guides for the said flexible connection, and an adjustable rear section for the car or platform, which adjustable section comprises a retaining member and a locking member for the retaining member, all combined for operation substantially as shown and described.

5. In a portable elevator of the class described, an elevator-car comprising members disposed at an angle to each other, a supplementary member having hinged connection with one car member, and means for locking the supplementary member in inclined relation to the car member, combined with an inclined frame, and a hoisting mechanism for hauling the car on said frame, substantially as described.

701,646. DOUGH-HOLDING MACHINE. CHARLES A. TROMBEE, Bellevue, N. J. Filed Apr. 17, 1901. Serial No. 66,529. (No model.)

Claim.—1. The improved dough-molding machine comprising devices which form dough into a sheet and roll the said sheet completely into a spiral form, and mechanism into which each spiral roll is dropped and by which it is kneaded to form a mass suitable for the oven, the two operations of spiral rolling and kneading being thus effected separately and successively, as and for the purpose specified.

2. In a dough-molding machine, the combination, with reducing-rolls, whereby dough is formed into a sheet, of a roller arranged in the path of the dough sheet as it leaves said rolls, and means for rotating it, its upper side then moving in a direction opposed to the travel of the sheet, to form the latter into a spiral roll, and a guide-plate for delivering the sheet to each roller, substantially as shown and described.

3. A dough-molding machine comprising rollers for forming the dough into a sheet, means arranged below the rollers and fixed in position for rolling up the dough sheet spirally, and the dough-kneading apparatus having its mouth adjacent to and below the spiral roll-former, all substantially as shown and described.

4. A dough-molding machine having spaced sets of reversible rollers, of which one roller of each set has annular flanges, the other roller of the set extending between said annular flanges, to form a passage between the rollers of a set, the passage for the sets of rollers being of different lengths, and means for adjusting the non-flanged rollers toward the flanged rollers to vary the distance between the rollers of a set, as set forth.

5. In a dough-molding machine, the combination with a toothed roller rotating in a direction opposite to the travel of the dough, a smooth roller arranged adjacent to and above said toothed roller, and a fixed inclined guide arranged in the chute above the smooth roller, and having its lower end curved over and downward adjacent to the smooth roller, substantially as shown and described.

6. A dough-molding machine having a rolling-up device for rolling a dough sheet into a spiral roll, comprising a toothed roller and a smooth roller, the rollers rotating in opposite directions, as set forth.

7. A dough-molding machine having a rolling-up device for rolling a dough sheet into a spiral roll, comprising a toothed roller and a smooth roller, the rollers rotating in opposite directions, and a fixed apron or table extending to the top surface of the smooth roller and terminating a distance from one side of the toothed roller, as set forth.

8. A dough-molding machine having a rolling-up device for rolling a dough sheet into a spiral roll, comprising a pair of rollers of different size and rotating in opposite directions, the larger roller forming a step for the forward end of the dough sheet, and a fixed inclined guide for guiding the dough sheet over the smaller roller against the abutment or step-roller, as set forth.

9. A dough-molding machine having a pressing and rolling device, comprising a revolvable drum or cylinder having a peripheral covering of a fabric material, a shield external to and spaced from the peripheral surface of said cylinder, for pressing and rolling a roll of dough, and means for adjusting the shield toward or from said cylinder, said means comprising levers for engaging the shield at or near the ends thereof, and a connection engaging the shield at or near the middle thereof and actuated from said levers, as set forth.

10. A dough-molding machine having a pressing and rolling device, comprising a revolvable drum or cylinder having a peripheral covering of a fabric material, a shield external to and spaced from the peripheral surface of said cylinder, for pressing and rolling a roll of dough, means for adjusting the shield toward or from said cylinder, said means comprising levers for engaging the shield at or near the ends thereof, a connection engaging the shield at or near the middle thereof and actuated from said levers, and means for simultaneously moving said levers, as set forth.

11. A dough-molding machine, provided with a drum or cylinder having flanges, auxiliary flanges adapted to fit against said drum or cylinder flanges at the inside thereof, and means for supporting said auxiliary flanges independent of the drum, as set forth.

701,647. ELSTORICAL APPARATUS. ALFRED TRAUT, Neuchâtel, Switzerland, assignor to David Perret, Neuchâtel, Switzerland. Filed Feb. 18, 1902. Serial No. 94,817. (No model.)

Claim.—In a testing apparatus for electric circuits, an electromagnetic generator comprising an exterior casing, an electromagnet in said casing, a spring, an armature mounted on said spring in proximity to the poles of said magnet, a pin carried by said spring, an operating pusher provided with an inclined end portion and a recess above the same for said pin, and means guiding said pusher-red in the path of said pin, substantially as set forth.

701,648. TALKING-MACHINE. LOUIS P. VALMONT, New York, N. Y., assignor, by mesne assignments, to the Universal Talking Machine Manufacturing Company, a Corporation of New York. Filed June 3, 1900. Serial No. 718,769. (No model.)

Claim.—1. The combination of the record-rotating mechanism, a plate shaped like the frustum of a cone, with a web of material extend-

ing across the smaller end forming a flat central portion, and having a sound-record formed upon the curved surface thereof, and the reproducer adapted to move along a line parallel to an element of said curved surface.

2. The combination of a record-rotating mechanism having a rotating shaft inclined to the plane of the horizon, a plate shaped like the frustum of a cone having a sound-record formed in a helical line upon the exterior curved surface thereof, the angle of the cone from which the frustum is cut being equal to the angle of inclination of the rotating shaft to the horizontal plane, said plate being carried and rotated by said shaft, and the reproducer adapted to move in a horizontal line substantially parallel to an element of the curved surface of said frustum.

3. A conically-shaped turn-table for talking-machines adapted to conically-shaped records, having that portion of the table over which the stylus travels on a substantially horizontal plane, and a rotating spindle disposed at an angle to the line of the record-surface, and means for causing the conically-shaped record upon the turn-table, substantially as described.

701,649. TALKING-MACHINE. LOUIS P. VALMONT, New York, N. Y., assignor, by mesne assignments, to the Universal Talking Machine Manufacturing Company, a Corporation of New York. Original application filed June 3, 1900, Serial No. 718,769. Divided and this application filed Nov. 16, 1901. Serial No. 82,604. (No model.)

Claim.—1. As an article of manufacture, a sound-record in the shape of a frustum of a cone with a web of material extending across the smaller end forming a flat central portion, the record-grooves being formed in the curved surface of said frustum.

2. As an article of manufacture, a sound-record in the shape of a frustum of a cone, with a web of material extending across the smaller end forming a flat central portion, the record-grooves being formed in the curved surface of said frustum in a helical line about the axis of said frustum.

3. As an article of manufacture, a dish-shaped sound-record having record-grooves formed on the outer curved surface of the cone-shaped portion.

701,650. MANUFACTURE OF CALCIUM CARBIDE. DOMINIQUE DE VALATTE and JULIEN D'OLANOWSKI, Paris, France. Filed Dec. 12, 1900. Serial No. 82,897. (No specimens.)

Claim.—The process herein described of making a mixture of calcium carbide and a hydrocarbon, which consists in bringing a mass of lime in a molten state free from carbon into intimate contact with a liquid hydrocarbon, and permitting the same to cool in contact therewith, substantially as set forth.

701,651. ELECTRICAL SHIP-LOG APPARATUS. THOMAS F. WALKER and THOMAS S. WALKER, Birmingham, England. Filed Sept. 2, 1901. Serial No. 74,966. (No model.)

Claim.—1. In a ship's log, the combination with a train of wheelwork, a rotator and connections between the wheelwork and rotator, of an intermittently-operating circuit-closer, a contact-piece co-operating therewith, means operated by the wheelwork for rotating the said circuit-closer, a detent, a spring engaging therewith, a toothed wheel, a stop carried by said means and pins on the said wheel co-operating with the said detent, a register mechanism, and means for conveying electrical impulses to said mechanism.

2. In a ship's log; a train of wheelwork ending in a primary spindle and tooth-wheel, a rotator to actuate said train, a spring-containing barrel, a contact circuit-closer mounted on said barrel, a spring connecting said primary spindle and barrel, means on said tooth-wheel restricting the relative movement of barrel and tooth-wheel, means for adjusting the tension of said spring, a detent device co-operating with said spring-impelled barrel and means for conveying to and from the ends of a circuit and through said circuit-closer impulses of electrical energy.

3. In a ship's log; a register actuated by impulses of electrical energy, an electric circuit, an insulated spring contact-piece forming one terminal pole of the circuit, an intermittently-rotating circuit-closer, a terminal pole for the opposite end of the circuit electrically connected to said circuit-closer, a barrel carrying said closer, a spindle revolving within said barrel, a coiled spring connected by its opposite ends to the said barrel and spindle, a toothed member of train of motive wheel-work and means for alternately restraining and permitting the rotation of said spring-impelled barrel in co-operation with a detent.

4. An electric circuit, an insulated spring contact-piece, a contact-closer, a spring-impelled barrel carrying said closer, an axle therefor, a gear-wheel and train of impelling mechanism, means limiting the relative rotation of barrel and gear-wheel, and detent devices for successively restraining revolution of the barrel and circuit-closer and permitting of rapid rotatory flight, substantially as set forth.

5. An open electric circuit, an insulated spring contact-piece forming one pole of the circuit, a source of electrical energy in said circuit and mechanical motive mechanism in electrical connection with the opposite pole of the circuit, a relative intermittently-conducting circuit-closer, an axle common to the barrel and to the terminal member of a motive train of rotative mechanism and a spring connecting the barrel and terminal member referred to, in combination with a detent device and stops on the barrel and terminal member of the motive train.

6. In a ship's log, a circuit-closer periodically rotating in unison with a member of a train of wheelwork, a contact-piece co-operating therewith, a spring, a barrel and a motor-axle to which opposite ends of the spring are connected, said barrel carrying said circuit-closer, a detent, a spring engaging the same, a stop on said barrel, a toothed wheel, a pin on said wheel, and means for conveying electrical impulses to a register mechanism.

7. In an electrical ship-log mechanism, a continuously-rotating member, an intermittently-operating member, a spring connecting the two members together and operated by the continuously-rotating member for suitably operating the intermittently-operating member, a circuit-closer

fixed to the said intermittently-operating member, a contact co-operating with said closer for opening and closing an electrical circuit, and detent devices for successively restraining the operation of the intermittently-operating circuit-closer and permitting the rapid rotatory flight thereof.

701,652. FOLDING BOX. LAIDA B. WEBB, Whippany, N. J., assignor to Webb Folding Box Company, Newark, N. J., a Corporation of New Jersey. Filed Apr. 17, 1901. Renewed Jan. 22, 1902. Serial No. 90,921. (No model.)

Claim.—1. As an improved article of manufacture, a folding box comprising a bottom portion, and pieces projecting from two edges of the bottom portion, and side pieces projecting from the two remaining edges of the bottom portion, the side pieces having end flaps adapted to fold inward and form the box ends, one set of flaps having extensions projecting from the upper edge, which extensions are split at right angles to the length of the flaps, and the second set of flaps being cut away on the inner or under side to form terminal tongues to engage the apices in the first flaps, the second flaps being also provided with extension-flaps along their outer and upper edges, which extension-flaps are adapted to fold inward into the formed box, together with the split flaps above named, the combined extensions of the two sets of flaps forming a lock to prevent the disengagement of the parts of the box ends.

2. In a folding box, the combination with the box-bottom and the side pieces projecting from opposite edges of the bottom, of the end flaps on the side pieces, said flaps being adapted to fold inward to form the box ends and being each provided with extensions adapted to fold inward into the formed box, one set of flaps having also tongues formed on their under or inner edges, and the second set of flaps having tongues projecting from their outer edges at points above the normal top line of the formed box by which arrangement the tongues of the first flaps engage with the tongues of the extensions of the second flaps so that the said tongues may be pushed downward behind the body portion of the second flaps and the extensions of the two sets of flaps folded inward together to form a lock.

701,653. CLIPPER. ROBERT F. WERN, New Orleans, La. Filed Jan. 24, 1900. Serial No. 2,619. (No model.)

Claim.—1. A clipper for cordage, comprising two tubes fitted the one within the other and relatively turnable, each tube having a knife or knives thereon working as described, and one of the tubes being made up of a number of separable bars, with means for holding said bars in tubular form.

2. In a clipper for cordage, the combination with a support, of a tube held rigidly thereby and having a knife or knives thereon, a second tube formed with a number of separable bars, each with a knife thereon, and means for holding said bars rigidly in tubular form to turn around the first-named tube.

3. In a clipper for cordage, the combination with a tube fixedly held and provided with knives, of a second tube mounted on the first tube to

revolve thereon, and consisting of a series of separable bars formed with knives, and collars surrounding the said bars and having screw-threaded engagement with each other, substantially as described.

4. In a clipper for cordage, the combination with a support, and a tube having one end secured to the support and provided with knives at its other end, of a second tube mounted to revolve on the first tube and consisting of a series of bars having knives at their ends, said bars having oppositely-beveled outer surfaces, collars surrounding the bars and having a screw-threaded engagement with each other, and means for locking the collars in place, substantially as described.

5. In a clipper for cordage, the combination with a support, a tube having one end secured to the support and provided with knives at its other end and with an annular external flange between its ends, of a second tube mounted on the first tube to revolve thereon and consisting of a series of bars having knives at their ends, said bars having oppositely-beveled outer surfaces, and having their inner ends abutting against the flange of the first tube, collars surrounding the bars and having a screw-threaded engagement with each other, a ring surrounding the first tube between its flange and the support, and a screw securing one of the collars to the ring, substantially as described.

701,654. GRAPPLE-HOOK. DAVID WHITE, Kentwood, La., assignor of one-half to George A. Lomon, Kentwood, La. Filed Nov. 27, 1901. Serial No. 82,947. (No model.)

Claim.—1. In a grapple-hook, the combination with the spring-operated pivoted hooks, of a tripping-bar for holding said hooks open, and a trigger suspended from said tripping-bar for tripping the same.

2. In a grapple-hook, the combination with the spring-operated pivoted hooks, of a tripping-bar for holding said hooks open, and a pivoted rod or trigger suspended from said bar for tripping the same.

3. In a grapple-hook, the combination with the spring-operated pivoted hooks, of a tripping-bar for holding said hooks in their open position, and a trigger for tripping said bar pivotally suspended transversely thereof, the said trigger being provided with a lower pivoted section, capable of a longitudinal swing in respect of said bar.

4. In a grapple-hook, the combination with the spring-operated pivoted hooks, of a tripping-bar for holding said hooks in a predetermined open position and means for adjusting the length of said tripping-bar.

5. In a grapple-hook, the combination with the spring-operated pivoted hooks, of a tripping-bar for holding said hooks in an open position, comprising a plurality of sections, and means for adjusting said sections for shortening or lengthening the tripping-bar.

6. In a grapple-hook, the combination with the spring-operated pivoted jaws, of an adjustable tripping-bar for holding said hooks in a

predetermined open position, and means suspended from said bar for tripping the same.

7. In a grapple-hook, the combination with a pair of shanks pivoted together midway of their length, and having hooks at one end, and means for opening the other ends and closing said hooks; of a bar pivoted to one of said shanks and adapted to hold said hooks open, means for adjusting the length of said bar, and means for tripping said bar to allow said hooks to close, substantially as described.

8. In a grapple-hook, the combination with a pair of shanks pivoted together midway of their length, and having hooks at one end, and means for opening the other ends, and closing said hooks; of a bar pivoted to one of said shanks and adapted to hold said hooks open, means for adjusting the length of said bar, and a tripping-arm for raising said bar to allow said hooks to close, substantially as described.

9. In a grapple-hook, the combination with a pair of shanks pivoted together midway of their length, and having hooks at one end, rollers in the other end, and a triangular frame engaging said rollers and adapted to open one end of said shanks and close the said hooks; of a bar for holding said hooks open and means for tripping said bar to allow the hooks to close, substantially as described.

10. In a grapple-hook, the combination with a pair of shanks pivoted together midway of their length, and having hooks at one end, and rollers in the other end; of a triangular frame engaging said rollers and adapted to open one end of said shanks and close the said hooks, and a rope connected with the apex of said triangular frame for lifting said device, substantially as described.

11. In a grapple-hook, the combination with a pair of shanks pivoted together midway of their length and having hooks at one end and rollers in the other end, and a pulley mounted near the pivotal points of the said shanks; of a triangular frame engaging said rollers and adapted to open and close one end of said shanks, a rope attached to the apex of the triangular frame for lifting the device and for moving the triangular frame in the direction to close the said hooks, and a rope connected with the base of said triangular frame and passing over said pulley for moving said frame in the direction for closing the said hooks, substantially as described.

12. In a grapple-hook, the combination with a pair of shanks pivoted together midway of their length and having hooks on one end and weights near their pivotal points, of means for opening and closing said hooks, a bar pivoted to one shank and adapted to engage the other shank to hold said hooks open, and means for tripping said bar to allow said hooks to close, substantially as described.

701,655. HOLDER ON FILE FOR PAPER, LUTHERA & MICHAEL J. WISNIEWSKI, Portau, Pa., assignor of one-half to Irvin T. Burdette, Portau, Pa. Filed Jan. 31, 1902. Serial No. 91,929. (No model.)

Claim.—1. In a holder of the character stated, a shank, a bill formed of a plurality of members extending upwardly from the lower end thereof, and a plurality of resilient arms depending from the upper end thereof, said arms being adapted to press toward the inner sides of the portions of the bill below the top loop thereof and being on opposite sides of the exterior of said loop.

2. In a holder, a shank, a bill and an arm connected with the opposite ends of said shank, and an eye on said shank formed of expansible portions of said shank.

3. In a holder of the character stated, a bill, an arm, a shank, the latter carrying said bill and arm and formed of a plurality of pieces and an eye in said shank formed of portions of said pieces and open at one end, whereby it may be sprung upon a sustaining device.

4. In a holder of the character stated, a bill, an arm and a shank the latter carrying said bill and arm and having eyes at its upper and lower ends, one of said eyes having resilient sides whereby it may be sprung upon a sustaining device.

5. In a holder of the character stated, a bill, an arm, and a shank, the latter carrying said bill and arm, and an eye on said shank, said shank being bowed outwardly transverse to its length.

701,656. TANK-CAR. CLARENCE L. WILSON, PRINCETON, Pa. Filed Mar. 22, 1901. Serial No. 53,269. (No model.)

Claim.—1. A tank-car having a longitudinal cylindrical tank formed of one or more longitudinal plates with enlarged longitudinal edge portions secured together by locking-bars compressed upon said edge portions, said tank having flanged end heads secured by rivets extending through the flanges, said flanges being bent to allow the passage of the locking-bars; substantially as described.

2. A cylindrical tank formed of one or more longitudinal plates with enlarged edge portions secured together by locking-bars compressed thereon, said tank having a flanged end head secured by rivets extending through the flanges, said flanges being bent to allow the passage of the locking-bar; substantially as described.

701,657. BUMP-HOLDER. ANTONIA L. WILSON, CHAMBERS CITY, Pa. Filed Aug. 21, 1901. Serial No. 73,948. (No model.)

Claim.—1. A mop-handle, having a split spring-ring embracing two intermediate portions thereof, with its middle portion fastened to one side of the handle and its opposite free ends overlapped and spaced from the opposite side of the handle to receive and embrace a mop-rag.

2. The combination with a handle, of a brush-holder having its forward edge secured to the outer edge of the handle and provided with one or more laterally-projected spring-clips, and an opposite intermediate spring-clip bent from the holder and folded back upon itself to form a handle-engaging brace.

3. A brush-holder consisting of a flat metal plate having lateral fastenings projected from the outer edge portion of the back of the body, spring-clips bent laterally from the forward edge of the body, and an opposite spring-clip bent laterally forward from the intermediate portion of the rear edge of the body, said clip being bent back upon itself and inclined across the back of the body, the outer free end of the clip being forked.

4. The combination with a handle, having a mop-holder at one end

which embodies a stationary transverse member, of a brush-holder having its outer edge lying against the fixed member, and provided with fastenings connecting the brush-holder to said fixed member, spring-clips carried by the opposite front and rear edges of the body and projected at the front thereof, and a brace extending between the rear portion of the holder and the handle of the mop.

701,658. SAMPLE CASE AND EXHIBITOR. SAMUEL H. WIT-
OLD, MARION, IOWA. Filed Feb. 6, 1908. Serial No. 62,764. (No model.)

Claim.—1. A sample case and exhibitor, comprising a case proper formed in two hingedly-connected sections, one of said sections having a stud or pin on its free end, and a series of tray-shaped sections hingedly connected together so as to be capable of folding into the case when the case is closed, said sections also being capable of being extended into line with each other and resting jointly against one section of the case proper and against the said stud or pin whereby to hold the tray-shaped sections in position for displaying their contents.

2. A sample case and exhibitor, comprising three tray-shaped sections, hinges having laterally-offset portions connecting two of said sections together, so that when the sections are folded they will be spaced from each other, and hinges connecting the third section to the free end of one of the two first-named sections, whereby the third section may fold between the two first-named sections.

3. A sample case and exhibitor, comprising three tray-shaped sections, hinges having laterally-offset portions connecting two of said sections together, so that when the sections are folded they will be spaced from each other, hinges connecting the third section to the free end of one of the two first-named sections, whereby the third section may fold between the two first-named sections, the said tray-shaped sections being also capable of opening so as to lie approximately in the same plane, and a case proper formed of two hingedly-connected sections capable of containing the said tray-shaped sections when folded, one section of the case proper having a pin or stud thereon, for the purpose specified.

701,659. HARNESSES. ALFRED WOOD, FOLKSTONE, ENGLAND. Filed Sept. 9, 1900. Serial No. 729,908. (No model.)

Claim.—1. A fastening for harness, comprising an arm member attached to the harness-strap, a band member adapted to slide on said strap, and a loose bolt adapted to slide in one of said members and to normally engage with the other of said members, substantially as described for the purpose specified.

2. A fastening for harness, comprising a curved arm member attached to the harness-strap, a band member provided with a loop and adapted to slide on said strap, a loose bolt adapted to slide in a recess in one of said members and to normally engage with the other of said members, and means for retaining said bolt in engagement, substantially as described for the purpose specified.

3. A fastening for harness, comprising a curved arm member attached to the harness-strap, a band member provided with a loop and adapted to slide on said strap, a loose bolt adapted to slide in a recess in one of said members and to normally engage with the other of said members, a spiral spring for retaining said bolt in engagement, and means for disengaging said bolt against the pressure of said spring in order to release the fastening, substantially as described for the purpose specified.

4. In a fastening for harness, the combination of a curved arm attached to the harness-strap and having a recess in its free end, a band adapted to slide on said harness-strap, a loop formed on said band and provided with a slot through one end, a loose bolt confined in the recess in the said curved arm and normally projecting into the slot in the said loop, and means for normally retaining the bolt in such projecting position, substantially as described for the purpose specified.

5. In a fastening for harness, the combination of a curved arm attached to the harness-strap and having a recess in its free end, a band adapted to slide on said harness-strap, a loop formed on said band and provided with a slot through one end, a loose bolt confined in the recess

in the said curved arm and projecting into the slot in said loop and a spiral spring located in the recess in the curved arm for normally retaining the bolt in such projecting position, substantially as described for the purpose specified.

6. In a fastening for harness, the combination of a curved arm attached to the harness-strap and having a recess in its free end, a band adapted to slide on said harness-strap, a loop formed on said band and provided with a slot through one end, a loose bolt confined in the recess in the said curved arm and projecting into the slot in the said loop, a spiral spring located in the recess in the curved arm for normally retaining the bolt in such projecting position, means for supporting said spiral spring, and means for pressing the bolt into the recess in the curved arm against the force of the spiral spring in order to release the fastening, substantially as described for the purpose specified.

701,660. DRAW-GEAR FOR GARR. CHARLES WADSWORTH, BUREAU, Pa. Filed May 21, 1901. Serial No. 62,948. (No model.)

Claim.—1. The combination with a car-body and a coupler, of a plurality of removable chimes or plates W located above the coupler for adjusting the head of the coupler in a vertical plane and relative to the car-body.

2. The combination with a car-body and a coupler and a spring mechanism, of a plurality of removable chimes W and V for adjusting the coupler and spring mechanism vertically relative to the car-body.

3. The combination with a car-body and a coupler, of a plurality of removable chimes or plates for adjusting the head of the coupler in a vertical plane and relative to the car-body.

4. The combination with a car-body and a coupler and spring mechanism, of a plurality of removable chimes or plates for adjusting the coupler and spring mechanism vertically relative to the car-body.

5. The combination with a car-body and draw-gear, of means for adjusting the draw-gear vertically relative to the car-body, said means being located beneath the ends of the follower or followers and supporting the same.

6. The combination with a car-body and coupler head and shank, of means for adjusting the coupler head and shank vertically relative to the car-body, said means consisting of a plurality of chimes or plates located between the coupler-head and the shank, and some or all of said chimes adapted to be removed and placed above the shank so as to confine the shank and prevent the upward and downward movements of the coupler-head in buffing.

7. The combination with a car-body, coupler, spring mechanism, and follower or followers, of means for adjusting the coupler and spring mechanism and a follower or followers vertically relative to the car-body, said means being located under the follower or followers, and also under the shank of the coupler adjacent its head.

8. The combination with a car-body, of a coupler having a yoke; two followers located within the yoke; springs between the followers; and a plurality of chimes for adjusting the coupler-yoke, followers, and springs in a vertical plane.

9. The combination in a draw-gear, of a coupler; central stringers; stay-plates secured to the stringers and forming pockets; front and rear metal blocks or cast-steel blocks within the pockets; springs located between the blocks; and two followers engaging the springs at their ends and adapted to be moved by the coupler.

10. The combination in a draw-gear, of a coupler; two stay-plates; two followers slotted at the ends; four metallic blocks located between the upper and lower parts of the stay-plates; two springs supported by pins which engage the followers; and removable plates M, whereby the springs can be removed without displacing the coupler or followers.

11. The combination with a draw-gear constructed substantially as set forth, of stay-plates G, each made by bending a piece of metal upon itself and forming pockets for metallic blocks and against which the followers bear in towing and buffing.

12. The combination with a draw-gear, constructed substantially as set forth, of springs Q supported by pins P, which engage blocks L, said blocks L bearing against the blocks J and J', which latter are located between the stay-plates G, as set forth.

13. The combination with a draw-gear, embracing a coupler and followers and constructed substantially as set forth, of two stay-plates,

each stay-plate supporting a front and a rear metallic block and each block having a flange K; blocks L, located adjacent the flanges K; pins P; removable plates M; followers H and T; and springs supported by the pins.

14. The combination in a draw-gear of stay-plates G; a coupler, and a coupler-yoke curved at the end; two followers slotted at the ends and one of the followers having a curved surface; pins P; springs; blocks J J'; and removable plates M.

15. The combination with a draw-gear and chimes for adjusting the coupler, of a stay-plate cut away at X to allow the removal of the chime W, and a carry-iron which normally retains the chime in position by closing the opening formed by cutting away the stay-plate.

16. The combination with a draw-gear, of a plurality of chimes V, and removable plates M, whereby the chime can be removed and replaced.

17. The combination with a draw-gear, of stringers; stay-plates under the stringers; metallic blocks located directly beneath the stringers and within the stay-plates; followers engaging the blocks; and springs engaging the followers at their ends.

18. The combination with a draw-gear, constructed substantially as set forth, of stay-plates, each plate made by bending a metallic plate upon itself to form a pocket; follower-plates; metallic blocks located at the ends of each pocket; and springs located between the follower-plates at the ends of the blocks.

19. The combination with a draw-gear, constructed and operating substantially as set forth, of springs Q; means for holding the springs in place; followers H and T; and a plurality of plates or chimes V.

20. The combination in a draw-gear, of a coupler; a yoke secured to the coupler; followers attached at the ends; pins P which guide the followers; springs Q upon the pins P; spring R located within the yoke; blocks J J'; stay-plates G G' embracing the blocks J J'; removable plates secured to blocks J J' which allow the removal of the springs Q at the sides; and bolts securing the stay-plates to the central stringers.

21. The combination with a draw-gear, constructed substantially as described, of stay-plates G G'; blocks J J' supported by the stay-plates and bolts O; blocks L L' located at the ends of blocks J J'; pins P supported by blocks L L'; springs Q Q' on the pins; two followers engaging the pins; a coupler; a coupler-yoke; and removable plates M M'; as set forth.

22. The combination with a draw-gear, of stay-plates located directly under the central stringers; blocks secured in position beneath the stringers and between the upper and lower portions of the stay-plates; springs located directly under the stringers and in line therewith; a coupler; followers engaging the springs; and means uniting the coupler-shank and the followers.

23. The combination in a draw-gear, of the central stringers A A'; stay-plates each having an upper horizontal portion parallel with and adjacent a stringer and a lower portion parallel with the upper portion and located in a lower horizontal plane; blocks between the upper and lower portions of the stay-plates; and bolts passing through the stringers, the upper and lower portions of the stay-plates, and also through the blocks.

701,661. TRIPLE-SPRING DRAW-GEAR. CHARLES WADSWORTH, BUREAU, Pa. Filed Nov. 2, 1901. Serial No. 62,942. (No model.)

Claim.—1. The combination in a draw-gear, of the metallic draft-plates secured to the perpendicular sides of the central stringers by horizontal bolts and provided with front and rear follower-earings upon their inner faces, said earings having holes through which are passed perpendicular bolts which secure the earings to the central stringers.

2. The combination with the metallic draft-plates secured to the perpendicular faces of the stringers by horizontal bolts passed through the said plates and stringers, of follower-earings having enlarged ends 15 provided with bolt-holes through which are passed perpendicular bolts which secure the earings to the central stringers.

3. The combination with the metallic draft-plates secured to the perpendicular faces of the stringers, of follower-earings, and each of said earings having a horizontal strengthening-rib and a bolt-hole through which passes perpendicular bolt 34, uniting a earring to a stringer.

4. The combination with the metallic draft-plates, of front follower-earings riveted to the faces of the plates and each earring provided with a bolt-hole at the end through which passes a bolt 37 which unites the said earring to the end rail.

5. The combination with the metallic draft-plates having larger horizontal flanges 8, of follower-castings riveted to the faces of the plates, and stay-plates secured to the lower flanges of the draft-plates by rivets; said stay-plates extending from end to end of the metallic draft-plates and beneath the openings made in the sides of the said plates.

6. The combination with the metallic draft-plates, of follower-castings, stay-plates, spring mechanism, and chime located under the coupler-shank and also under the spring mechanism.

7. The combination with the metallic draft-plates, of follower-castings, stay-plates, spring mechanism, and chime; said follower-castings being provided with seats, as 16, for the chime.

8. The combination with the metallic draft-plates, of a spring mechanism, and chime; the said draft-plates being provided with openings which are normally closed by side plates which retain the chime in position.

9. The combination with the metallic draft-plates secured to the sides of the stringers, of follower-castings; a coupler and spring mechanism; stay-plates; a carry-iron; and a plurality of chime, which chime are located beneath the spring mechanism.

10. The combination in a draw-gear, of two central stringers; an end sill; and two draft-plates provided with front and rear follower-castings; the said draft-plates being secured to the stringers by bolts which pass through the stringers, end sill, and castings; the said bolts which pass through the end sill also passing through the ends of the front follower-castings.

11. A metallic draft-plate having a bolster attachment 5 located at right angles to the face of the plate, an end-sill attachment 6 located in a horizontal plane and at right angles to the face of the plate, a stringer attachment 7, midway the ends of the plate, and stay-plate flanges 8; the said draft-plate having an opening midway of its length and a stay-plate 10 secured by rivets to the flanges 8, as set forth.

12. The combination in a draw-gear, of central stringers; draft-plates provided with follower-castings riveted to their faces; a spring mechanism; and means for raising or lowering the spring mechanism relative to the stringers, said means consisting of chime which can be removed from beneath the followers and placed above the same.

13. The combination with the draft-plates, of the front and rear follower-castings having seats 16; the stay-plates; chime resting upon the stay-plates; followers supported upon the chime; a coupler and spring mechanism; and removable plates 22 at the sides.

701,662. BAKER'S STENCIL. LEONARD F. BAKER, Indianapolis, Ind. Filed May 31, 1901. Serial No. 62,578. (No model.)

Claim.—A baker's stencil for marking loaves of bread during the process of baking formed of a comparatively thin plate with the marking-matrices extending a portion of the way only through said plate, and having small perforations in the bottom of said matrices extending the rest of the way through said plate, substantially as described and for the purposes specified.

701,663. RAY-LAKE. ALFRED W. RAY-LAKE, Ann Arbor, Mich. Filed Sept. 3, 1901. Serial No. 74,173. (No model.)

Claim.—1. The combination with the frame of a hay-rake, of a rake-head and its teeth and the hay-guard, an axle, the right-angular extension of said axle and the wheels whose peripheries reach only to the height of the rake-head, carried by said extensions, an arm rigidly attached to the top of the rake-head, a hand-lever in front of said arm, and the rod forming pivotal connection between said lever and said arm, said lever and rod forming a locking-toggle, a foot-trip adapted to unlock said toggle, a duplicate arm rigidly attached to the top of the rake-head, the spring carried by said frame, the bar forming pivotal connection between said duplicate arm and spring, the foot-lever and its upwardly-turned

lower end and the duplicate bar forming pivotal connection between the foot-lever and the duplicate arm, substantially as described.

2. The combination with the frame and head of a hay-rake of an arm rigidly fastened to the top of the rake-head, a hand-lever forward thereof, a rod making pivotal connection between said rake-head arm and said hand-lever, said lever and rod forming a locking-toggle, a foot-trip adapted to unlock said toggle, a foot-lever, an arm backward thereof on said rake-head and a spring forward of said last-named arm having its lower end rigidly attached to the front cross-piece of the frame, a bar having pivotal connection with the upper end of said spring and with the arm back of said spring and a bar also pivotally connected at its rear end to said arm and at its forward end to said foot-lever, substantially as described and set forth.

3. In a hay-rake a spring adapted to raise the rake-head and its teeth having its lower end rigidly attached to a cross-piece of the frame, an arm rigidly attached on the rake-head, a bar forming pivotal connection between said spring and arm, and a foot-lever at the side of said spring and a bar pivotally connecting said foot-lever with said arm and adapted to assist the spring, substantially as described and for the purpose specified.

4. The combination with the frame, end, rake-head, teeth, guards and wheels of a hay-rake, of an arm rigidly attached to the rake-head, a foot-lever pivotally attached to a cross-piece near the front of the frame and having a lower upwardly-bent end, a bar pivotally attached at one end to the upwardly-bent lower end of said foot-lever and at its other end to said arm, a spring having its lower end rigidly attached to said cross-piece, and a bar also having one end pivotally attached to said arm and its other end attached to the upper end of said spring, said spring and its connections being adapted to automatically raise the rake-head and its teeth, substantially as described.

701,664. DEVICE FOR TOPPING BEETS. KLAAS BRIDGWIJED and ADRIAN VAN PUTTEN, Holland, Mich. Filed Mar. 14, 1901. Serial No. 62,182. (No model.)

Claim.—1. In a device for topping beets, the combination with pivotally-connected handles and knives horizontally carried by the handles, of a gage-bar having adjustable and swinging support at the pivot of the handles, which gage-bar automatically assumes a position transversely of and above the cutting edges of the knives when said cutting edges meet and a central position over the space between the cutting edges of the knives when said knives are separated, whereby said bar serves as a gage for the depth of the cut and indicates when the cutting action should be performed, and also serves to hold the severed portions of the beet on the knives after the cut is made, as described.

2. In a device for topping beets, pivotally-connected handles, a bifurcated frame carried by each handle, a horizontal knife adjustably attached to each frame, having cutting edges in the same horizontal plane when the handles are closed, and an adjustable and swinging gage-bar carried by one of the handles and automatically assuming a position within the frames transversely above the knives and centrally with relation to the knives in their open or in their closed position, as described.

3. In a device for topping beets, the combination with pivotally-connected handles, horizontal knives carried by the handles, and a pear-shaped shoulder forming a portion of the outer face of one of the handles, the point of the shoulder being at one side of a vertical line drawn through the center of the pivot of a carrier having a pear-shaped opening to receive the said similarly-shaped shoulder, which opening is sufficiently large to admit of decided rocking motion of the carrier on the shoulder, a horizontal foot forming a portion of the carrier, having an aperture whose wall is threaded, and a gage-rod provided with a threaded section to enter the aperture in the foot of the carrier and a lower section which is above the knives and is vertically and transversely disposed to the cutting edges of the knives and similarly and centrally disposed in the space which may occur between the knives, as specified.

701,665. VEENEH BASKET. EDGAR ABE, Jacksonville, Tex. Filed Jan. 25, 1901. Serial No. 61,181. (No model.)

Claim.—1. A basket comprising a suitable body, a bottom having upstanding slanted and portion, and end sections made in separate pieces from the body and the bottom, each end section extending continuously from one side to the other of the body and having overlapping relation thereto, said end sections having interlocking engagement with the slanted end portions of the bottom.

2. A basket comprising a suitable body, and sections made in separate pieces from the body and provided with flaring rounded corners, and a bottom provided with upstanding members which have overlapping relation to the end sections on lines within the flaring rounded corners thereof, all of said parts being united firmly together.

3. A basket comprising a suitable body, a bottom having upstanding end portions, and separate end sections provided with flaring rounded corners and assembled into overlapping relation to the body and in interlocking engagement with said upstanding portions of the body.

4. A basket comprising a suitable body, a bottom having upstanding end portions, separate end sections each provided with flaring rounded corners and extending continuously from one side to the other of the body, said end sections having overlapping relation to the body and interlocking engagement with the end portions of the body, and means for binding all the parts firmly together.

5. An article of the class described, comprising a bottom having its end portions bent and slanted to form the tongues and the splines, and the end sections bent to form the rounded flaring corners, and having the inwardly-extending flanges, said flanges being received within the side portions of the article, and said end sections fitting in the slanted portions of the bottom, so as to engage with the tongues and the splines.

701,666. FOLDING TABLE. SHELF, OR DECK. GEORGE A. AM, Mount Carroll, Ill. Filed Apr. 10, 1900. Serial No. 712,608. (No model.)

Claim.—The combination with the cabinet formed with bins and discharge-spouts, of the standards or supports for the same, the folding leaf having its rear pivotally and adjustably connected to said standards or supports so as to move up toward the cabinet-bins in folding the leaf, said leaf when lowered being adapted to support itself beneath the discharge-

spouts of the bins, a hinged shelf in front of the cabinet and adapted when dropped to cover the space between the rear edge of the folded leaf and the discharge-spouts to the bins, and means for retaining the leaf in its horizontal position, substantially as and for the purposes described.

701,667. VALVE MECHANISM. EDWIN J. ARMITAGE, Erie, Pa. Filed Nov. 20, 1901. Serial No. 63,064. (No model.)

Claim.—1. A valve mechanism for the purpose described, comprising a valve, a rocking plate and means for actuating it, and a link mechanism including an oscillating rock-arm connected with the rocking plate and through said connection with the valve, whereby said valve is given a rapid movement during portions of the movement of the rocking plate and remains at rest during the remaining movements of the plate.

2. A valve mechanism comprising a valve, a rocking plate, and means for actuating it, a fixed pivot-point, a rock-arm mounted to turn thereon, a link pivoted to the free end of said rock-arm and to the rocking plate, a crank carried by the valve, and a valve-rod connected to said crank and pivoted to said link, the several elements being so proportioned that the valve will remain at rest during a considerable arc of travel of said rocking plate.

3. A valve mechanism comprising a valve, a fixed pivot-point, a link mounted to turn thereon, a rock-arm pivoted to the free end of said rock-arm, means constructed and arranged to move the free end of said link in a definite path, a valve-rod intermediate said link and said valve, the parts being so proportioned that the valve will remain at rest during a considerable movement of said rock-arm and link, but will be given a rapid motion when the said rock-arm and link approach their limit of travel.

4. A valve mechanism, comprising a valve, two fixed pivots, a rocking plate mounted on one of said pivots, and a rock-arm mounted on the other, a link pivotally connecting the free ends of said rocking plate and said rock-arm, and a valve-rod adjustably connected to the valve and pivotally connected to said link, whereby said valve is given a rapid movement during portions of the movement of said rocking plate and rock-arm, and remains at rest during other portions of the movement of said rocking members.

701,668. LIQUID-SPRAYER. LEWIS A. ANSELMI, Jackson, Mich., assignor to Anselmi Manufacturing Company, Jackson, Mich., a Corporation of Michigan. Filed Sept. 26, 1901. Serial No. 70,088. (No model.)

Claim.—1. In a portable liquid-sprayer, the combination with the

liquid-holding barrel, of a device extending into the barrel, and means connected therewith and actuated with and by the movement of the portable sprayer for imparting to said means a swinging movement for keeping the liquid contents in a state of agitation, a hose connected to and movable with the said swinging device, a pipe extending therefrom, and means actuated with and by the movement of the portable sprayer for drawing the liquid from the barrel and forcing the same away for use, substantially as set forth.

2. In a liquid-sprayer, the combination with the liquid-holding barrel and its supports, and a bracket connected to the barrel, of a rocking support pivoted to the bracket, a paddle connected to one end of the rocking support and passing down into the barrel, and means connected to the rocking support and to the main axle of the spraying-machine for swinging the rocking support and the paddle to keep the liquid contents of the barrel in a state of agitation, and a hose passing into the barrel and connected to the paddle and extending from the barrel, substantially as set forth.

3. In a liquid-sprayer, the combination with the liquid-holding barrel and its supports and a bracket connected to the barrel, of a rocking support pivoted to the bracket, a paddle connected to one end of the rocking support and passing down into the barrel and means connected to the rocking support and to the main axle of the spraying-machine for swinging the rocking support and the paddle to keep the liquid contents of the barrel in a state of agitation, and a hose passing into the barrel and connected to the paddle and extending from the barrel, and a similar open end of the hose within the barrel, a pump and connections therefrom and spraying-machine for delivering the liquid, substantially as set forth.

4. In a liquid-sprayer, the combination with the frame, the wheels and the main axle, and a liquid-holding barrel supported thereby, of a bracket secured to the barrel, a rocking support pivoted to the bracket and having a vertical edge 17 and a crank-arm portion, an arm pivoted to the crank-arm portion of the rocking support, an eccentric upon the main axle of the machine and to which said arm is connected, a paddle connected at its upper end to the rocking support with an edge adjustable along the vertical edge 17 and extending down into the barrel, and which paddle is moved back and forth in the barrel for agitating the liquid contents by the said support and eccentric and parts connected therewith, and a hose extending into the barrel connected to and movable with the paddle, and a pipe therefrom outside of the barrel and a pump device connected therewith, a filling-hopper secured to the upper part of the barrel at an opening therein, a removable top within the hopper having an opening through which the paddle passes into the barrel, a sliding plate upon the removable top having a mortise receiving the paddle and said parts acting to prevent, with the movement of the paddle, the liquid contents splashing out, substantially as set forth.

5. In a liquid-sprayer, the combination with the liquid-holding barrel, of a paddle extending into the barrel and means connected therewith for imparting thereto a swinging movement for keeping the liquid contents in a state of agitation, a hose connected to and movable with said swinging paddle and a pipe extending therefrom and means for drawing the liquid from the barrel and forcing the same away for use, and a filling-hopper connected to the barrel at an opening in the upper part and through which filling-hopper the paddle extends, and means within the hopper and surrounding the paddle for preventing the liquid contents splashing out, substantially as set forth.

6. In a liquid-sprayer, the combination with the liquid-holding barrel, of a paddle extending into the barrel and means connected therewith for imparting thereto a swinging movement for keeping the liquid contents in a state of agitation, a hose connected to and movable with said swinging paddle and a pipe extending therefrom and means for drawing the liquid from the barrel and forcing the same away for use, and a hopper connected to the upper part of the barrel at an opening therein, a removable top in said filling-hopper having a longitudinal opening through which the paddle extends into the barrel, a sliding plate upon the removable top with a mortise through which the paddle passes the said plate moving with the paddle and said parts preventing the splashing out of the liquid contents of the barrel, substantially as set forth.

7. In a liquid-sprayer, the combination with the frame, the wheels and the main axle, and a liquid-holding barrel supported thereby, of a bracket secured to the barrel, a rocking support pivoted to the bracket and having a vertical edge 17 and a crank-arm portion, an arm pivoted to the crank-arm portion of the rocking support, an eccentric upon the main axle of the machine and to which said arm is connected, a paddle connected at its upper end to the rocking support with an edge adjustable along the vertical edge 17 and extending down into the barrel and which paddle is movable back and forth in the barrel for agitating the liquid contents by the said support and eccentric and parts connected therewith, a hose extending into the barrel connected to and movable with the paddle, a pipe therefrom outside of the barrel and a pump device connected therewith, a filling-hopper secured to the upper part of the barrel at an opening therein, a removable top within the hopper having an opening through which the paddle passes into the barrel, a sliding plate upon the removable top having a mortise receiving the paddle and said parts acting to prevent, with the movement of the paddle, the liquid contents splashing out, substantially as set forth.

8. In a liquid-sprayer, the combination with the frame, the wheels, their axle and a liquid-holding barrel, of a device extending into the barrel and means for supporting and connecting the same to the axle of the machine and by which a swinging movement is imparted to the device for agitating the liquid contents of the barrel, and a hose and strainer connected therewith and supported by said device and moving therewith, and a connection from said hose and device acting therewith for removing the liquid contents from the barrel, substantially as set forth.

9. In a liquid-sprayer, the combination with the liquid-holding barrel having an opening in the upper end, of a filling-hopper a connected thereto and having a flange extending into the opening in the barrel, a removable top having a flange to rest upon and extend into the flange of the hopper and having a longitudinal opening in the said top, and a sliding plate having a mortise opening resting upon the removable top of the hopper, substantially as described.

701,689. HORN-COUPLES. JAMES R. ATKINSON, Montreal, Canada. Filed Sept. 2, 1901. Serial No. 74,491. (No model.)

Claim.—1. The horn-coupling described comprising the yoke adapted to receive a hose in its right, a cross-bar bridging the yoke and bearing a cam-lever, and the clamping-block movable on the side bars of the yoke between the right thereof and the cam-lever; said clamping-block being separate from the cam-lever, and arranged to be pressed and held by the same against the hose.

2. In a horn-coupling, the combination of a frame having a yoke at one end and an inclined portion at its opposite end, a clamping-block movable on the side bars of the yoke, and a lever fulcrumed in the frame and having a cam-head for engaging the clamping-block; said lever being adapted when rocked to carry the cam-head into engagement with the clamping-block to bring up against the inclined portion of the frame.

3. The combination of a pipe-section, a hose arranged on and receiving the end of the pipe, and the coupling described comprising the open frame having the yoke at one end and receiving the hose, and the inclined portion at its opposite end, the clamping-block movable on the side bars of the yoke and having the cam-head under side, the lever fulcrumed on said cam-head and having a cam-head to engage the clamping-block; said lever being adapted when rocked to carry the cam-head into engagement with the clamping-block to bring up against the inclined portion of the frame, and spacing-collars surrounding the cross-bar and interposed between the sides of the lever and the side bars of the frame.

701,670. TAPPING-JACKET. NILES RABBITT, Grand Forks, Canada, assignor of one-half to Francis H. Hutton, Grand Forks, British Columbia, Canada. Filed Jan. 28, 1902. Serial No. 68,496. (No model.)

Claim.—1. A tapping-jacket, comprising a receptacle for holding hot metal; a pair of hollow members, means for detachably securing said members upon said metal for holding hot metal, and a plurality of pipes for circulating a fluid through said members independently.

2. A tapping-jacket, comprising a pair of hollow members provided with independent compartments for holding a circulating liquid, the said members being provided with apertures of proper shape to form a tap-hole when fitted together in juxtaposition, and supply and exit pipes connected with said hollow members.

3. A tapping-jacket, comprising a pair of hollow members meeting each other and provided with complementary apertures, said apertures being adapted to form a tap-hole of substantially cylindrical form when said members are fitted together, and means for supplying a circulating liquid to said members separately.

4. A tapping-jacket, comprising members provided with compartments for holding a circulating liquid, and having a tap-hole adjacent to said compartments and free from same, and means for supplying a liquid to said compartments.

5. A tapping-jacket, comprising a pair of hollow members mated together and each having a substantially semi-circular aperture, and means for supplying a circulating fluid to said hollow members.

6. A tapping-jacket, comprising a plurality of hollow members adapted to be fitted together, and provided with separate compartments and also provided with apertures constituting fragmentary portions of a tap-hole, and means for supplying a circulating fluid to said hollow members.

7. A tapping-jacket, comprising a pair of members meeting each other and provided with separate water-tight compartments and with apertures for forming a tap-hole, and means for rendering said members interchangeable, so that one may be removed without affecting the other.

8. A tapping-jacket, comprising a pair of hollow members provided with separate compartments for holding a circulating liquid and with fluid-tight apertures free from same, said apertures being adapted to form a tap-hole when placed in juxtaposition, and supply and exit pipes connected with said hollow members.

9. A tapping-jacket, comprising a pair of hollow members provided with independent compartments for holding a circulating liquid and also provided with apertures constituting fragmentary portions of a tap-hole, means for supplying a circulating liquid to said hollow members, and a plurality of outlets connected with said hollow members and located upon opposite sides of said tap-hole.

701,671. HYPODERMIC SYRINGE. JOHN A. BELLING, Rochester, Mass. Filed Aug. 2, 1901. Serial No. 70,704. (No model.)

Claim.—In a hypodermic syringe, the combination with the cylinder provided at one end with a hollow needle and at its other end with a

removable screw-cap having a mortise in its outer side at one side of the center, of a hollow reciprocating plunger arranged in the cylinder and provided with an unobstructed opening at its inner end and a valve-seat in its outer end, a threaded valve arranged in the outer end of the plunger, and arranged to seat against said valve-seat and close the hollow plunger, a lateral vent formed in the plunger in rear of said valve-seat and leading to the atmosphere whereby when the valve is moved away from its seat the cylinder is placed in communication with the atmosphere, and a pin carried by the outer end of the plunger and arranged to enter said mortise and lock the plunger against rotation when the latter is clamped within the cylinder, substantially as described.

701,672. COIN-CONTROLLED TICKET-DELIVERING DEVICE. MARCEL BERNIER, La Rochelle, France. Filed Oct. 18, 1901. Serial No. 72,573. (No model.)

Claim.—1. In an apparatus of the character described the combination with a suitable box, of a door hinged at its upper edge having an opening for exposing a coin, a second opening for exposing a coupon, a third opening for exposing a ticket attached to the coupon, a slide-way in the box behind the coin-opening, and a slide-way in the box behind the ticket and coupon-opening, said latter slide-way being open at the bottom for the discharge of the ticket and coupon, and the coin-slide-way open at the top for the introduction of the coin, means operated by the closing of the door to separate the ticket from the coupon as axle extending laterally through the box, and slidable therein, a lateral arm on the inner end of the axle, a handle on its outer end, means for feeding the separated ticket to slightly project from the box, and connecting mechanism whereby the feeding means is operated by the movement of the axle longitudinally, substantially as described.

2. In an apparatus of the character described, the combination with a box, having a coin-slide-way and a ticket and coupon slide-way and a door hinged at its upper edge having a coin-exposing opening and ticket and coupon exposing openings, of a handle on the coupon when the door is closed, a spring-impelled feed-cylinder bearing against the exposed ticket on the inside, a stop for holding said cylinder against the action of the spring, and means whereby said stop is withdrawn to permit the feed-cylinder to operate when the handle is pulled outward, substantially as described.

3. In an apparatus of the character described, the combination with a box, having a coin-slide-way and a ticket and coupon slide-way and a door hinged at its upper edge having a coin-exposing opening and ticket and coupon exposing openings, of a handle on the coupon when the door is closed, a shaft parallel to the axle, a ticket-feed cylinder on said shaft provided with a recess, a lug on the axle normally engaging in said recess and withdrawn when the axle is drawn outward, a sleeve on the cylinder-shaft, a lever secured to said sleeve and slidably connected at its outer end to the door, and connections whereby the opening of the door will return the feed-sleeve to its normal position, substantially as described.

701,678. COMBINATION HAIR DRIER AND COMB. CHARLES E. BRADSHAW, Cleveland, Ohio. Filed Oct. 4, 1901. Serial No. 77,512. (No model.)

Claim.—1. In a device for drying the hair, a hollow metallic shell, a solid body within the shell for housing the same, said body being smaller than the hollow of the shell, pins secured to said body for centrally supporting it within the shell, and a handle secured to the shell, for the purpose specified.

2. In a device for drying the hair, a hollow oval-shaped metallic shell composed of two parts hinged together, each projecting from said shell, means adapted for being heated and for insertion within the hollow of the shell, means for holding the parts of the shell closed, and a handle of relatively non-conducting material secured to one of the parts of the shell, for the purpose specified.

3. In a device of the character described, a hollow metallic shell composed of two parts hinged together, a body adapted for heating and for insertion within the hollow of the shell, pins projecting from said body by means of which it is supported within the shell, and a handle of relatively non-conducting material secured to one of the parts of the shell.

4. In a device of the character described, a hollow metallic shell composed of two parts hinged together, a body adapted for being heated and for insertion within the hollow of the shell, pins projecting from said body by means of which it is supported within the shell, a plurality of rows of comb-teeth projecting from the parts of the shell, and a handle secured to the shell, for the purpose specified.

5. In a device of the character described, a hollow metallic shell composed of two parts hinged together, comb-teeth projecting from the shell, a handle of relatively non-conducting material secured to one part, a ferrule rotatably mounted on the handle adjacent the shell, said ferrule having a notch, a lug on the hinged part of the shell adapted to enter the notch, for the purpose specified, and means for heating the shell.

6. In a device of the character described, a hollow metallic shell composed of two parts hinged together, a handle of relatively non-conducting material secured to one part, a ferrule rotatably mounted on the handle adjacent the shell, said ferrule having a notch, a lug on the hinged part of the shell adapted to enter the notch, for the purpose specified, comb-teeth projecting from the parts of the shell, a body adapted for being heated and for insertion within the hollow of the shell, and pins projecting from said body by means of which it is supported within the shell, substantially as described.

701,674. PLACKET-CLOSING DEVICE. CHARLES BRAND, New York, N. Y. Filed Sept. 20, 1901. Serial No. 78,908. (No model.)

Claim.—1. A placket-closing device comprising a chain or chain adapted to be secured in the skirt at the opposite side of the placket-opening, fastening device secured in the waistband portion of the skirt and with which said chain or chains are connected, means for detachably connecting said fastening device, and upwardly-directed hooks connected therewith which open downwardly, said chain or chains at the opposite side of the placket-opening being also connected by spiral springs, substantially as shown and described.

2. The herein-described means for closing a placket, comprising flexible device adapted to be secured in a skirt at the opposite side of the placket-opening, fastening device secured to the waistband portion of the skirt and with which said flexible device are connected, means for detachably connecting said fastening device, and upwardly-directed hooks connected therewith which open downwardly, said flexible device at the opposite side of the placket-opening being also connected by expansive device, substantially as shown and described.

3. In a placket-closing and skirt-supporting device, fastening device comprising two similar members each of which comprises a main horizontal portion provided centrally with an upwardly-directed hook which opens downwardly the main horizontal portions being provided with hooks at their adjacent ends which are adapted to be connected and the oppo-

sites or outer ends thereof being adapted to be secured in a garment, substantially as shown and described.

4. The herein-described means for closing a placket-opening consisting of flexible device secured in the flaps of the skirt at the opposite sides of the placket-opening and connected by transverse spiral springs, and fastening device secured to the top or waistband of the skirt with which said first-named device are connected, said last-named fastening device being also adapted to be connected and being provided with upwardly-directed hooks which open downwardly.

701,675. WATER-METER. HARRY F. BROWN, Chicago, Ill. Filed Aug. 5, 1901. Serial No. 70,589. (No model.)

Claim.—1. In a meter the combination of a base provided with inlet and outlet ports, a piston-rod removably seated upon the base and having parts communicating with the ports thereof, and a superposed part meeting the base and forming there-with a casing, the piston-rod being connected with said superposed part, so as to be carried thereby when removed, substantially as described.

2. In a meter the combination of a base, provided with inlet and outlet ports, a piston-rod having parts communicating with the ports of the base, the base being provided with a socket in which the piston-rod fits, and a superposed part meeting the base and forming there-with a casing which incloses the piston-rod, the piston-rod being connected with said superposed part, so as to be carried thereby when removed, substantially as described.

3. In a meter the combination of a piston-rod provided with inlet and outlet ports and a meter-casing including the piston-rod and having a base provided with a socket in which the piston-rod fits snugly, said base being provided also with inlet and outlet ports communicating directly with the ports of the piston-rod, substantially as described.

4. In a meter the combination of a piston-rod provided with inlet and outlet ports, a base provided with a socket in which the piston-rod fits, and with parts communicating with the ports of the piston-rod, one of said parts of the base terminating in an annular channel which surrounds the piston-rod, and means for detachably connecting the piston-rod and base, substantially as described.

5. In a meter the combination of a piston-rod provided with inlet and outlet ports, a base provided with a socket in which the piston-rod fits and with parts communicating with the ports of the piston-rod, a superposed part covering the joint between the piston-rod and base, and means for connecting the piston-rod and superposed part, substantially as described.

6. In a meter the combination of a base permanently connected in the waterway provided with inlet and outlet ports, a superposed part contacting with the base and forming there-with the meter-casing, means whereby said superposed part and base are detachably connected, and a moving system carried by said superposed part, substantially as described.

7. In a meter, the combination of a piston, a casing having a chamber occupied by the piston and having inlet and outlet ports, and a meter-casing including the piston-casing and having a base permanently connected in the waterway, said base being provided with a socket in which the piston-casing fits snugly and being provided also with inlet and outlet ports communicating directly with the ports of the piston-casing, substantially as described.

8. In a meter the combination of a base provided with inlet and outlet ports, a superposed part contacting with the base and forming there-with a casing, a piston-rod having parts registering with the ports of the base, means connecting the superposed part and piston-rod, means

detachably connecting the piston-casing and base, and a moving system carried by the superposed part, substantially as described.

9. In a meter the combination of a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing removably seated upon the base and having parts communicating with the ports thereof, a superposed part meeting the base and forming a joint therewith, said superposed part and piston-casing being connected, a tube, and means reaching down into the said tube and engaging said superposed part for handling it, substantially as described.

10. In a meter the combination of a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing having parts communicating with the ports of the base, the base being provided with a socket in which the piston-casing fits, a superposed part meeting the base and forming there-with a casing which incloses the piston-casing, the piston-casing being connected with said superposed part so as to be carried thereby when removed, a tube through which said piston-casing and superposed part may be removed or put in place, and means reaching down into the said tube and engaging said superposed part for handling it, substantially as described.

11. In a meter the combination of a base permanently connected in the waterway and provided with inlet and outlet ports, a superposed part contacting with the base and forming there-with the meter-casing, means whereby said superposed part and base are detachably connected, a piston-casing inclosed by the meter-casing, a moving system carried by said superposed part, a tube through which said superposed part and its accessories may be removed or put in place, and means reaching down into the said tube and engaging said superposed part for handling it, substantially as described.

12. In a meter the combination of a base permanently connected in the waterway and provided with inlet and outlet ports, a superposed part contacting with the base and forming there-with the meter-casing, means whereby said superposed part may be connected with or disconnected from the base by a bodily rotation of said part, a piston-casing inclosed by the meter-casing, a moving system carried by said superposed part, a tube through which said superposed part may be removed or put in place, and means reaching down into the said tube and engaging said superposed part for handling it, substantially as described.

13. In a meter the combination of a base permanently connected in the waterway and having inlet and outlet ports, a superposed part contacting with the base and forming there-with a casing, a piston-casing having parts communicating with the ports of the base, means connecting the superposed part and piston-casing whereby the one carries the other, means detachably connecting the piston-casing and base, a moving system carried by the superposed part, a tube through which said superposed part and piston-casing may be put in place or removed, and means reaching down into the said tube and engaging said superposed part for handling it, substantially as described.

14. In a meter the combination of a meter-casing including a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing inclosed by the meter-casing and removably seated directly upon the base and having parts communicating with the ports thereof, a tube also seated upon the said base and forming there-with the meter-box, and means reaching down into the said tube and engaging said piston-casing for handling it, substantially as described.

15. In a meter the combination of a meter-casing including a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing inclosed by the meter-casing and removably seated directly upon the base and having parts communicating with the ports thereof, means whereby said piston-casing and base may be connected or disconnected by a bodily rotation of the piston-casing, and a tube also seated upon said base, substantially as described.

16. In a meter the combination of a meter-casing including a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing inclosed by the meter-casing and removably seated directly upon the base and having parts communicating with the ports thereof, said piston-casing and base having threaded engagement with each other, a tube also seated upon said base and forming there-with the meter-box, and means reaching down into the said tube and engaging the piston-casing for handling it, substantially as described.

17. In a meter the combination of a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing removably seated upon the base and having parts communicating with the ports thereof, a superposed part meeting the base and forming there-with a casing inclosing the piston-casing, means connecting said superposed part and piston-casing, and a tube also seated upon said base and forming there-with the meter-box, substantially as described.

18. In a meter the combination of a base permanently connected in the waterway and provided with inlet and outlet ports, a piston-casing having parts communicating with the ports of the base, the base being provided with a socket in which the piston-casing fits, a superposed part meeting the base and forming there-with a casing, which incloses the pi-

ston-casing, the piston-casing being connected with said superposed part so as to be carried thereby when removed, and a tube also seated upon said base, substantially as described.

19. A base for a meter permanently connected in the waterway and provided with a socket adapted to receive the piston-casing and with inlet and outlet ports, one of which terminates in an annular channel surrounding said socket, a plug adapted to fit in said socket and having parts communicating with the ports of the base, and means for detachably connecting the plug and base, substantially as described.

20. In a meter, the combination of a meter-casing comprising a base permanently connected in the waterway and having inlet and outlet ports and a removable superposed part, and a piston-casing inclosed by the meter-casing and having parts communicating directly with the ports of the base, said piston-casing being removably supported by the base whereby it may be removed from above, leaving the base in undisturbed relation to the waterway, substantially as described.

701,676. SELF-CLOSING GATE. ROBERT H. CARPENTER, Florence, Colo. Filed Jan. 15, 1902. Serial No. 90,332. (No model.)

Claim.—A self-closing gate, comprising an angular post, a member loosely mounted thereon and free to swing, a pulley mounted upon said post in a plane parallel with the general axial direction of said post and having one of its edges flush with the angular corner thereof, another pulley mounted upon said post at right angles with the general direction of said first-mentioned pulley and in immediate proximity thereto, one of said pulleys being so disposed upon said post as to overreach said angular corner thereof by a distance commensurate with the thickness of said other pulley, and a flexible member partially engaging said pulleys and also engaging said gate, the arrangement being such that said flexible member is guided around a single angular corner of said post, the two pulleys being mounted in casings and provided with guards to prevent the displacement of said flexible member.

701,677. SET OF TYPE FOR PRINTING CALENDARS. JOHN L. CARROLL, Baltimore, Md. Filed Nov. 15, 1901. Serial No. 82,344. (No model.)

Claim.—1. The herein-described set of type characters for printing calendars, comprising a plurality of block-type each containing four characters in vertical line one above the other and representing four days of the month one week apart; a plurality of block-type each containing three characters in vertical line one above the other and representing three days of the month one week apart; and a plurality of block-type each containing one character representing one day of the month, substantially as set forth.

2. The herein-described set of type characters for printing calendars, comprising five block-type, each containing four numerals arranged one above the other and representing days of the month one week apart; two block-type, each containing three numerals also arranged one above the other and representing other days of the month one week apart; five in-

dividual block-type each containing one numeral representing one day of the month; and two auxiliary block-type each containing two numerals which together correspond to numerals on four of the five individual type, substantially as set forth.

3. The herein-described set of type characters for printing calendars, comprising vertical lines of block-type, *a*, containing respectively the sets of numerals "1-6-12-22," "4-11-18-25," "5-12-19-26," "6-12-20-27," and "7-14-21-28;" vertical lines of block-type, *b*, containing respectively sets of numerals "2-9-16" and "3-10-17;" and individual block-type, *c*, containing respectively the numerals "23," "24," "29," "30," and "31," as set forth.

701,678. FLOOD-GATE. HERMAN R. GARRISON, St. Marys, Ohio. Filed Feb. 26, 1902. Serial No. 86,557. (No model.)

Claim.—1. In a flood-gate, the combination of a gate hinged to turn on a horizontal axis, and a buffer-bar disposed in the path of the gate and adapted to yield to its upward movement.

2. In a flood-gate, the combination of guideways, a gate having transverse slides fitted in one pair of said guideways, and a buffer-bar disposed in the path of the gate, and means for slidably confining the buffer-bar in operative relation to said gate.

3. In a flood-gate, the combination of pairs of guideways, a gate having transverse slides fitted in one pair of said guideways, and a buffer-bar also provided with transverse slides which are slidably received in the other pair of said guideways, said gate and the buffer-bar being free to turn on a horizontal axis, and either of said parts being adapted to rise and fall in the guideways.

4. In a flood-gate, the combination with a horizontally-hung gate, of a buffer-bar mounted to turn on a horizontal axis, and having overlapping relation with the gate, a buffer-bar disposed in the path of said buffer-bar, and means for confining said buffer-bar in place.

701,679. THROTTLE-VALVE. JOHN S. GRANTHER, Elizabeth, N. J. Filed June 1, 1901. Serial No. 82,061. (No model.)

Claim.—1. A throttle-valve comprising a valve-rod provided with upper and lower valve-seats, upper and lower valve-extensions fitted to said seats and provided with tubular extensions, the tubular extension on the lower valve being arranged to telescope within the tubular extension on the upper valve-section, a valve-rod for operating the sections, the said sections having a rotary engagement with the rod and the upper valve-section being connected to the rod to move with it independently of the lower valve-section, the passage-way of steam past the lower valve-section leading from a point above the upper valve-seat, substantially as set forth.

2. A throttle-valve comprising a valve-rod provided with upper and lower valve-seats, an upper valve-section and a lower valve-section fitted to said seats, a valve-rod for operating the valve-sections, the said rod having a connection with the upper valve-section to operate it independently of the lower valve-section, an annular cap below the lower valve-seat and in communication with the interior of the valve-rod

and a counterbalance-piston connected with the valve-rod and adapted to work in said annular cap, substantially as set forth.

3. A throttle-valve comprising a valve-rod provided with upper and lower valve-seats, upper and lower valve-extensions fitted to said seats, a valve-rod connected with said valve-extensions for operating them, an annular cap removably attached to the bottom of the valve-rod and a counterbalance-piston connected with the valve-rod and arranged to work in said cap, substantially as set forth.

701,680. SOCKET FOR INCANDESCENT LAMPS. CHARLES A. CHASE, Chicago, Ill. Filed Jan. 16, 1902. Serial No. 86,947. (No model.)

Claim.—1. A socket for incandescent lamps comprising a tubular portion, a base portion, a diaphragm-like body between the two, a slot in the side of the tubular portion, a terminal which fits in said slot and projects downwardly so as to be secured at the base, and means for securing the terminal comprising a screw-bolt with head and nut, a cut-away portion in the base to receive the head, a cut-away portion to receive the nut, a shoulder on the base to receive the nut, an aperture in the terminal to receive the shoulder, a cut-away portion to receive the nut whereby the bolt and terminal may be manipulated by slightly loosening the nut and raising or lowering the parts through their respective openings.

2. A socket for incandescent lamps consisting of a tubular portion, a base portion, a diaphragm between the two, suitable apertures and openings, a terminal vertically movable along said base, a horizontal screw-bolt passing through each terminal, and openings and recesses in the base whereby each terminal and bolt may be moved vertically in or out of engagement with each opening in the base, the screw traveling sideways in each vertical motion.

701,681. TAP-MEASURE. WILLIAM CHRISTMAS, Sheffield, England. Filed Nov. 16, 1901. Serial No. 82,546. (No model.)

Claim.—A tap-measure having a case with a winding-reel therein, and a lifting handle pivoted to a hinge-pin on the reel, said handle when closed being substantially flush with the case, and having a lever-arm projecting to the rear of the hinge-pin, so as to form an opening thumb-piece for the handle when closed, the case having a recess to allow the extension to be pressed downwardly; substantially as described.

701,682. FENDER. BRUNN E. CLARK, St. Louis, and ERNEST E. CLARK, St. Louis, Mo. Filed Apr. 12, 1901. Serial No. 86,686. (No model.)

Claim.—1. The combination with a fender traveling normally above the track, a trigger for holding it in that position, and means for automatically tripping the trigger; of a rod connected with said trigger and leading to emergency-brake mechanism whereby the tripping of the trigger will cause the application of said brake, a circuit-breaker having one terminal carried by said rod and the other by a relatively stationary part,

and an electric circuit leading from the source of energy through these terminals to the controller.

2. In a fender, the combination with the fender proper pivoted beneath the car-platform, depending flanges along the sides of the fender, rollers at its front corners, and a footer comprising a frame whose side bars move longitudinally in the fender proper and whose front cross-bar projects beyond said rollers and is made web; of a trigger pivoted beneath the platform with its lower edge engaging the rear end of the footer when said end is depressed, said lower edge being adapted to be pushed out of engagement by the movement of the footer.

3. In a fender, the combination with the fender proper having one side of the car-platform, guides along the sides of the fender, and a footer comprising a frame whose side bars move longitudinally in the guides and whose cross-bars are free; of springs throwing the front end of the footer normally downward, manual means for raising the front end of the footer against the tension of said springs, a trigger pivoted beneath the platform with its lower edge engaging the rear end of the footer when said end is depressed, said lower edge being adapted to be pushed out of engagement by the movement of the footer, and a positive trip engaging the trigger and adapted to be manipulated by the motorman.

4. In a fender, the combination with the fender proper pivoted beneath the car-platform and extending to the rear of said pivot, a trigger pivoted beneath the platform with its lower edge adapted to engage the rear end of the fender when depressed, and a spring throwing the trigger normally forward; of a stop depending from the dashboard forward of the pivot of the fender for the purpose set forth; means for manually raising the front end of the fender into contact with this stop, and means for tripping the trigger.

701,683. LOOM-HARNESSE OVERER. ARTHUR E. COWAN, Worcester, Mass., assignor to Orlington & Knowles Loom Works, Worcester, Mass., a Corporation of Massachusetts. Filed Feb. 21, 1902. Serial No. 85,911. (No model.)

Claim.—1. In a loom-harness overer, the combination with the lever-bar, made in two parts or sections, one part adapted to extend over and engage the other, so that both parts will move together, in the operation of the loom, of means for disengaging the part engaged by the hooked jaws, from the other part, allowing it to move inward, to lower the harnesses, substantially as shown and described.

2. In a loom-harness overer, the combination with the lever-bar, made in two parts, one part adapted to extend over the other, and provided with a lip or projection on its rear edge to hold the parts together, of means for disengaging the upper part from the lower part, and allowing it to move inward, to lower the harnesses, substantially as shown and described.

3. In a loom-harness overer, the combination with the lever-bar, made in two parts or sections, one part adapted to extend over and engage the other, so that both parts will move together in the operation of the loom, of means for disengaging the part engaged by the hooked jaws, from the other part, and allowing it to move inward, to lower the harnesses, said means comprising a rock-shaft, means for rocking said shaft, a crank on said shaft, a link connected with said crank, and with the part of the lever-bar engaged by the hooked jaws, and a pin engaging the slot in which the lever-bar slides, substantially as shown and described.

701,684. WEIGHING APPARATUS. LEONARD E. COWAN, London, England. Filed Oct. 20, 1901. Serial No. 79,718. (No model.)

Claim.—1. In weighing apparatus, the combination with a scale-beam having a weight-pan at one end and a goods-pan at the other end, of a rotary device bearing indications representing monetary values, a non-rotary device bearing indications representing the rates at which the goods to be weighed are sold, a spring adapted to be more or less distorted by the combined weight of the weights and goods acting on the scale-beam, and

means for transmitting motion to said rotary device in accordance with the extent of distortion of said spring for the purpose specified.

2. In weighing apparatus, the combination with a scale-beam having a weight-pan at one end and a goods-pan at the other end, of a rotary device bearing indications representing monetary values, a non-rotary device bearing indications representing the rates at which the goods to be weighed are sold, a piece rectilinearly movable in which said scale-beam is fulcrumed, a spring by which said movable piece is suspended from a suitable standard and means for converting the said rectilinear movements of the movable piece into rotary movements of the said rotary device for the purpose specified.

3. In a weighing apparatus, the combination with a scale-beam having a weight-pan at one end and a goods-pan at the other end, of a plurality of rotary drums bearing indications representing monetary values, an external non-rotary casing bearing indications representing the rates at which the goods to be weighed are sold and formed with a longitudinal slot through which the monetary values on the drums are exhibited, a rectilinearly-movable slide in which said scale-beam is fulcrumed, a spring by which said slide is suspended from a suitable standard, and means for converting the said rectilinear movements of the slide into rotary movements of the drums for the purpose specified.

4. In weighing apparatus, the combination with a scale-beam having a weight-pan at one end and a goods-pan at the other end, of a plurality of concentrically-arranged rotary drums bearing indications representing monetary values, each drum excepting the innermost one being longitudinally slotted, an external non-rotary cylindrical casing bearing indications representing the rates at which the goods to be weighed are sold and formed, contiguous to said indications, with a longitudinal slot through which the monetary values are exhibited, a rectilinearly-movable slide in which said scale-beam is fulcrumed, a frame in which said slide moves and by which it is guided, a spring by which said slide is suspended from the frame, means for flexibly connecting said frame to a standard so that the drums and their casing can move laterally to assume a truly vertical position irrespective of said standard, means for limiting the extent of such lateral movement, bearings for the said drums, a central stem to which one of said drums is connected, means for converting the rectilinear movement of the slide into rotary movement and transmitting the same to said stem, means for causing the drum that is connected with the stem to impart rotary movement to the other drums, and means for returning said drums to their normal position after the weighing operation substantially as described.

5. In weighing apparatus, the combination with the scale-beam having a weight-pan at one end and a goods-pan at the other end, of a plurality of concentrically-arranged rotary drums bearing indications representing monetary values, each drum excepting the innermost one being longitudinally slotted, an external non-rotary cylindrical casing bearing indications representing the rates at which the goods to be weighed are sold and formed, contiguous to said indications, with a longitudinal slot through which the monetary values on the drums are exhibited, a rectilinearly-movable slide in which said scale-beam is fulcrumed, a frame

in which said slide moves, rollers on said slide engaging with said frame for guiding the slide, a spiral spring by which said slide is suspended from the frame, means for flexibly connecting said frame to a standard, a finger on said standard entering a recess in the bottom of the said cylindrical casing, bearings for the said rotary drums, a central hollow drum in which the innermost of said drums is mounted, a quick-threaded screw at the upper end of said drum, a nut on said slide engaging with said screw, means for lubricating said screw and nut, projections on said drums adapted to successively impinge as each drum performs a complete revolution and to thus transmit the rotary motion of one drum to another, and a spring for returning the drums to their normal position after each weighing operation, substantially as described.

701,685. ELECTRO-PNEUMATIC SWITCH SYSTEM FOR ELECTRIC RAILWAYS. WILLIAM H. CHAMBER, Toledo, Ohio. Filed Nov. 1, 1901. Serial No. 11,102. (No model.)

Claim.—1. In an electro-pneumatic switch system for electric railways, the combination with a main line of track electrically equipped for operating cars thereon, of a switch in the main track provided with mechanism for opening and closing the switch by air-pressure; an air-supply connected to the switch mechanism; a valve in the connection adapted, when opened, to admit air from the air-supply to the switch mechanism; and means to open the valve by a current of electricity through the current-controller of a passing car.

2. In an electro-pneumatic switch system for electric railways, an open independent electric circuit comprising a main lead-conductor connected to a dynamo, a section of the line conductor insulated therefrom and connected to the main lead-conductor by a feed-conductor for the section including the winding of a magnet, and a return-conductor, adapted to be closed by the wiring of a car, in combination with a main line of track; a switch-track therefrom; a switch-point adapted to close or open the switch-track; means to operate the switch-point by air-pressure to open or close the switch; an air-supply connected to the switch; a valve in the connection adapted, when open, to admit air to open the switch, and, when closed, to release the air and leave the switch free; means to electrically open the valve by a current through the winding of the magnet, established by the closing of the circuit by a passing car, and means to automatically close the valve when it is electrically released by a breaking of the circuit.

3. In an electro-pneumatic switch system for electric railways, an open independent electric circuit comprising a main lead-conductor connected with a dynamo; a section of the line conductor, insulated therefrom and connected in the main lead-conductor by a feed-conductor for the section having included therein the winding of a magnet, and a return-conductor, adapted to be closed by the wiring of a car, in combination with a main line of track, a switch-track therefrom, a switch-point

adapted to close or open the switch-track, means to operate the switch-point by air-pressure to open or close the switch; an air-supply connected to the switch; a valve in the connection adapted, when open, to admit air to close the switch and, when the valve is closed, to release the air and leave the switch free; means to electrically open the valve by a current through the winding of the magnet established by the closing of the circuit by a passing car; and means to automatically close the valve when electrically released by a breaking of the circuit.

4. In an electro-pneumatic switch system for electric railways, a main line of track, a switch-track therefrom, a switch adapted to close or open the switch-track, means to operate the switch by air-pressure, to open or close the switch, an air-supply connected to the switch-operating mechanism, a valve in the connection adapted, when open, to admit air to open the switch and, when closed, to release the air and leave the switch free, in combination with an open independent electric circuit comprising a main lead-conductor connected to a dynamo; a line conductor connected to the main lead-conductor, and looped around the switch; an insulated section of the line conductor in alignment therewith within the loop, a feed-conductor for the section connected to the section and the loop, having included therein the winding of a magnet, and a return-conductor, the open circuit thus formed being adapted to be closed by the wiring of a car, means to electrically open the air-valve by a current through the winding of the magnet established by the closing of the circuit by a passing car, and means to automatically close the valve when it is electrically released by a breaking of the circuit.

5. In an electro-pneumatic switch system for electric railways, the combination with an electrically-equipped railway-track, having a plurality of switches, of an air-compressor; a receiver for the air-compressor; an air-main extending from the receiver along the track by the switches; a cylinder for each switch, having a piston operatively connected to its switch-point, and adapted, when moved in one direction, to open, and in the opposite direction, to close the switch; a branch pipe from the air-main to each end of the cylinder; a two-way valve in each branch pipe, adapted, when opened, to admit air to the cylinder and when closed, to release it therefrom; a lever for each valve; means connected to the levers to yieldingly hold the valves normally closed and automatically close them when opened and released; a loop in the line conductor around each switch; an approach and a passing section of the line conductor spanning the loop; circuit-breakers connecting the sections with each other and with the line conductor; an independent feed-conductor for each section, connecting the section with the loop and including the winding of a magnet having its core linked to the lever of a valve and adapted to be moved to open the valve by a current through the winding of a magnet, that of the approach section with the lever of the valve adapted to admit air to the cylinder to open the switch, and of the passing section, with the valve adapted to admit air to the opposite end of the cylinder and close the switch, and a return-conductor, forming with each section, its feed-conductor, and the loop, an independent open circuit, adapted to be closed by the wiring of a passing car, and kept closed or open by the current-controller of the car while the car is passing the section, and automatically opened again when the car has passed the section.

701,686. CAN-OPENER. HORACE E. DAY, Steubenville, Ohio. Filed Sept. 12, 1901. Serial No. 10,152. (No model.)

Claim.—In a can-opener, a handle formed of one piece of metal bent to form a yoke, a tool comprising a body portion pivotally connected to said handle and having a portion thereof inclosed by said yoke, a spring-clamp carrying prongs for engagement with the sides of one end of said body portion of the tool carried by the handle, a can-opener carried by one end of said tool, a slidable cutter mounted on said tool, said tool adapted to be swung on its pivotal point whereby the can-opener may be inclosed by the handle and engaged by said prongs when in an operative position.

701,687. APPARATUS FOR PURGING SUGAR. Dr. GUENON DUBOIS, Bourges, France. Filed May 12, 1901. Serial No. 90,634. (No model.)

Claim.—1. Apparatus such as described, comprising a vacuum-pan having a channel open to said pan and to the atmosphere throughout its length, a foraminous partition in said channel to form a trough and means for educting liquid from the pan; in combination with a stationary feed device for feeding material to the trough and means for moving the pan progressively along said feed device, for the purpose set forth.

2. Apparatus such as described, comprising a vacuum-pan having a circular channel open to the pan and to the atmosphere throughout its

length, a foraminous partition in said channel to form a trough and means for educting liquid from the pan; in combination with a stationary feed-hopper above the aforesaid trough and means for rotating the pan, for the purpose set forth.

3. Apparatus such as described, comprising a vacuum pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel to form a trough, means for educting liquid from the pan and means for rotating the latter; in combination with means for continuously removing material from the trough and means for simultaneously and continuously feeding material to said trough so as not to relieve or materially relieve the vacuum in the pan, for the purpose set forth.

4. Apparatus such as described, comprising a vacuum-pan having a channel open to the atmosphere and to the pan throughout its length, a foraminous partition in said channel to form a trough, means for educting liquid from the pan and means for rotating the latter; in combination with a stationary interceptor arranged to remove material from the trough and means for taking up and conveying away said material, substantially as set forth.

5. Apparatus such as described, comprising a vacuum-pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel to form a trough, means for educting liquid from the pan and means for rotating the latter; in combination with a receiver, appliances automatically removing material from the trough into the receiver as the pan rotates, and means for simultaneously feeding fresh material to the trough at or substantially at the point of removal, for the purpose set forth.

6. Apparatus such as described, comprising a vacuum-pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel to form a trough, means for educting liquid from the pan and means for rotating the latter; in combination with a stationary interceptor constructed to intercept the material in the trough and direct it upwardly out of the same, a receiver, and a conveyor arranged to take the material banked up by the interceptor and convey it to said receiver, for the purpose set forth.

7. Apparatus such as described, comprising a vacuum-pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel to form a trough, means for educting liquid from the pan and means for rotating the latter; in combination with a stationary interceptor constructed to intercept the material in the trough and direct it upwardly out of the same, a receiver provided with stirring appliances, and a conveyor arranged to take the material banked up by the interceptor and convey it to said receiver, for the purpose set forth.

8. Apparatus such as described, comprising a stationary hollow column, a vacuum-pan mounted to revolve fluid-tight thereon, ports in said column near the bottom and top of the pan, a drain-pipe connected to the lower end of the column, an exhaust-pipe connected to the upper end of said column, said pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel to form a trough and means for rotating the pan; in combination with appliances for simultaneously removing material from and feeding material to said trough as the pan rotates and so as not to relieve or materially relieve the vacuum therein, for the purpose set forth.

9. In apparatus such as described, the combination with a rotatable vacuum-pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel open to the pan and to the atmosphere throughout its length, means for educting liquid from the pan, and means for rotating the latter; in combination with a stationary feed-hopper arranged to discharge into said trough and means for regulating the feed of material to the hopper, for the purpose set forth.

10. In apparatus such as described, the combination with a rotatable vacuum-pan having a circular channel open to the pan and to the atmosphere throughout its length, a foraminous partition in said channel open to the pan and to the atmosphere throughout its length, means for educting liquid from the pan and means for rotating the latter; in combination with a stationary feed-hopper arranged to discharge into said trough, means for regulating the feed of material to the trough, a scraper therein, in front of the hopper-outlet, arranged to remove material from said trough as the pan rotates, and means for conveying away the material so removed, for the purpose set forth.

701,688. VAULE. JAMES W. DOWELL, Evanston, Ill., assignor to Hall's Safe & Lock Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 9, 1901. Serial No. 74,005. (No model.)

Claim.—1. In a vault, the combination of flanged rails entering into the construction of the walls, corner-posts having flanges contacting with the bases, webs, and heads of the end rails of the two series of rails entering into the construction of contiguous walls, and means for securing said rails and posts together, substantially as described.

2. In a vault, the combination of flanged rails entering into the construction of the walls, corner-posts engaging the end rails of the two series of rails entering into the construction of contiguous walls, tie-rods passing through said rails and through openings in the posts, and nuts turned onto the tie-rods, substantially as described.

3. In a vault, the combination of flanged rails entering into the construction of the walls, hollow corner-posts engaging the end rails of the two series of rails entering into the construction of contiguous walls, tie-rods passing through said rails and the adjacent walls of the posts, and nuts within the posts, turned onto said tie-rods, substantially as described.

4. In a vault, the combination of flanged rails entering into the construction of the walls, hollow corner-posts engaging the end rails of the two series of rails entering into the construction of contiguous walls, tie-rods passing through said rails and the adjacent walls of the posts, and nuts, within the posts, turned onto said rods, the posts being provided opposite the nuts, with openings for the admission of a wrench, substantially as described.

5. In a vault, the combination of flanged rails entering into the construction of the walls, hollow corner-posts having flanges complementary in the flange of the end rails of the two series of rails entering into the construction of contiguous walls, tie-rods passing through said rails and the adjacent walls of the posts and nuts, within the posts, turned onto said rods, substantially as described.

6. A hollow post for use in vault construction having two flange ends

complementary to one side of the base, web and head of a flanged rail, substantially as described.

7. A hollow post for use in vault construction having two faces each complementary to the side of a flanged rail, and having, through said faces, openings for the passage of fastening devices and having, also, between said faces, openings for the admission of a wrench, substantially as described.

8. In a vault, the combination of a course of flanged rails arranged side by side, base to base, and entering into the construction of a wall, and keys disposed between adjacent rails, each of said keys engaging the base of one and the head of the next adjacent rail, substantially as described.

9. In a vault, the combination of flanged rails entering into the construction of a wall, and keys disposed between said rails, each key engaging the upper sides of the bases and the under sides of the heads of two adjacent rails, substantially as described.

10. In a vault, the combination of flanged rails entering into the construction of a wall, and keys disposed between said rails, each of said keys having parts engaging the under sides of the heads of two adjacent rails, and means through which said keys bear upon the tops of the heads of said rails, substantially as described.

11. In a vault, the combination of flanged rails entering into the construction of a wall, and keys disposed between said rails, each of said keys filling the space between the bases, webs and heads of two adjacent rails, substantially as described.

12. In a vault, the combination of flanged rails arranged side by side and entering into the construction of a wall, and means engaging adjacent rails for bracing each rail against lateral movement either inward or outward relatively to the next rail, said bracing means having engagement with both the top and the under sides of the heads of adjacent rails, substantially as described.

13. In a vault, the combination of flanged rails arranged side by side and entering into the construction of a wall, and means for bracing each rail against lateral movement either inward or outward relatively to the next rail, said bracing means having keys disposed between said rails, each of said keys having contact with the upper side of the base of one rail and the under side of the head of the next adjacent rail, substantially as described.

14. In a vault, the combination of flanged rails entering into the construction of the walls, and keys disposed between said rails and having parts engaging the upper sides of the bases and the under sides of the heads of adjacent rails, and means through which said keys bear upon the tops of the heads of said rails, substantially as described.

15. In a vault, the combination of flanged rails entering into the construction of the walls, and keys disposed between said rails and engaging the under sides of the heads of adjacent rails, said keys having cheeks extending between the heads of said adjacent rails, and means through which said cheeks bear upon the tops of the heads of said rails, substantially as described.

16. In a vault, the combination of flanged rails entering into the construction of the walls and arranged base to base, and keys disposed between said rails and having parts engaging the under sides of the heads of adjacent rails, cheeks extending between the heads of adjacent rails, and means through which the cheeks bear upon the tops of the heads of said rails, substantially as set forth.

17. In a vault, the combination of flanged rails arranged base to base, entering into the construction of the walls, and keys disposed between said rails and having parts engaging the under sides of the heads of adjacent rails, cheeks extending between the heads of said adjacent rails and means engaging the cheeks and bearing upon the tops of the rails, substantially as described.

18. In a vault, the combination of flanged rails, entering into the construction of the walls and keys disposed between said rails and engaging the under sides of the heads of said rails, said keys having heads complementary to the bases, webs and heads of the rails and cheeks extending between said heads, and means through which said cheeks bear upon the tops of the heads of said rails, substantially as described.

19. In a vault, the combination of flanged rails, entering into the construction of the walls, and keys disposed between said rails and engaging them, said keys having cheeks extending between said heads, hooks on said cheeks, and bars supported by the rails and engaged by said hooks, whereby the keys are supported substantially as set forth.

701,689. SUSPENDER-BUCKLE. WILLIAM T. DODGE, St. Joseph, Mo., assignor of one-half to Sam Black, St. Joseph, Mo. Filed Sept. 7, 1901. Serial No. 74,664. (No model.)

Claim.—1. A suspender buckle or clasp consisting of a loop, and a wedge independent thereof, the loop adapted to be held in a tight of the suspender-webbing, and the wedge having a slot whereby it may be at-

tached to the webbing to be confined within and protected upon both sides by said webbing, as set forth.

2. The combination with the webbing of a suspender, of a loop held in a tight of the webbing, and a wedge secured to the webbing and movable in the loop, said webbing passing between said wedge and said loop, as set forth.

3. The combination with the webbing, of a loop having one bar held within a tight of the webbing and the other bar forming a guide for the other portion of the webbing, and a wedge interposed between the main portion of the webbing and the looped portion thereof, as set forth.

4. A suspender having a loop secured in its webbing and the inner portion thereof covered thereby, the other portion forming a guide for the webbing, and a wedge secured to the webbing and movable between the portions of the webbing within the loop to firmly secure the webbing in its adjusted position, as set forth.

701,690. MANUFACTURE OF ARTIFICIAL SANDSTONE. EDWARD BROWNE, Herts, Germany. Filed Jan. 1, 1902. Serial No. 82,503. (No specimens.)

Claim.—1. The herein-described process for the manufacture of artificial sandstone comprising the agitation of pulverized slag under the action of high-pressure steam, adding thereto a material containing silicic acid, agitating again under the action of high-pressure steam, submitting the mixture in suitable molds to very high pressure, and finally drying the blocks thus formed.

2. The herein-described process for the manufacture of artificial sandstone comprising the agitation of pulverized slag under the action of high-pressure steam, adding thereto a material containing silicic acid, agitating again under the action of high-pressure steam, submitting the mixture in suitable molds to very high pressure, and finally drying the blocks thus formed by submitting for several hours to the action of high-pressure steam.

701,691. REPAIR-PLUG FOR BOILERS. CHARLES BOWENBARD, Edgemoor, N. J. Filed Feb. 24, 1902. Serial No. 82,505. (No model.)

Claim.—1. A repair-plug for boilers and tanks comprising a threaded central bolt forming an engagement with opening at its bottom, a rivet in the opening, two swiveling members secured loosely on the rivet and arranged one on each side of the bolt, a washer of water and steam resisting material, a metal plate above the washer, a nut above the plate and a sleeve with hemispherical incision integral with the nut, a flexible washer, a solid washer conforming to the shape of the incision, and a tightening top screw-nut.

2. In a repair-plug for boilers a threaded central bolt forming an engagement with opening at its bottom, a rivet in the opening, two swiveling members secured loosely on the rivet one on each side of the bolt, and means for securing the swiveling members when in position.

3. In a repair-plug for boilers a threaded central bolt and nut, a sleeve integral therewith, a hemispherical incision therein, a flexible washer, a solid washer conforming to the shape of the incision, and a top screw-nut.

4. In a repair-plug for boilers a central bolt, a rivet in its bottom portion, two wings loosely connected to the rivets one on each side of the bolt, a nut and sleeve, a hemispherical incision therein, a flexible washer, a solid washer conforming to the shape of the incision and a tightening top screw-nut.

701,692. CLOTHES-DRYER. HERBERT C. EVANS, Chicago, Ill., and JOHN F. EVANS, Montgomery, Mo. Filed Jan. 6, 1902. Serial No. 82,506. (No model.)

Claim.—1. A clothes-drier comprising a supporting-frame, provided with an adjustable inner portion adapted to be secured to a window, brackets, guide-bases mounted on said brackets, and a reel mounted on said guide-bases.

2. A clothes-drier comprising a supporting-frame, provided with an adjustable inner portion adapted to be secured to a window, brackets, guide-bars mounted on said brackets, a hanger adapted to slide on the guide-bars, a shaft secured to said hanger, and a reel mounted on said shaft.

701,693. METHOD OF HEATING MANDRELS FOR ROLLING TUBES. GEORGE H. EVINSON, Pittsburg, Pa. Filed Apr. 18, 1901. Serial No. 64,573. (No specimens.)

Claim.—1. The method of heating mandrels, preparatory to the rolling of tubes, without impairing their temper or their essentially smooth surface, consisting in maintaining the mandrels in a bath of heated water until the requisite degree of heat is attained.

2. The method of heating tube-rolling mandrels without impairing their temper or their essentially smooth surface, consisting in maintaining the mandrels in a bath of heated water until they attain the same degree of heat as the water.

3. The method of heating tube-rolling mandrels without impairing their temper or their essentially smooth surface, consisting in maintaining the mandrels in a bath of heated water until, from center to circumference, they attain the same degree of heat as the water.

701,694. MACHINE FOR DRILLING SPOKE-HOLES IN METALLIC WHEEL-FELLERS. GEORGE H. EVINSON, Pittsburg, Pa. Filed May 30, 1901. Serial No. 61,106. (No model.)

Claim.—1. In a drilling-machine, the combination of a frame, a circular series of heads 11 slidable horizontally therein and formed with inclined inner ends, a tapering device movable vertically and centrally through the series of slides and adapted to impinge the inclined inner-end surfaces thereof, a drill-check rotatably mounted in each slide, and means for rotating the checks, substantially as shown and described.

2. In a drilling-machine, the combination of an elevated bed-plate, drills and drill rotating and feeding mechanism supported at the upper end thereof, standards 8 positioned outwardly from the bed-plate, horizontal screw-shafts 31 journaled at their outer ends in said standards and at their inner ends provided with pinions, a bearing encircling the upper portion of the bed-plate, a large gear-wheel sustained by said bearing and meshing with said screw-shaft pinions, and work-supporting devices in engagement with and adapted to be adjusted by said screw-shafts, substantially as shown and described.

3. In a drilling-machine, the combination of a bed-plate having the upwardly-projecting tubular bearing 2, top frame portion 5 having the depending part 4 fitting bearing 2, drill-checks rotatable in the frame portion 5, a pinion on each check, a large gear-wheel mounted on bearing 2 and meshing with all of said pinions, and means for driving said gear, substantially as shown and described.

701,695. ELECTRIC IGNITER FOR EXPLOSION-ENGINE. HENRY H. FAHNEY, Chicago, Ill. Filed Sept. 19, 1900. Serial No. 29,596. (No model.)

Claim.—1. In an electric igniter the combination of the electrodes, means for separating the same, a friction-clutch having its driven member operatively related to one of said electrodes for bringing them together and closing the circuit therethrough, a positively-moving dog engaging the driving member of said clutch for rotating the same, a cam or trip for releasing said dog from said driving member, a slide to which said cam or trip is connected and means for adjustably covering said slide in place, substantially as set forth.

2. In an electric igniter the combination of two sets of electrodes, means for separating the electrodes of each set, two clutches having their driven members operatively related to one electrode of each of said sets for bringing them together and closing the circuits therethrough, means for positively moving the driving member of each of said clutches and adjustable means connected together so as to move in unison for rendering said clutch members inactive on the electrodes periodically, substantially as set forth.

3. In an electric igniter the combination of the electrodes one of which is movable, means for throwing said electrodes apart, a power-transmitting member having frictional operative relation to said movable electrode whereby it may continue to move after said electrode comes to rest and means for moving said member, substantially as set forth.

4. In an electric igniter the combination of the electrodes one of which is movable, means for throwing said electrodes apart, a power-transmitting member having permanent frictional operative relation to said movable electrode whereby said member may continue to move after said electrode comes to rest and means for intermittently moving said member, substantially as set forth.

5. In an electric igniter the combination of the electrodes one of which is movable, means for throwing said electrodes apart, a power-transmitting member having frictional operative relation to said movable electrode whereby said member may continue to move after said electrode comes to rest, means for engaging and moving said member, and means for tripping and releasing said engaging means, substantially as set forth.

6. In an electric igniter the combination of the electrodes one of which is movable, means for throwing said electrodes apart, a power-transmitting member having frictional operative relation to said movable electrode whereby said member may continue to move after said electrode comes to rest, means for engaging and moving said member and adjustable means for tripping and releasing said engaging means, substantially as set forth.

7. In an electric igniter the combination of the electrodes one of which is movable, a power-transmitting member having frictional operative relation to said movable electrode for forcing the latter electrode against the other electrode, means for intermittently moving said member and means for separating said electrodes offering less resistance than and adapted to be overcome by the friction of said power-transmitting member, substantially as set forth.

8. In an electric igniter the combination of the electrodes one of which is movable, a power-transmitting member rotatable continuously in one direction and having frictional operative relation to said movable electrode, means for intermittently moving said member and means for separating said electrodes offering less resistance than and adapted to be overcome by the friction of said power-transmitting member, substantially as set forth.

9. In an electric igniter the combination of two electrodes one of which is movable, a rotary power-transmitting member, a second member frictionally related to said first member and operatively connected with said movable electrode, means for engaging and rotating said first member until the electrodes meet, means for releasing said first member after the electrodes meet and means for throwing the electrodes apart, substantially as set forth.

10. In an electric igniter the combination of two electrodes one of which is movable, a shaft for operating said movable electrode, a rubber-arm loose on said shaft, a disk secured to said shaft, a second disk loose on said shaft and frictionally related to said first disk, a dog carried by said rubber-arm and adapted to engage said second disk, means for forcing said dog out of engagement with said second disk and means for

throwing the electrodes apart when said dog is then disengaged, substantially as set forth.

11. In an electric igniter the combination of two electrodes one of which is movable, a shaft for actuating said movable electrode in one direction, means for throwing said electrode in the opposite direction, a rocker-arm loose on said shaft, a disk secured to said shaft, a second disk loose on said shaft and frictionally related to said first disk, a dog carried by said arm and engaging said second disk for rotating it, a cam having a projection adjustable with reference to the circumference of said second disk and adapted to throw said dog out of engagement and means for adjusting said cam, substantially as set forth.

701,696. BICYCLE-SUPPORT. HENRY M. FAIRBANK, Rockland, Me. Filed Mar. 6, 1902. Serial No. 98,985. (No model.)

Claim.—1. In a device of the character described, the combination with a block, means for clamping it to a bicycle-frame, and a stop carried by said block, of a wheel-holder consisting of two arms pivoted to said block and adapted with their lower ends to grasp the steering-wheel and hold it against movement and having their upper ends screw-threaded, a bar having apertures through which the screw-threaded ends of said arms project and formed with screw-threaded sockets, into engaged with the said screw-threaded ends, and coasters or foot-rests having screw-threaded ends to engage the screw-threaded sockets, substantially as set forth.

2. In a device of the character described, the combination with a block, clamps hinged to said block and adapted to be clamped about the tube of a bicycle-frame, a stop secured to said clamps, of a wheel-holder consisting of two arms pivoted to said block and adapted with their lower ends to engage and hold the steering-wheel, a coupling for connecting the upper ends of said arms and for engaging the stop to limit the movement in one direction of the wheel-holder, substantially as set forth.

3. In a device of the character described, the combination with a block, clamps hinged to said block and adapted to be clamped about the tube of a bicycle-frame, a stop secured to said clamps, of a wheel-holder consisting of two arms pivoted to said block and adapted with their lower ends to engage and hold the steering-wheel, a coupling for connecting the upper ends of said arms and for engaging the stop to limit the movement in one direction of the wheel-holder, and coasters or foot-rests removably connected to the outer ends of said coupling, substantially as set forth.

4. In a device of the character described, the combination with a block adapted to be secured to the tube of a bicycle-frame and provided with a transverse aperture, of a pivotal pin inserted through said aperture and having its ends screw-threaded, sleeves having screw-threaded ends, the inner ends of said sleeves being screwed upon the ends of the pivotal pin, said sleeves being provided with vertical apertures, a wheel-holder comprising arms inserted through the apertures of the sleeves and adapted to grasp with their lower ends the steering-wheel and hold it against movement, said arms being inserted in the outer ends of the sleeves for clamping said arms to the sleeves, substantially as set forth.

5. In a device of the character described, the combination with a supporting-block and a hinge pivotally connected therewith and provided

with aligned guide-eyes, of an extensible prop-rod consisting of a tube or rod, a set-screw for clamping the rod to one of the guide-eyes and a set-screw for clamping the tube in adjusted position to the rod, substantially as set forth.

6. In a device of the character described, the combination with a supporting-block and a hinge pivotally connected therewith and provided with aligned guide-eyes, of an extensible prop-rod consisting of a tube or rod, a set-screw for clamping the tube in adjusted position to the rod, said tube being provided at its upper end with a stop-ring and said rod being provided at its lower end with a head adapted to engage the stop-ring and thus prevent the accidental withdrawal of the rod from the tube, substantially as set forth.

701,697. GRAPHOPHONE. BARK P. FINE, Albia, Minn., assignor of one-half to Charles Henry Miles, Bemidji, Minn. Filed July 15, 1901. Serial No. 68,764. (No model.)

Claim.—1. In a machine of the class set forth, the combination of a plurality of unitedly and individually rotatable record-holders, a carriage carrying a movably-mounted reproducer and also provided with a movable grip, a fixed screw-rod engaged by the carriage, a gravitating arm pivoted to the front portion of the carriage and operating to release the grip when elevated, a slide-rod cooperating with the reproducer to raise the latter and with which said arm has contact, a cord connected to said arm, a winding-drum for said cord, a motor for actuating the several parts including the said drum, and means for shipping and unshipping the said drum.

2. In a machine of the class set forth, the combination of a plurality of unitedly and individually rotatable record-holders, a carriage supporting a movably-mounted reproducer and provided with a movable grip, a fixed screw-rod for the carriage, a gravitating arm operative to release the grip, a slide-rod cooperating with the reproducer to raise the latter and with which said arm has contact, a motor for actuating the several parts, and means for automatically raising the arm, returning the carriage to a starting position after traveling its full limit over the several records, and permitting the arm to resume its normal position.

3. In a machine of the class set forth, the combination of a plurality of unitedly and individually rotatable record-holders, a carriage supporting a movably-mounted reproducer, a slide-rod cooperating with the reproducer to raise the latter, a pivoted arm adapted to engage the lower end of and move the said rod, a motor, and automatically-operating means for shifting the said arm to raise the reproducer and permit the rod to return to normal position during extreme opposite positions of the carriage.

4. A machine of the class set forth, comprising a plurality of unitedly and individually rotatable record-holders, a carriage having an automatically-movable reproducer, a motor for actuating the carriage and the holders, a drum-shaft operated by the motor and provided with a clutch device, a drum loosely mounted on the said shaft and adapted to be rotated with the latter by engagement with the clutch device, a resilient arm for moving the drum into engagement with the clutch device provided with a flexible connecting device running to the carriage, a resilient releasing-arm for the drum, a latch to engage said arm and a trip-rod carried by and movable with the carriage to engage said latch to release the arm and to push the releasing-arm to free the drum.

5. A machine of the class set forth, comprising a plurality of unitedly and individually rotatable record-holders, a carriage having an automatically-movable reproducer and a gravitating arm, a motor for actuating the carriage and the holders, a winding-drum adapted to be actuated by the motor and capable of being thrown into and out of operative engagement with the motor, resilient arms for moving the drum into and out of operative engagement with the motor, a flexible connection between the arm for moving the drum into operative engagement with the motor and the carriage, a cord between the arm of the carriage and the drum, a fixed screw-rod engaged by the carriage, a spring-actuated grip in the carriage,

the arm of the carriage operating when elevated to release the said grip and raise the reproducer, and a trip-valve secured to and movable with the carriage to release the drum from operative engagement with the motor.

6. In a reproducing-machine of the class set forth, the combination with a plurality of rotatable record-holders, of a motor operating a hand-pulley, a belt engaging the holders at one end and adapted to continuously rotate the same and also passing over said hand-pulley, a series of records adapted to be mounted on the holders, a reproducer, a carriage supporting the same, means for reciprocating the carriage to traverse the reproducer longitudinally of a record, means for returning the carriage to initial position, and means for stopping the records successively in such position as to permit of the actuation of the reproducer.

7. In a machine of the class set forth, the combination of a plurality of rotatable record-holders, a motor for actuating said holders, a screw feed-rod, a carriage movable over said feed-rod and having a pivoted spring-actuated grip to engage the latter, a gravitating arm mounted in the carriage and adapted to contact with a portion of the grip to release the latter a reproducer supported by the carriage, and means for automatically raising the arm when the carriage reaches its limit of movement in one direction and starts to return to an opposite extreme position.

8. In a machine of the class set forth, the combination of a plurality of rotatable record-holders, a carriage supporting a movable reproducer, a motor for actuating the holders and carriage, a disk carrying the holders and having outer projecting devices and notches, a spring-arm to engage the notches of the disk, a vertically-slidable pawl to engage the said projecting devices provided with a trip-finger to release said arm, a crank-lever connected to the pawl, and a shifting rod movable by the carriage and having one end loosely engaging the one extremity of the crank-lever.

9. In a machine of the class set forth, the combination of a plurality of rotatable record-holders, a carriage supporting a movable reproducer, a motor for actuating the holders and carriage, a vertically-slidable pawl for bringing the successive holders into operative position with relation to the reproducer, and a shifting rod engaged by a portion of the carriage and movable by the latter to impart reverse movements to the said pawl.

701,698. PRINTING-PRESS. GEORGE F. FISHER, New London Conn. Filed Aug. 20, 1901. Serial No. 72,672. (No model.)

Claim.—1. A type-bed having a rack, a set of ink-rollers having gears made to engage the rack, a second set of gears engaged by the ink-roller gears, a second rack engaged by the second set of gears, a third set of gears engaged by the second rack, and a second set of ink-rollers engaged by the third set of gears.

2. A reciprocating type-bed and ink-rollers driven by the bed, combined with a rack geared to the ink-rollers, and a second set of ink-rollers geared to the rack and disconnected from the bed, said rack being made to move at a different rate of speed from the bed substantially as described.

3. A type-bed having a rack, two sets of ink-rollers actuated by the rack, two sets of gears made to engage the ink-rollers, and a rack connected to said sets of gears substantially as described.

4. A type-bed and fountain and form-inking rollers, combined with a plurality of sets of gears, each set being mounted on a common shaft and made of varying sizes, and a rack, the fountain and form-inking rollers being engaged by the gears of the larger size, and the rack being engaged by the gears of the smaller size.

5. A type-bed having a rack and inking-rollers, combined with a plurality of sets of gears of different sizes, and a second rack free from the type-bed, one set of inking-rollers being engaged by the bed-rack, and a gear of large size, and the other set of inking-rollers being engaged by another gear of large size and being free from the bed-rack, and the second rack being made to transmit motion between the smaller gears, substantially as described.

6. A type-bed having a rack, ink-rollers geared to the rack, gears engaged by the ink-roller gears, a second set of ink-rollers, a second set of gears engaged to said second set of rollers, and a rack made to engage the two sets of gears substantially as described.

7. A type-bed having a rack, two sets of ink-rollers each provided with a set of gears one of which is engaged by the rack, gears engaged by the two sets of gears of the ink-rollers and provided with gears of smaller size, and a rack made to engage the smaller gears substantially as described.

701,699. PRINTING-MACHINE. JOSEPH L. FIRM, Chicago, Ill., assignor to The Gem Printing Press Company, Chicago, Ill. Filed Mar. 19, 1898. Serial No. 563,898. (No model.)

Claim.—1. In combination, a printing mechanism, two longitudinal folders U and V, two rotary carriers W and W' in axial alignment with each other and located in position to receive the paper from said longitudinal folders and adjustable means whereby said rotary carrier may be fixed together at various circumferential adjustments with respect to each other, substantially as described.

2. In combination, a printing mechanism, two longitudinal folders, the folding-rollers at the apices of said longitudinal folders, two rotary carriers in axial alignment and parallel with said folding-rollers and means whereby the circumferential position of said carriers may be adjusted relatively to each other, substantially as described.

701,700. DEVICE FOR FILING SAWS. JOHN E. L. FALKNER and HENRY A. W. FALKNER, Oakland, Cal. Filed Feb. 12, 1902. Serial No. 92,891. (No model.)

Claim.—1. A device for filing and sharpening saws consisting in the combination of a frame adapted to be rigidly secured to a support, a horizontal guide-bar against which the side portion of the saw is to be held, a filing-carriage straddling said saw and reciprocable along said guide and having oppositely-rotatable filing members adapted to engage the teeth of the saw, and a bar below the guide, parallel therewith and serving as a lateral support for the lower portion of the carriage.

2. A device for filing saws, consisting in the combination of a stationary frame having guides against which the saw is adapted to be held, a filing-carriage movable longitudinally of said frame, filing members adapted to engage the teeth of the saw and a chain-and-sprocket mechanism including sprockets on the outer ends of the filing members, a sprocket disposed in a plane below and between said first-named sprockets and a chain passing around both sets of sprockets by which said members are rotated.

3. A device for filing saws, consisting in the combination of a stationary frame, having a horizontal guide-bar against which the saw is adapted to be held, a filing-carriage reciprocable along and held to said guide, filing members adapted to engage the saw-teeth, and a chain-and-sprocket mechanism by which said members are rotated in opposite directions, said mechanism including a main power-wheel journaled in the lower portion and in the central vertical plane of the carriage, wheels fixed to the outer ends of the filing members, and an endless flexible connection passing around the power-wheel and the wheels on the filing members.

4. A device for filing saws, consisting in combination of a frame, a horizontal bar thereon, a longitudinal groove in said bar, a carriage straddling said bar, means upon the carriage engaging said groove, a second bar below and parallel with the grooved bar and serving as a lateral support for the forked portion of the carriage, independently-rotatable file members having helical abrading-surfaces, sprocket-wheels upon opposite sides of the carriage, other sprocket-wheels upon the shafts of said file members and a chain passing around and over said sprockets.

5. A device for filing saws, consisting in combination of a frame, a horizontal guide-bar thereon, having a longitudinal groove, a plate having a projection engaging said groove and slidable therein, a carriage supported on and movable with said plate and vertically adjustable in relation thereto, a bar below the guide-bar, parallel therewith and serving as a lateral support for the lower portion of the carriage, rotatable file members, and chain-and-sprocket mechanism by which said members are driven.

701,701. CONTROLLING DEVICE. THOMAS F. FORD, Rochester, N. Y. Filed Feb. 5, 1901. Serial No. 32,643. (No model.)

Claim.—1. A controlling device for dampers and other mechanisms, comprising a main cylinder, connected at one end with a fluid-pressure supply, a main piston reciprocating in the said main cylinder and connected with the mechanism to be controlled, an auxiliary cylinder con-

ried by the said main piston and extending within the inlet end of the said main cylinder and in communication therewith, and a spring-pressed auxiliary piston in the said auxiliary cylinder, controlling a passage from the inlet end of the main cylinder to the other end thereof, as set forth.

2. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a fluid-pressure supply, and a piston reciprocating in the said main cylinder, carrying an auxiliary cylinder having a port connection with the said main cylinder, an auxiliary piston in the said auxiliary cylinder, pressed on at one side by a spring and at its other side by the fluid-pressure passing into the main cylinder and means controlled by the said auxiliary piston to govern the passage of the fluid-pressure from the inlet end of the main cylinder to the other end thereof, as set forth.

3. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a fluid-pressure supply, and a piston reciprocating in the said main cylinder, carrying an auxiliary cylinder having a port connection with the said main cylinder, and an auxiliary piston in the said auxiliary cylinder, pressed on at one side by a spring and at its other side by the fluid-pressure passing into the main cylinder, the said auxiliary piston carrying means controlling the admission of the fluid-pressure to the other end of the main cylinder, as set forth.

4. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a fluid-pressure supply, a piston reciprocating in the said main cylinder, carrying an auxiliary cylinder having a port connection with the said main cylinder, and an auxiliary piston in the said auxiliary cylinder, pressed on at one side by a spring and at its other side by the fluid-pressure passing into the main cylinder, and the said auxiliary piston carrying means controlling the exhaust of the motive agent from the main cylinder, as set forth.

5. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a fluid-pressure supply, and a piston reciprocating in the said main cylinder, carrying an auxiliary cylinder having a port connection with the said main cylinder, and an auxiliary piston in the said auxiliary cylinder, pressed on at one side by a spring and at its other side by the fluid-pressure passing into the main cylinder, the said auxiliary piston carrying means controlling the admission and exhaust of the fluid-pressure to and from the other end of the cylinder, as set forth.

6. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a motive-agent supply, a main piston reciprocating in the said cylinder and supporting an auxiliary cylinder having a port connection with the said main cylinder, an auxiliary piston in the auxiliary cylinder, a spring pressing one side of the said auxiliary piston, the other side being pressed on by fluid-pressure passing from the main cylinder into the auxiliary cylinder, and a valve carried by the said auxiliary piston and controlling the connection between the auxiliary cylinder and the other end of the main cylinder, as set forth.

7. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a motive-agent supply, a main piston reciprocating in the said cylinder and supporting an

auxiliary cylinder having a port connection with the said main cylinder, an auxiliary piston in the auxiliary cylinder, a spring pressing one side of the said auxiliary piston, the other side being pressed on by fluid-pressure passing from the main cylinder into the auxiliary cylinder, a valve carried by the said auxiliary piston and controlling the connection between the auxiliary cylinder and the other end of the main cylinder, and a second valve controlled by the said auxiliary piston for controlling the exhaust from the main cylinder, as set forth.

8. A controlling device comprising a main piston, an auxiliary piston, the auxiliary piston moving bodily with the main piston and having movement independent thereof, the auxiliary piston being spring-pressed at one side and pressed on at the other side by the fluid-pressure controlling the main piston, and a fluid-pressure connection with the said auxiliary piston to reinforce its spring, as set forth.

9. A controlling device for dampers and other mechanisms, comprising a main cylinder connected at one end with a fluid-pressure supply, a piston reciprocating in the said cylinder and carrying an auxiliary cylinder having a port connection with the said main cylinder, an auxiliary piston in the said auxiliary cylinder, pressed on at one side by a spring and at its other side by the fluid-pressure passing into the main cylinder, and means controlled by the said auxiliary piston to govern the passage of the steam from the inlet end of the main cylinder to the other end thereof, the said means also controlling the exhaust of the fluid-pressure from the exhaust end of the said main cylinder, as set forth.

701,702. CULINARY SIFTER OR STRAINER. JAMES F. POTTER and ARTHUR F. FERRIS, Buffalo, N. Y., assignors to Sidney Shepard and Company, Buffalo, N. Y. Filed Sept. 28, 1901. Serial No. 70,590. (No model.)

Claim.—1. In a sifter or strainer, the combination of a dish having a flared bottom, an upright shaft removably journaled in the dish and carrying an agitator which sweeps over the bottom of the dish, and a foldable stay-frame for the shaft removably attached to the dish and composed of radial arms having their inner ends connected to the shaft and provided at their outer ends with attachments constructed to engage with the rim of the dish, substantially as set forth.

2. In a sifter or strainer, the combination of a dish having a flared bottom, an upright shaft removably journaled in the dish and carrying an agitator, and a removable stay-frame for the shaft composed of foldable arms provided at their inner ends with eyes which loosely encircle the shaft and at their outer ends with hooks which embrace the rim of the dish, substantially as set forth.

3. In a sifter or strainer, an agitator and its operating-shaft bent from a single piece of wire and comprising upper and lower shaft-sections, a continuous agitator-bar extending across the lower shaft-section, a connecting-bar extending from one end of said agitator-bar to the lower end of the upper shaft-section, and a similar connecting-bar extending from the opposite end of said agitator-bar to the upper end of the lower shaft-section, substantially as set forth.

4. In a sifter or strainer, the combination of an upright shaft provided at its upper end with a crank and at its lower end with an agitator arranged in the plane of the said crank, and folding arms or stays pivoted at their inner ends to said shaft and provided at their outer ends with attachments constructed to engage over the rim of the sifter or strainer, substantially as set forth.

701,703. FASTENER FOR HOSE-COUPLES. CHARLES FRANKLIN, Ontario, Cal. Filed Aug. 14, 1901. Serial No. 72,041. (No model.)

Claim.—The fastener consisting of a metallic strip or band of sufficient length to encircle a flexible pipe or hose whereinto a coupling is

to be fastened, and having a closed loop at each end thereof, which loops when said fastener is bent around the flexible pipe or hose to be coupled are superposed, so as to admit of a sufficiently stout piece of wire or rod being passed through said loops or eyes, whereby, on twisting said wire or rod, the under portions of the fastener become twisted and tightened upon each other to any extent requisite for securely holding a coupling within the end of a flexible pipe or hose in the manner and for the purpose substantially as hereinbefore described.

701,704. GAS-PURIFIER. DELBERT S. FERRIS, Binghamton, N. Y., assignor of one-half to the Rex Acetylene Generator Company, Binghamton, N. Y., a Corporation of New York. Filed Oct. 12, 1901. Serial No. 70,678. (No model.)

Claim.—1. A gas-purifying apparatus comprising a cylinder, inlet and outlet pipes communicating with the cylinder, a screen within the cylinder, means for supporting said screen above the bottom of the cylinder consisting of a ring depending therefrom and longitudinally slitted to form a flap, said flap bent inward and upward beneath the screen to provide a guard for the outlet.

2. A gas-purifying apparatus comprising a cylinder, inlet and outlet pipes communicating with the cylinder, a screen within the cylinder, and means for supporting said screen above the bottom of the cylinder consisting of a ring depending therefrom and longitudinally slitted to provide a guard for the outlet.

701,705. WHEEL. SAMUEL FURNISS, St. Louis, Mo., assignor to the Furniss Spring Wheel Company, Pierre, S. D., a Corporation. Filed Jan. 2, 1902. Serial No. 81,000. (No model.)

Claim.—1. A hub having notches extending from the periphery toward the center thereof and terminating in pockets at their inner ends, and spokes springingly fitted in said notches and pockets; whereby the spokes are movably connected to the hub, substantially as set forth.

2. In a wheel the combination of a rim, spring-spokes loosely connected to said rim, and a hub provided with inwardly-narrowing notches in which said spokes are loosely seated and adapted to play, substantially as set forth.

3. In a wheel, the combination of a rim, spring-spokes loosely connected to said rim, and a hub provided with V-shaped notches terminating at their inner ends in curved pockets in which said spokes are loosely seated and adapted to play, substantially as set forth.

4. In a wheel, the combination of a hub provided with V-shaped notches terminating at their inner ends in curved pockets, spokes having enlarged inner ends seated in said pockets and adapted to play in said notches, and a rim to which the outer ends of said spokes are loosely connected, substantially as described.

5. In a wheel, the combination of a hub, provided with notches terminating at their inner ends in pockets and open at the ends of the hub, spokes having enlarged inner ends loosely seated in said notches and pockets, and caps applied to said hub, and a rim to which the outer ends of said spokes are loosely connected, substantially as described.

6. In a wheel, the combination of a hub provided with V-shaped notches terminating at their inner ends in curved pockets, spokes having eyes at their inner ends seated in said pockets and adapted to play in said

notches, and caps fitted to the ends of said hub, pins seated in said end caps and hubs, and passing through the eyes of said spokes, and a rim to which the outer ends of said spokes are loosely connected, substantially as described.

7. As a new article of manufacture, a spring-spoke having a narrow central portion and widened ends, substantially as described.

8. As a new article of manufacture, a spoke having a narrow central portion and widened ends, and provided at its ends with eyes, substantially as described.

701,706. PAUL. FRANK J. GARVEY, Chicago, Ill. Filed Oct. 2, 1901. Serial No. 77,312. (No model.)

Claim.—1. In a pul or the like, in combination, a drum having a deep cross therein forming a relatively thin elastic neck, a chime above the cross of less thickness than the drum below the cross, said chime having a bevel extending from the upper wall of the cross and forming an acute-angled shoulder therewith, and a head having a chamber engaged by the apex of the shoulder.

2. In a pul or the like, in combination, a drum having a cross of sufficient depth to form an elastic neck, the lower wall of the cross extending inwardly beyond the upper, whereby an inwardly-extending ledge is formed, a chime having a bevel extending from the upper wall of the cross and forming an acute-angled shoulder therewith, and a head the lower surface of which rests flatly upon said ledge forming a wide joint therewith, and the upper surface of which has a chamber engaged by the apex of the shoulder, the said neck being spaced from the edge of the head within the cross so that a constant pressure is exerted by the neck to bind the head against the ledge.

701,707. PROCESS OF PRODUCING SILICA BRICKS. WINFIELD H. GIBSON, Homestead, and HENRY WIMLING, Hopeworth, Pa. Filed Dec. 17, 1900. Serial No. 40,180. (No specimens.)

Claim.—1. The herein-described method or process of producing refractory brick or fireproof material consisting in mixing substantially pure coarsely crushed or ground silica with substantially pure silica reduced to a fine or impalpable powder, then drying and burning the same.

2. The herein-described method or process of producing refractory brick or fireproof material consisting in mixing substantially pure coarsely crushed or ground silica with substantially pure silica reduced to a fine or impalpable powder in the proportions of forty (40) parts of the coarse material mixed and commingled with one (1) part of the powdered material, then drying and burning the same.

701,708. SILICA BRICK. WINFIELD H. GIBSON, Homestead, and HENRY WIMLING, Hopeworth, Pa. Filed May 20, 1901. Serial No. 62,422. (Specimens.)

Claim.—1. As a new article of manufacture, a refractory brick or fireproof material composed of substantially pure silica substantially free from lime and alkaline-metal silicates, and being substantially non-porous and of relatively great density.

2. A refractory brick or fireproof material composed of substantially pure silica substantially free from lime and alkaline-metal silicates and having a porosity of substantially 0.21 per cent. and a density or specific gravity of substantially 2.31.

701,709. SPINNING-SPINDLE. WILLIAM GIBSON, Chicago, Mass., assignor of one-half to May A. Ramick, Augusta, Me. Filed Sept. 12, 1901. Serial No. 70,104. (No model.)

Claim.—1. In a spindle, a base-support provided with a lubricating-chamber, a spindle an end of which extends within the chamber and is provided with a rounded terminal and an exterior spiral groove extending up from the rounded terminal, a plug for an end of the lubricating-chamber, a tubular bearing within the lubricating-chamber provided with a shank which enters the said plug, the tubular bearing being open at the top and having opposing side openings, and a pin adjustable in said opening, having a flat upper surface which receives the rounded terminal of the spindle, whereby the support for the spindle is at all times surrounded by a lubricating material and said support may be shifted as it becomes worn, as described.

2. In a spindle, a device for closing an end of a lubricating-chamber and supporting a spindle, which consists of a plug having an interior chamber, a tubular bearing open at the top and provided with a shank fitted to the chamber in the plug, the said tubular bearing having opposing openings therein, and a pin adapted to support an end of a spindle, which pin is loosely passed through the openings for endwise adjustment therein, said pin having a flat upper surface and a cylindrical lower surface, as described.

701,710. TIRE-HEATER. SILAS GLEASER, Cooper, Wyo. Filed Nov. 10, 1901. Serial No. 22,268. (No model.)

Claim.—1. In a tire-heater, the combination with annular burners disposed one within the other and discharging toward each other, of a fender adapted to be moved through the space between said burners, and to be disposed between them, said fender having means to carry the tire, substantially as described.

2. The combination with a tire-heater having annularly-disposed con-

centrically-arranged burners discharging toward each other, of a fender movable between said burners, for the purpose set forth, said fender being adapted to carry the tire, and moving out of the interspace between said burners when the tire is disposed between them, substantially as described.

3. The combination with a tire-heater having annularly-disposed concentrically-arranged burners discharging toward each other, of a fender adapted to carry a tire, and yielding means to dispose the fender when unloaded, in the space between said burners, substantially as described.

4. The combination with a tire-heater having burners discharging toward each other, of a yieldably-supported fender adapted to carry the work, said fender when unloaded, being disposed between the burners and when loaded supporting the work, between the burners, substantially as described.

5. The combination with a heater having burners disposed opposite and discharging toward each other, of a fender movable to and from the space between the burners, and counterbalancing means to support said fender, substantially as described.

6. The combination with a heater having burners disposed opposite and discharging toward each other, of a circular fender adapted to move to and from the space between said burners, said fender being adapted to carry the tire, a support arm pivoted thereto and connected to said fender, and weights to raise and support said arm and fender, substantially as described.

7. The combination with a tire-heater having concentrically-disposed burners discharging toward each other, of a circular fender adapted to move to and from the space between said burners, said fender being adapted to carry the tire, a support arm pivoted thereto and connected to said fender, and weights to raise and support said arm and fender, substantially as described.

701,711. ATOMIZER. HERMAN GOLDBERGER, New York, N. Y. Filed May 10, 1901. Serial No. 50,605. (No model.)

Claim.—The combination of a vessel containing liquid to be atomized, a cap for said vessel, an air-tube connected with said cap, means for supplying air under pressure to said vessel and air-tube, said air-tube having a contracted and interiorly-threaded outer end, a nozzle-tube located in the air-tube and provided at its outer end with a screw-thread engaging the contracted portion of the air-tube, and with flattened sides between the nozzle and air tubes at their outer ends, said air-tube being provided with two exteriorly-threaded shoulders of different size, the smaller in front, a nozzle of less diameter than the larger shoulder secured upon the smaller shoulder, said nozzle being provided with a metallic perforated cap, and an auxiliary nozzle secured upon said larger shoulder and including the smaller nozzle, substantially as set forth.

701,712. CORN-PLANTER. LEVI F. GRASMAN, DOVER, Ill. Filed Oct. 11, 1901. Serial No. 73,282. (No model.)

Claim.—1. A seed-disk having cells each adapted to receive a single grain of corn, the cells being grouped in accordance with the number of grains required in a hill and the distance between the cells of a group.

2. In a convertible check-row and drill planter, the combination of a hollow shank, a seed-exPELLING plunger in the shank, a valve-plate pivoted in the rear part of the shank with its lower end normally closing against the front wall of the shank below the plunger when the plunger is raised, and means for holding the valve-plate out of contact with the plunger and the front wall of the shank to convert the planter into a drill.

3. In a convertible check-row and drill planter, the combination of a hollow shank, a seed-exPELLING plunger in the shank, a valve-plate pivoted in the rear part of the shank with its lower end normally closing against the front wall of the shank below the plunger when the plunger

is raised, an inward extension on the valve normally closing against the lower end of the plunger when the plunger is raised, and means for holding the valve-plate out of contact with the plunger and the front wall of the shank to convert the planter into a drill.

4. In a convertible check-row and drill planter, the combination of a hollow shank, a seed-exPELLING plunger in the shank, a valve-plate pivoted in the rear part of the shank, means for holding the lower end of the valve-plate in position to coast with the plunger in retaining the seed and discharging it at intervals, and means for holding the valve-plate clear of the seed-exPELLING plunger while drilling the seed.

5. In a second drop for planter, the combination of a hollow shank, a seed-exPELLING plunger in the front part of the shank, a valve-plate in the shank in the rear of the plunger, a dotted cross-bar on the rear of the shank in the rear of the valve-plate, a rod pivotedly connected with the valve-plate and adapted to rest in the slot of the cross-bar, a head on the extended end of the rod, and a spiral spring on the rod adapted to fit between the cross-bar and the valve-plate to hold the plate in cooperation with the plunger, or between the head of the rod and the cross-bar to hold the plate out of contact with the plunger.

6. In a convertible check-row planter and drill, the combination of seed-dropping mechanism, a rock-shaft to actuate the seed-dropping mechanism, an arm on the rock-shaft, a potential-energy appliance exerting stored force lengthwise of the arm when the shaft is rocked forward in check-rowing, and means for shifting the stress of the potential-energy appliance to prevent the formation of a dead-center lock when the planter is used as a drill.

7. In a planter, the combination of seed-dropping mechanism, a rock-shaft to actuate the seed-dropping mechanism, an arm on the rock-shaft, a bent link connecting with the arm, a shiftable support for the extended end of the link, and a spring connected with the link.

8. In a planter, the combination of a rock-shaft, planting mechanism actuated by the rock-shaft, a wheel journaled on the rock-shaft, means for retaining the wheel, a catch on the rock-shaft adapted to engage the wheel, a throw-out to disengage the catch from the wheel at the termination of the motion of the rock-shaft in one direction, and means for rocking the shaft in the contrary direction.

9. In a planter, the combination of a rock-shaft, planting mechanism actuated by the rock-shaft, a wheel journaled on the rock-shaft, means for retaining the wheel, a catch on the rock-shaft adapted to engage the wheel, a throw-out to disengage the catch from the wheel at the termination of the motion of the rock-shaft in one direction, means for rocking the shaft in the contrary direction, and a yielding pressure to hold the catch out of engagement with the wheel while the shaft is rocking backward.

10. In a planter, the combination of a rock-shaft, planting mechanism actuated by the rock-shaft, a wheel journaled on the rock-shaft, means for retaining the wheel, a throw-out to disengage the catch from the wheel at the termination of the motion of the rock-shaft in one direction, an arm on the rock-shaft, a spring exerting pressure lengthwise of the arm when the throw-out acts on the catch, and means for giving the rock-shaft initial reverse motion to break the dead-center lock established by the potential force of the spring and the arm.

11. In a planter, the combination of a seed-plate having cells each adapted to hold a single grain of corn, a rock-shaft adapted to impart intermittent rotary motion in one direction to the seed-plate and discharge a plurality of grains consecutively at each forward rock, and means for

giving the rock-shaft a comparatively slow forward movement and a quicker return.

701,713. MANUFACTURE OF ELECTRICALLY-INSULATING AND WATERPROOFING MATERIALS. FREDERICK GREENUP, Flims-stand Common, England, assignor to Frederick Henry Bowden, London, England, and Sydney Herbert Dodd, Blackheath, England. Filed Dec. 6, 1900. Serial No. 33,857. (No specimens.)

Claim.—1. The herein-described process for the manufacture of an electrically-insulating and waterproofing material, consisting in mixing with fused anthracene a proportion of a copal resin.

2. As a new product, the electrically-insulating and waterproofing material produced by combining anthracene with a copal resin.

701,714. PEDAL ATTACHMENT. RUSSELL COOK, Brooklyn, Tex. Filed Jan. 16, 1901. Serial No. 33,905. (No model.)

Claim.—1. A pedal attachment for piano, consisting of a flat spring having one end upwardly bent and recessed at the end edge thereof to engage the bottom and sides of the pedal-shank, and having an aperture at its opposite end, substantially as set forth.

2. The combination, with a pedal and a recess in the bottom of the casing of an instrument provided with pedals, of a spring having a shank which is attached at one end in said recess and having the up-bent end thereof retained in contact with the under side of said pedal, substantially as set forth.

3. In a piano having pedal-openings in the casing thereof, the combination, with the pedals, of auxiliary springs for said pedals arranged below the same and being secured to the under side of said casing, the outer ends of said springs being bent upwardly and recessed to engage with said pedals, said upwardly-bent ends being arranged exteriorly of and adjacent the front of said casing and covering said pedal-openings, substantially as set forth.

701,715. MACHINE FOR SHAPING AND SMOOTHING COLLARS OR LIKE ARTICLES. AXEL R. GUNTERSON, Chicago, Ill., assignor to Electric Laundry Machinery Co., Chicago, Ill., a Corporation of Illinois. Filed Oct. 15, 1900. Serial No. 33,933. (No model.)

Claim.—1. In a machine for the purpose described the combination of a heated member, a friction-roller and a guide-roller arranged contiguous to said heated member and adapted to press the article to be treated against said heated member and advance said article past the same, on an annular support adapted to fit within the folds of the article to be treated, a shaft upon which said support is mounted operatively connected with said rollers, means for rotating said support and a smoothing-iron having a groove adapted to fit over the edge of said support, substantially as set forth.

2. In a machine for the purpose described the combination of a reversible ring or support for the article to be treated, a heated member placed concentrically with said ring or support, an iron supported in connection with said heated member and having a groove adapted to be depressed over said ring, a reversible iron having a groove for smoothing the edge of the article to be treated, arranged contiguous to and to receive the heat from said heated member, reversible rollers arranged contiguous to said heated member for guiding the article to be treated thereagainst, a driving-shaft and a train of gears connecting together said reversible iron, rollers and reversible ring, having one of its gear-wheels arranged concentrically with said ring and the pivot of said heated member, whereby said heated member may be adjusted around said ring without disconnecting the gears, substantially as set forth.

3. In a machine for the purpose described the combination of a rotating iron, a friction-roller, a guide-roller arranged adjacent to said friction-roller and a heated member presenting a smoothing-surface to said guide and friction rollers and also arranged contiguous to and heating said rotary iron so that the said heated member will be common to both said iron and rollers and serve the twofold function of acting as a heating and smoothing-surface for said rollers and a heater for said rotary iron, and means for rotating said iron while in operative relation to said heated member, substantially as set forth.

4. In a machine for the purpose described the combination of a heated member, two rollers arranged adjacent thereto and adapted to press the article to be treated thereagainst, means for driving one of said rollers, a rotary iron arranged adjacent to and heated by said heated member and means for operatively connecting one of said rollers with said rotary iron whereby said roller will serve the twofold purpose of a shaft for rotating said iron and pressing the article to be treated against said heated member, substantially as set forth.

701,716. MACHINE FOR SHAPING COLLARS OR OTHER LIKE ARTICLES. AXEL R. GUNTERSON, Chicago, Ill., assignor to Electric Laundry Machinery Co., Chicago, Ill., a Corporation of Illinois. Filed May 13, 1901. Serial No. 33,932. (No model.)

Claim.—In a machine for the purpose described the combination of a heated member having a projecting V-shaped tongue formed longitudinally on the surface thereof and provided with concave sides, a friction-roller arranged to conform to one of said concave sides and a guide member arranged contiguous to said friction-roller and opposite the other of said concave sides, substantially as set forth.

701,717. SHEET-METAL BUTTON AND BLANK THEREFOR. JAMES HAYES, JR., Augusta, Ky. Filed Aug. 23, 1901. Serial No. 73,080. (No model.)

Claim.—1. A sheet-metal button having pointed attaching-prongs, a head from the under side of which they project, each head being broader than the width of the prongs, which additional width is obtained by splitting, separating and spreading the split metal thereat.

2. A button made from a blank of sheet metal in the shape of an elongated rhomb, the points of which form attaching-prongs, being bent substantially at right angles to the central portion of the blank which is split and laterally spread to form the head.

3. A blank for a sheet-metal button, being in the shape of an elongated rhomb, the center portion of which is split and then laterally enlarged to form the head and the pointed end portions of which are adapted to form attaching-prongs after being bent substantially at right angles to the center portion which forms the head.

701,718. PAINT. CHARLES H. HALL, Niagara Falls, N. Y. Filed Jan. 13, 1901. Serial No. 33,933. (No specimens.)

Claim.—1. As a new article of manufacture, paint pigment composed of finely-pulverized metallic alloy containing iron with a sufficient

proportion of a more electropositive element or elements to render the alloy easily pulverized.

2. As a new article of manufacture, paint pigment composed of finely-pulverized metallic alloy containing iron with a sufficient proportion of a more electropositive element or elements to render the alloy easily pulverized, each powdered material being mixed with oil.

3. A paint pigment composed of an easily-pulverized alloy of iron containing silicon, each metallic alloy being finely pulverized.

4. A paint pigment composed of an easily-pulverized alloy of iron containing silicon and titanium, each metallic alloy being finely pulverized.

701,719. LATHE-TURRET STOP. EDWIN H. W. HARRIS, Hartford, Conn., assignor to the Pratt & Whitney Company, Hartford, Conn. Filed Dec. 2, 1901. Serial No. 94,239. (No model.)

Claim.—1. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and power mechanism for feeding the slide along the bed, of a series of endwise-movable parallel stop-rods supported by the lathe-bed independent of the turret-slide, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of and move any one of said rods, a cam turning in unison with the turret and adapted to swing said arm to position corresponding with the angular adjustment of the turret, a feed-release device, and mechanism connecting said endwise-movable stop-rods and feed-release device to cause the latter to release by the endwise movement of any of said stop-rods.

2. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and power mechanism for feeding the slide along the bed, of a series of endwise-movable longitudinally-adjustable parallel stop-rods supported by the lathe-bed independent of the turret-slide, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of and move any one of said rods, a cam turning in unison with the turret and adapted to swing said arm to position corresponding with the angular adjustment of the turret, a feed-release device, and mechanism connecting said stop-rods and feed-release device and causing it to release the latter upon the endwise movement of any of the stop-rods.

3. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and power mechanism for feeding the slide along the bed, of a series of endwise-movable parallel stop-rods supported by the lathe-bed independent of the turret-slide, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of and move any one of said rods, a cam upon the turret and adapted to swing said arm to position corresponding with the angular adjustment of the turret, a feed-release device, and mechanism connecting

said feed-release device and stop-rods to cause the former to be actuated upon the endwise movement of any of said stop-rods.

4. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the slide along the bed, of a block supported by and adapted for longitudinal sliding motion on the lathe-bed, a series of parallel stop-rods carried by said block, a trip-rod carried by said block and adapted as it moves endwise to trip and release the power feed mechanism, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of any one of said rods, and a cam turning in unison with the turret and adapted to swing said arm to position corresponding with the angular adjustment of the turret.

5. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the slide along the bed, of a block supported by and adapted for longitudinal sliding motion on the lathe-bed, a longitudinally-adjustable series of parallel stop-rods carried by said block, a trip-rod carried by said block and adapted as it moves endwise to trip and release the power feed mechanism, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of any one of said rods, and a cam turning in unison with the turret and adapted to swing said arm to position corresponding with the angular adjustment of the turret.

6. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the slide along the bed, of a block supported by and adapted for longitudinal sliding motion on the lathe-bed, a series of parallel stop-rods carried by said block, a trip-rod carried by said block and longitudinally adjustable therein and adapted as it moves endwise to trip and release the power feed mechanism, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of any one of said rods, a cam turning in unison with the turret and adapted to swing said arm to position corresponding with the angular adjustment of the turret, and a bracket longitudinally adjustable along the lathe-bed and furnishing the slide-bearing for said block.

7. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and power mechanism for feeding the slide along the bed, of a series of parallel stop-rods supported by the lathe-bed, an arm carried by the turret-slide upon an axis at right angles to that of the turret and adapted to be swung into position to engage the tail end of any one of said rods, a cam formed upon the turret, a cam-arm connected with the first-mentioned arm, a roll-carrier pivoted to the cam-arm on an axis at right angles to that of the turret, a roll mounted in said roll-carrier on an axis at right angles to that of the cam-arm and engaging said cam, and a feed-release device actuated upon the engagement of the first-mentioned arm with one of said stop-rods.

8. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and a feed-shaft, of a worm-wheel connected with the feed-shaft, a dropping worm-box, a worm therein, a lever connected with the worm-box, a latch carried by said lever, a sliding block supported by the lathe-bed, a trip-rod connected with said block and adapted to engage said latch, a series of parallel stop-rods carried by said block, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of any one of said stop-rods, and a cam turning in unison with the turret and cooperating with said arm to cause the same to swing to position corresponding with the angular adjustment of the turret.

9. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and a feed-shaft, of a worm-wheel connected with the feed-shaft, a dropping worm-box, a worm therein, a lever connected with the worm-box, a latch carried by said lever, a sliding block supported by the lathe-bed, a trip-rod connected with said block and adapted to engage said latch, a spring urging said trip-rod in the latch-engaging direction, a stop to limit the motion of the trip-rod in the disengaging direction, a series of parallel stop-rods carried by said block, an arm carried by the turret-slide and adapted to be swung into position to engage the tail end of any one of said stop-rods, and a cam turning in unison with the turret and cooperating with said arm to cause the same to swing to position corresponding with the angular adjustment of the turret.

10. In a turret-lathe, the combination, substantially as set forth, with a lathe-bed, a turret-slide, a turret, and releasable power mechanism for feeding the slide along the bed, of a feed-releasing part, a hand-latch carried thereby, an endwise-moving trip-rod supported by the bed and adapted to engage said latch and hold the feed in action, and provision for causing said trip-rod to be moved in released direction by the advancing turret-slide, whereby the engagement of the latch and the trip-rod may be suppressed either by the hand movement of the latch or by the mechanical movement of the trip-rod.

11. In a turret-lathe, the combination, substantially as set forth, of a lathe-bed, a turret-slide mounted thereon, a turret mounted for rotation

upon the turret-slide and provided with a central bore counterbored from above, a pinion firmly secured in the turret-slide and fitting the lower portion of the bore of the turret and having a shoulder engaging the floor of the counterbore in the turret, a binding-screw projecting from the pinion to a point above the turret, a washer on said screw over the turret, and a binding-nut upon said screw over the washer.

12. In a turret-lathe, the combination, substantially as set forth, of a lathe-bed, a turret-slide mounted thereon, a turret mounted for rotation upon the turret-slide and provided with radial tool-sockets arranged in pairs so that the axis of one socket will be in alignment with the axis of the opposite socket, the turret having an axial bore counterbored from above to a diameter greater than that of said tool-sockets, a pinion firmly secured in said turret-slide and fitting the lower portion of the bore of the turret and having a body smaller than said counterbore and provided with a shoulder engaging the floor of the counterbore in the turret and provided with a transverse opening with its axis in the common plane of all the tool-sockets, a binding-screw projecting from said pinion to a point above the turret, a washer on said screw over the turret, and a binding-nut upon said screw over the washer.

701,730. METALLIC-FRAME BOX-CAR. JOHN H. HAMMER, Pittsburgh, Pa., assignor to Pressed Steel Car Company, Pittsburgh, Pa., a Corporation of New Jersey. Filed July 26, 1901. Renewed Apr. 11, 1902. Serial No. 162,472. (No model.)

Claim.—1. A skeleton frame for car-bodies, having side and end sills, side and end plates, hollow, vertical posts secured to the sills and plates, and adapted to receive wooden nailing-strips, oblique braces interposed between the posts, sills and plates, and transverse girds secured to the posts and braces, said girds having flat portions at their points of intersection with the posts and braces and said posts, braces and girds terminating in flat ends.

2. A metal car-frame, having ends comprising essentially sills and plates, right-angle corner-posts, an intermediate vertical post, and oblique braces diverging upwardly from the foot of the intermediate post, the said intermediate post and braces being of substantially U shape in cross-section, with flat ends and secured to the said end sills and plates by riveting through such flat ends.

3. In a car-frame, an end having a central, vertical, hollow post, and oblique braces of similar construction, the upper ends of the said post and braces being flat and the lower ends being substantially horizontal, the said several ends being rigidly secured in place.

4. A metal frame for car-bodies, composed essentially of hollow, vertical posts, hollow diagonal braces, and transverse girds of channel cross-section, with flat portions at the points of intersection with the posts

and braces and riveted at such points and through such flat portions to the said posts and braces, substantially as described.

5. In a car-frame, a post constructed of pressed steel, U shape in cross-section midway between ends and having flat ends, similarly-constructed diagonal braces, and channel-girds having flat portions to fit the posts and braces, the said posts, braces and girds adapted to receive wooden nailing-strips.

6. In a car-frame, a vertical post arranged substantially in the plane of the bolster, diagonal braces springing from the foot of the post, and a girth connecting said post and braces, said several parts constructed of hollow or channelled metal with flat intervening portions and flat ends, substantially as described.

7. In a car-frame, vertical side, end and corner posts, diagonal braces between adjacent posts, and girths intersecting and riveted to said posts and braces and having flat portions at the points of intersection and flat ends, combined with the underframe and the roof construction to which the posts and braces are riveted, substantially as described.

8. A hollow metal door-post for cars, having one leg or flange projecting inwardly toward the center of the car, substantially as described.

9. A hollow metal door-post, for cars, of channel form, having one leg or flange projecting inwardly toward the center of the car, the other leg laterally flanged and its ends flattened.

10. A carline of pressed steel, provided with pockets in its upper solid face for the reception of the parline.

11. A hollow pressed-steel carline, provided with a foot-flange 30, end flanges 31, and pockets 32 in its solid face for the reception of the parline.

12. A pressed-steel post, for car-frames, of channel form, provided with lateral flanges extending continuously between its ends, and flat end portions.

13. A pressed-steel brace, for car-frames, of channel form, provided with lateral flanges extending continuously between its ends and flat end portions.

14. A pressed-steel girth, for car-frames, of channel form and having flat portions at its ends and at intervals throughout its length, and adapted to be riveted to the posts and braces of the frame, substantially as described.

701,731. CALCULATING-MACHINE. GEORGE F. HARRISON, Knoxville, Tenn. Filed July 26, 1901. Serial No. 70,374. (No model.)

Claim.—1. In a calculator or analogous machine, a series of numeral-wheels, means for collectively rotating said wheels in one direction and then in a reverse direction and means requiring all of the wheels to always move the same distance in one direction, and means for holding any wheel at rest while the others are rotating in the other direction.

2. In a calculator or analogous machine, two or more numeral-wheels, means for rotating said wheels together in one direction and then in a reverse direction and means requiring both wheels to always move the same distance in one direction, and means for holding either of said wheels at rest while the other is rotating in the other direction.

3. In a calculator or analogous machine, a series of numeral-wheels adapted to be collectively but not separately or singly rotated in one direction and any one or more of which may be held at rest while the others are rotated in the opposite direction, means for rotating the wheels in opposite directions, and means requiring all of the wheels to always move the same distance in one direction, and means for holding any wheel at rest while the others are rotated in the other direction.

4. In a calculator or analogous machine, two or more numeral-wheels, means for rotating said wheels together in one direction and then in a reverse direction, means for holding the wheel representing the lower order at rest while the other wheel is rotating in one of said directions, and automatically-operating means for carrying tens from one wheel to the other.

5. In a calculator or analogous machine, a series of numeral-wheels, means for collectively rotating said wheels in one direction and then in a reverse direction, means for holding any wheel at rest while the others are rotating in one of said directions, and automatically-operating means for carrying tens from each wheel to that representing the next higher order.

6. In a calculator or analogous machine, a series of numeral-wheels, a rotatable shaft on which said wheels are loosely mounted, connections between each wheel and the shaft requiring all of the wheels to move with the shaft when the latter is rotated in one direction but permitting any wheel to be held at rest while the shaft and other wheels are rotated in the reverse direction, means under control of the operator for rotating the shaft a desired distance in opposite directions and for holding any wheel at rest while the other or others are rotated in one of said directions.

7. In a calculator or analogous machine, a series of numeral-wheels, a rotatable shaft on which the wheels are loosely mounted, pawl-and-ratchet connections between each wheel and the shaft requiring all of the wheels to move with the shaft when the latter is rotated in one direction but permitting any wheel to be held at rest while the shaft and other wheels are rotated in the reverse direction, means under control of the operator for rotating the shaft a desired distance in opposite directions and for holding any wheel at rest while the other or others are rotated with the shaft in one of said directions.

8. In a calculator or analogous machine, two numeral-wheels, means under control of the operator for rotating said wheels together in one direction and for holding one wheel while the other is rotated in the opposite direction, pins on one wheel, a pawl on the other, and automatically-operating means for throwing the pawl into engagement with said pins to carry tens from one wheel to the other.

9. In a calculator or analogous machine, a series of numeral-wheels, a shaft upon which said wheels are loosely mounted, pawl-and-ratchet connections between each wheel and the shaft, means under control of the operator for rotating the shaft in opposite directions and for holding any wheel at rest during the rotation of the shaft in one direction, a series of pins projecting from each wheel, a pawl on each wheel adapted to engage the pin of an adjacent wheel, and automatically-operating means for throwing the pawls into engagement with the pins for carrying tens.

10. In a calculator or analogous machine, a series of numeral-wheels, a shaft upon which said wheels are loosely mounted, pawl-and-ratchet connections between each wheel and the shaft, means under control of the operator for rotating the shaft in opposite directions and for holding any wheel at rest during the rotation of the shaft in one direction, a series of pins projecting from each wheel, a pawl on each wheel adapted to engage the pin of an adjacent wheel and having a part projecting beyond the periphery of its wheel, a rod rigidly secured to the shaft and extending across the peripheries of the wheels and adapted by engagement with the projecting parts of the pawls to move the latter into engagement with the pins and automatically carry tens from each wheel to that of the next higher order.

11. In a calculator or analogous machine, a series of numeral-wheels, a rotatable shaft upon which said wheels are loosely mounted, means for locking each wheel to the shaft as the latter rotates in one direction but permitting it to be held at rest while the shaft rotates in the other direction, means under control of the operator for rotating the shaft in opposite directions and for holding any wheel at rest while the shaft and other wheels rotate in said other direction, and means for resetting all of the wheels to a predetermined position.

12. In a calculator or analogous machine, a series of numeral-wheels, a rotatable shaft upon which said wheels are loosely mounted, means for locking each wheel to the shaft in the forward rotation of the latter but permitting it to be held at rest during the backward rotation of the shaft, means under control of the operator for rotating the shaft in opposite directions and for holding any wheel at rest during the backward rotation, and means under control of the operator for arresting all of the wheels in this position on said backward rotation, whereby they are all reset at once or other desired position.

13. In a calculator or analogous machine, a series of numeral-wheels, a shaft upon which they are loosely mounted, means locking each wheel to the shaft as the latter rotates in one direction but permitting it to be held at rest while the shaft rotates in the other direction, means under control of the operator for rotating the shaft in opposite directions any desired distance corresponding to the number to be registered on any wheel and for holding any wheel upon which registry is to be made at rest while the shaft and other wheels are rotated in said other direction.

14. In a calculator or analogous machine, a series of numeral-wheels, a shaft upon which they are loosely mounted, means locking each wheel to the shaft as the latter rotates in one direction but permitting it to be held at rest while the shaft rotates in the other direction, a series of levers for each wheel the several levers of each series being movable different distances corresponding to the number to be registered thereby on the

numeral-wheel of its series, means actuated by the movement of any key for imparting a corresponding backward-and-forward rotation to the shaft, and means actuated by the movement of any key of a series to hold the numeral-wheel of that series at rest while the shaft rotates in said other direction.

701,722. WEIGHING-MACHINE. CHARLES J. HARTLEY and ARTHUR J. HARTLEY, DENTON, DE. Filed Nov. 20, 1901. Serial No. 84,154. (No model.)

Claim.—1. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-actuating bars swung on the concentric pivot and extended above the same and means for moving the extensions of the bars to and from each other to close and open the doors.

2. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-actuating bars swung on the concentric pivot and extended above the same, a pair of toggle-links pivotally connected and pivotally connected with the extensions of the bars, and means for moving the connecting pivot of the toggle-joint up and down to close and open the doors.

3. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-actuating bars swung on the concentric pivot and extended above the same, a vertically-movable slide above the pivot, a pair of toggle-links connected pivotally on the slide and pivotally connected with the extensions of the bars, and means for raising and lowering the slide to close and open the doors.

4. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-actuating bars swung on the concentric pivot and extended above the same, a pair of toggle-links pivotally connected with the extensions of the bars, means for moving the connecting pivot of the toggle-joint up and down to close and open the doors, and a pair of spring-actuated arms pivoted on the receptacle and exerting pressure against the toggle-links.

5. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-actuating bars swung on the concentric pivot and extended above the same, a pair of toggle-links pivotally connecting with the extensions of the bars, means for moving the connecting pivot of the toggle-joint up and down to close and open the doors, and a pair of spring-actuated arms pivoted on the receptacle approximately in line with the conjunction of the toggle-links with the extensions of the bars, when the doors are closed, and extended toward each other into contact with the toggle-links.

6. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-actuating bars swung on the concentric pivot and at-

tended above the same, a pair of toggle-links pivotally conjoined and pivotally connected with the upper ends of the bars, a rotatable disk journaled in relatively fixed bearings above the conjunction of the toggle-links and a pitman-link connecting the crank-pin on the disk with the toggle-joint.

7. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-containing bars swung on the concentric pivot and extended above the same, a pair of toggle-links pivotally conjoined and pivotally connected with the upper ends of the bars, a rotatable disk journaled in relatively fixed bearings above the conjunction of the toggle-links and a pitman-link connecting the crank-pin on the disk with the toggle-joint, one of the connections of the pitman-link being slotted longitudinally to give a limited amount of play.

8. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of arc-formed doors conforming to the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-containing bars swung on the concentric pivot and extended above the same, a pair of toggle-links pivotally conjoined and pivotally connected with the upper ends of the bars, a rotatable disk journaled in relatively fixed bearings above the conjunction of the toggle-links, a pitman-link connecting the disk with the toggle-joint, a drive-wheel journaled adjacent to and concentric with the disk, means for rotating the drive-wheel continuously and means for temporarily connecting the disk with the drive-wheel.

9. In a weighing-machine, the combination of a weighing-receptacle the discharge end of which forms an arc of a circle, a pair of doors for the bottom of the receptacle, a pivot on the receptacle concentric with the circle of which the bottom of the receptacle is an arc, a pair of door-containing bars swung on the concentric pivot, and extended above the same, a pair of toggle-links pivotally conjoined and pivotally connected with the upper ends of the bars, a rotatable disk journaled in relatively fixed bearings above the conjunction of the toggle-links, a pitman-link connecting the disk with the toggle-joint, a drive-wheel journaled adjacent to and concentric with the disk, means for rotating the drive-wheel continuously, a scale-beam sustaining the weighing-receptacle, and means controlled by the rise and fall of the beam for temporarily connecting the disk with the drive-wheel.

10. In a weighing-machine, the combination of a weighing-receptacle sustained by a scale-beam, doors for the bottom of the receptacle, means for opening and closing the doors and means for applying exterior door-opening force to the door-opening mechanism at a point approximately in line with the points of suspension of the receptacle.

11. In a weighing-machine, the combination of a weighing-receptacle sustained by a scale-beam, doors for the bottom of the receptacle, means for opening and closing the doors, a rotatable disk journaled in relatively fixed bearings located above the points of suspension of the receptacle, means for intermittently rotating the disk and a pitman-link connecting with a crank-pin on the disk and with the door-closing mechanism at a point approximately in line with the points of suspension of the receptacle.

12. In a weighing-machine, the combination of a weighing-receptacle, a scale-beam sustaining the receptacle, a stop projection on the receptacle-containing end of the scale-beam, doors for the bottom of the receptacle, a drive-wheel journaled on relatively fixed bearings above the stop projection on the scale-beam, a disk journaled concentric with and adjacent to the drive-wheel, a pawl on the disk adapted to engage projections on the drive-wheel, a spring tending to force the pawl into engagement with the drive-wheel, an arm bearing against the pawl and extending far enough to engage the stop projection when the weighing-receptacle is raised, and a connection between the disk and the beam of the receptacle whereby the doors are opened and closed by a rotation of the disk.

13. In a weighing-machine, the combination of a weighing-receptacle, a chute to deliver material to the weighing-receptacle, a cut-off for the chute, doors for the bottom of the weighing-receptacle, a scale-beam to sustain the receptacle, a stop projection on the receptacle-containing end of the scale-beam, a disk fixed on the shaft journaled above the stop projection on the scale-beam, a drive-wheel journaled loosely on the shaft adjacent to the disk, a cam fixed on the shaft, a cut-off sustaining-bar pivoted near the shaft, an extension of the bar extending into the path of rotation of the cam when the cut-off is closed, a pawl on the disk tending to engage the drive-wheel, an arm pivoted on the shaft contiguous with the pawl and extended to engage the stop projection on the scale-beam when the receptacle is raised and a connection between the disk and the doors of the receptacle.

14. Mechanism for actuating the cut-off of supply-chutes for weigh-

ing-machines, comprising a cut-off sustaining-bar pivotally supported, an extension on the bar, a rotatable shaft, a cam on the shaft to engage the extension and open the cut-off against gravity and a stop to arrest the rotation of the shaft as the cam rides past the extension and the weight of the cut-off begins to exert pressure tending to rotate the shaft forward.

701,798. HAT OR HEAD-GEAR. JULIUS REINHARD, New York, N. Y., assignor to Reinhardt & Lichten, New York, N. Y., a Corporation of New York. Filed Dec. 4, 1901. Serial No. 94,967. (No model.)

Claim.—1. In a hat, the combination of a body portion constructed of brim formed of suitable material, and a stiffening for said brim consisting of a core of reed, strands of material cylindrical in cross-section, of less diameter than the core, surrounding and engaging the periphery of the same, said strands engaging each other, and a cover surrounding and engaging the said strands, substantially as shown and described.

2. A hat composed of brim and a stiffening secured thereto consisting of a core of reed, strands of suitable material circumferentially surrounding and engaging the periphery of said core and engaging each other, and a cover surrounding and engaging the said strands.

701,794. LATHE ATTACHMENT. JOHN R. HEWITT, Brooklyn, N. Y. Filed Dec. 6, 1901. Serial No. 94,912. (No model.)

Claim.—1. A lathe attachment, comprising a table, an arbor carrying a circular saw and driven from the lathe-spindle, the saw extending through a slot in the table, a protractor on the table, a gage adjustable on the table and adapted to be set to any desired angle on the said protractor, to bring the gage at the desired angle relative to the plane of rotation of the saw, and a slide movable transversely on the said table and carrying the said gage-bar, as set forth.

2. A lathe attachment, comprising a table having a depending arm for adjustment in the neck of the tool-post and movable transversely on the machine, an arbor carrying a circular saw and driven from the lathe-spindle, the saw extending through a slot in the table, a protractor on said table, a gage-bar adjustable on the table and adapted to be set to any angle on the said protractor, to hold the gage-bar at the desired angle relative to the plane of rotation of the saw, and an adjustable stop on said gage-bar, as set forth.

701,795. ELECTRIC SWITCH. GEORGE HOSKINS, Westminster, London, England. Filed Jan. 22, 1902. Serial No. 91,682. (No model.)

Claim.—1. An electric switch comprising an insulating-base having fixed on it two contact-pieces connected respectively to any electric wires, a sliding piece in form of a W-shaped elastic strip to form a bridge con-

meeting the contacts, and a disk having an eccentric recess engaging rollers on the sliding piece to effect its to-and-fro motion, constructed and operating substantially as described.

2. An electric switch comprising an insulating base, two contact-pieces mounted thereon, a sliding W-shaped elastic strip forming a bridge between the contacts, rollers on the strip, and a cam device arranged to reciprocate the sliding piece or strip; substantially as described.

701,796. FILTER. GEORGE F. HUCKMAN, Chicago, Ill. Filed Dec. 20, 1901. Serial No. 87,385. (No model.)

Claim.—1. The combination, with a filter, a filter-bed, and means for supplying water thereto from the source of supply, of an open-bottom trough arranged in close relationship to the upper surface of the filter-bed, and a conductor leading from the open-bottom trough to the place of discharge whereby the film or crust formed on the top of the filter-bed when broken may be removed therefrom, substantially as described.

2. The combination with a filter, a filter-bed, and means for supplying water thereto from the source of supply, of an open-top trough, an open-bottom trough, and a conductor leading from the open-bottom trough slightly above the level of the surface of the filter-bed to the place of waste, whereby the water is supplied to the filter, and the film or crust formed upon the surface of the filter-bed when broken may be floated away, substantially as described.

3. The combination, with a filter, a filter-bed, means for supplying water thereto from the source of supply, an open-bottom trough arranged in close relationship to the upper surface of the filter-bed, and a conductor leading from the open-bottom trough to the place of waste, of a series of rake-teeth arranged above the filter-bed and adapted to trail upon its upper surface, and means for supporting and revolving these teeth around over each upper surface, whereby not only is the water supplied to the filter, but the film or crust formed on the top of the filter-bed broken and carried away to the place of waste, substantially as described.

4. The combination, with a filter, a filter-bed, an open-top trough, an open-bottom trough, conductors for respectively supplying water to the open-top trough and to the under side of the filter-bed, and means for controlling the flow of water through these conductors, of conductors leading from both the open-top trough and the open-bottom trough to the place of waste, means for controlling the flow of water through these conductors, a series of rake-teeth arranged in relation to the filter-bed, a carrier for supporting these rake-teeth, and means for rotating said teeth in one and in the other direction, whereby not only may water be supplied to the filter, the film or crust formed on the top of the filter-bed broken, and the fragments carried away to the place of waste, but the washing of the filter-

bed and the agitation and loosening up of the components thereof effected during the washing operation, substantially as described.

5. The combination, with a filter, and the filter-bed arranged therein, of a rake comprising a shaft and teeth fixedly secured thereto, a carrier in which each shaft is rotatably journaled whereby to permit of the teeth being swung upwardly by the action of the filter-bed upon them and trailed upon the upper surface thereof, when the rake is carried around in one direction, and of being swung downward by its action upon them, when the rake is carried around in the opposite direction, and mechanism for limiting the downward swinging movement of the teeth, and for rotating each carrier in one and in the other direction over the filter-bed, substantially as described.

6. The combination, with a filter provided with a track around its upper edge, and a filter-bed arranged therein, of a carrier extending across the filter-bed and provided with wheels for cooperation with each track, rakes, each of which comprises a shaft and teeth fixedly secured thereto, journaled to each carrier whereby to permit of the teeth being swung upward by the action of the filter-bed upon them and trailed upon its upper surface, when the rakes are carried around over the same in one direction, and of being swung downward by its action upon them, when the rakes are carried around over it in the opposite direction, and mechanism for limiting the downward swinging movement of each tooth and for rotating said carrier in one and in the other direction over the filter-bed, substantially as described.

7. The combination, with a filter, a filter-bed arranged therein, and a carrier H provided with the stands or hangers *s*, of rakes M, each of which comprises a shaft *t* journaled in each stand or hanger and provided with teeth *u* fixedly secured thereto, whereby each tooth is rendered capable of being swung upward by the action of the filter-bed upon them and trailed upon its upper surface, when the rakes are carried around over the same in one direction, and of being swung downward by its action upon them when the rakes are carried around over it in the opposite direction, stops *v* for limiting the downward swinging movement of said teeth, and mechanism for rotating the carrier in one and in the other direction over the filter-bed as required, substantially as described.

701,797. PAPER-HANGING MACHINE. OTTOMENT BAKER, Montgomery, W. Va. Filed Jan. 15, 1902. Serial No. 92,504. (No model.)

Claim.—1. In a machine for hanging wall-paper, the combination of a body, a roller removably mounted therein, and an adjustable brush cooperating with the said roller, the said brush being reversible to extend above or below the plane of the roller.

2. In a paper-hanging machine, the combination of a body, a roller removably mounted therein, a brush, cooperating with the roller, and an arm adjustable on the body and having a handle attached thereto.

3. A paper-hanging machine comprising a segmental body with paper-supporting and cutting means, and an arm having a portion embracing and slidable on the said body in the arc of a circle, the said arm having a handle attached thereto.

4. In a paper-hanging machine, the combination of a body, paper-supporting means carried by said body, and a brush having a series of curved arms adjustable in relation to a portion of the body.

5. A paper-hanging machine comprising a body with paper-supporting means, and a cutting device having curved arms adjustable and reversible in relation to a portion of the body.

6. A paper-hanging machine comprising paper-supporting means, and a cutting device adjustable and reversible in relation to the said supporting means.

701,798. CHAIR. SAMUEL H. BROWN, Athens, Ohio. Filed May 20, 1901. Serial No. 62,391. (No model.)

Claim.—1. The combination of two members, one having an opening formed with an enlargement, the other member having a pin entering said opening, and a metal washer cast on the pin and filling the enlargement of the opening and forming a rotatable journal therein, thereby permanently hinging or pivoting the parts together, substantially as described.

2. The combination of two members, one having an opening enlarged at one end, the other member having a pin engaging said opening, and a non-frictional metal washer fixedly secured on the end of the pin and rotatable therewith and filling the enlargement of the opening, thereby permanently hinging or pivoting the parts together, substantially as described.

3. The combination of a member having an opening provided with an enlargement, a second member having a lug or pin entering said opening and projecting into said opening; and a non-frictional washer or journal filling said enlargement and cast on the lug, said washer rotating with the pin and forming an antifriction-journal permanently pivoting the parts together, substantially as described.

4. The combination of a member having an opening provided with a circular enlargement at one end, a second member having a lug or pin entering said opening and projecting into said enlargement, and a non-frictional washer cast on the lug, said washer being rotatable with the lug and filling said opening and enlargement and permanently pivoting the parts together, substantially as described.

5. The combination of the standard and seat-bracket, an opening in one member having an enlargement; a pin or lug on the other member entering in said opening, and a non-frictional washer filling said enlargement and cast onto and rotatable with the pin for the purpose and substantially as described.

6. The combination of the standard having an opening provided with a circular enlargement at one end, a seat-bracket having a lug or pin entering said opening projecting into said enlargement, an antifrictional metal washer cast onto and rotatable with a pin, and said washer forming the journal of the seat-bracket and permanently seating the parts for the purpose and substantially as described.

7. The combination of the standard having an opening provided with a circular enlargement the brace-bar having a pin entering said opening, and a metal washer cast on this pin and filling the enlargement of the opening, thereby permanently hinging or pivoting the parts together; with a seat-bracket pivoted to the standard and having a pin-and-socket connection to the brace-bar for the purpose and substantially as described.

8. The combination of the standard, and brace-bar an opening in one member having an enlargement, a pin or lug on the other member projecting into said opening, and a non-frictional washer filling said enlargement and fixedly secured to the pin, with a seat-bracket pivoted to the standard and having a pin-and-socket connection to the brace-bar for the purpose and substantially as described.

701,799. HATCH-SAFE. WILLIAM C. HURLEY, Kewanee, Ind. Tex. Filed July 20, 1901. Serial No. 99,147. (No model.)

Claim.—1. An attachment for a miner's cap, comprising a back plate having oppositely-extending perforated ears at its upper part whereby it may be secured to the cap, a roll formed at one edge of the back and providing a cylindrical pick-tube, a spring-strip therein, a spring fitted in said tube and adapted to retain a pick therein, a cylindrical casing secured to the back and having a roughened outer surface, a segmental cover hinged to the casing at the rear thereof, a spring for holding the cover normally open, flanges on the casing adapted to extend under the cover when closed, a lip on the cover, a spring-controlled latch adapted to engage the lip and hold the cover closed, and a releasing-pin on the latch.

2. An attachment for miners' caps comprising a base-plate, a pick-holder formed integral therewith, and a catch-rod secured to said base,

said catch comprising a casing having a roughened surface, circular ends thereto, a cover hinged to the casing, flanges extending from the ends and adapted to seal the ends of the cover when closed, a spring for holding the cover normally open, a spring-controlled latch in the casing, a lip on the cover adapted to be engaged thereby, and a releasing-pin on the latch.

701,780. METALLIC PACKING DEVICE. FRED A. INMAN, Chicago, Ill., assignor of one-half to Eugene H. Gullett, Chicago, Ill. Filed July 10, 1901. Serial No. 67,722. (No model.)

Claim.—In a packing for piston-rods, the combination of a cup-like projection on the cylinder with a series of cups within each cup-like projection; a cap for the cup-like projection having an enlarged portion which fits therein, a ring fitting upon the outer cup, packing-rings one in each cup and formed of segments, an inner similar packing-ring within the first-mentioned packing-ring and also in segments, a coiled spring about the outer ring to hold the parts together and against the rod, the cups formed in segments and having free spaces about the rings so that the steam escaping along the rod is retained in the cup-like projection and tends to help set the packing-rings, and the several cups and packing-rings can be removed from the rod substantially as shown and described.

701,781. MAGAZINE-HAMMER. WILLIAM JAGG, Paldi, Minn., assignor of seventeen-thirtieths to John E. Snyder, Paldi Snyder, and James A. Wilson, residing in or near Paldi, Minn., and Mathias Rodlinger, Prospect, Ill. Filed May 7, 1901. Serial No. 66,678. (No model.)

Claim.—1. In a magazine-hammer, the combination with the driving-head, of a magazine terminating in said head, component mechanism in said head permitting the passage of a single nail to the driving-point, yielding means for holding the nail at the driving-point and permitting its partial driving while held thereby by one blow, and a trigger controlling said component mechanism, and automatically operated when the nail is driven home.

2. In a magazine-hammer, the combination with the driving-head, of a magazine terminating in said head, component mechanism in said head permitting the passage of a single nail to the driving-point, and a trigger controlling the operation of said component mechanism and projecting a very slight distance below the face of the hammer-head.

3. In a device of the class described, the magazine consisting of the channel 26 large enough to receive the heads of the nails, the slot 24 beneath the channel through which the bodies of the nails pass, and the walls 27 having the forwardly-pointing ratchet-teeth projecting inwardly.

4. In a magazine-hammer, the combination of the magazine-channel having its outer end closed by the pivoted component-lever and the guard-piece 25 extending longitudinally of the hammer-head, with the vertically-movable trigger 51 having one end projecting beyond the end of the hammer and its other end cooperating with said lever and guard-

piece to operate the lever as the trigger is raised, and means for holding the escapement-lever normally in non-releasing position; substantially as described.

5. In a device of the class described, the combination of the magazine-channel having its outer end closed by the escapement-lever 34 having the inclined slot 30 therein, with the trigger having the end 53 projecting through the slot 30 in a guard-piece 35 into the slot 30 so as to swing the escapement-lever as the trigger is raised; substantially as described.

6. In a device of the class described, the combination of the magazine-channel having its outer end closed by the escapement-lever having the inclined slot 30 therein, and the guard-piece 35 having the vertical slot 36 therein, with the vertically-movable trigger 51 having one end projecting beyond the head of the hammer and its other end 52 projecting beyond the slot 36 into the slot 30 so that the escapement-lever will be swung thereby as the trigger is raised; substantially as described.

7. In a magazine-hammer, the combination of the magazine-channel having its outer end closed by the escapement-lever 34 and the guard-piece 35 extending longitudinally of the head, with the vertically-movable trigger 51 having one end projecting beyond the end of the hammer and the other end 52 cooperating with said lever to release the nail, and the spring holding said escapement-lever normally in its non-releasing position.

8. In a device of the class described, the combination of the magazine-channel having its outer end closed by the escapement-lever 34 having the inclined slot 30 therein, and the guard-piece 35 having the vertical slot 36 therein, with the vertically-movable trigger 51 having one end projecting beyond the head of the hammer and its other end 52 projecting at right angles from the body of the trigger through the slot 36 and into the slot 30, and the spring cooperating with said trigger to hold it normally in its non-releasing position.

9. In a device of the class described, the combination with the magazine-channel, of the swinging escapement-lever 34 closing the end thereof and having the T-shaped recess 40 therein, the stationary guard-piece having the recess 37 therein and the finger 38, and means for swinging said lever when it is desired to release a nail.

10. In a device of the class described, the combination of the magazine-channel having its outer end closed by the escapement-lever 34 and the guard-piece 35, with the vertically-movable trigger 51 having one end 52 projecting horizontally from the vertical body thereof and adapted to move said escapement-lever to release a nail, and the helically-coiled expanding-spring secured above the arm 50 and serving to hold it yieldingly in its inoperative position.

11. In a device of the class described, the combination with the head having the channel 56 therein and the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel 56, of the swinging piece 42 having its lower end above the shoulder 63, and means for yieldingly holding it in its normal position.

12. In a device of the class described, the combination with the head having the channel 56 therein and the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel 56, of the swinging piece 42 having its lower end above the shoulder 63, and means for yieldingly holding it in its normal position, consisting of the spring 57 cooperating with it below its pivotal point.

13. In a device of the class described, the combination with the head having the channel 56 therein and the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel 56, of the swinging piece 42 having the recess 50 in the lower end of said piece just above the shoulder 63, and means for holding said swinging piece yieldingly in its normal position.

14. In a device of the class described, the combination of the hammer-head having the magazine-channel extending into it, the outer end of which is closed by the escapement-lever 34 and the guard-piece 35, the channel 56 extending through the head and having the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel 56, with the swinging piece 42 having its lower end above the shoulder 63, means for holding it yieldingly in position, and the vertically-movable trigger carried by said swinging piece and having one end projecting beyond the head of the hammer and its other end adapted to move said escapement-lever to release a nail; substantially as described.

15. In a device of the class described, the combination of the head having the channel 56 extending therethrough and provided at one portion with the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel, the magazine-channel opening into the channel 56 at its upper end and having its outer end closed by the escapement-lever 34 and the guard-piece 35, the swinging piece 42 having its lower end above the shoulder 63 and provided on its outer face with the channel 48 and the staple 55, the spring 57 and the trigger 51 having the body portion thereof extending along the channel 48 and

through the staple 55 and the end 52 thereof serving to operate the escapement-lever to release the nail; all combined and cooperating substantially as and for the purpose described.

16. In a device of the class described, the combination with the head having the channel 56 therein and the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel 56, of the swinging piece 42 having its lower end above the shoulder 63, means for holding it yieldingly in position, escapement mechanism for releasing the nail, and the spring-pressed trigger mounted to slide in said swinging piece; substantially as described.

17. In a device of the class described, the combination with the head having the channel 56 therein and the shoulder 63 on which the head of the nail is adapted to rest as its body extends through the channel 56, of the swinging piece 42 having its lower end above the shoulder 63 and having the channel 48 therein, the recess 49 terminating the channel 48 at its upper end, the staple 55, means for holding said piece yieldingly in its inoperative position, escapement mechanism for the nail, and the L-shaped spring-pressed trigger 51 having the body portion extending longitudinally of the channel 48 and its end projecting beyond the head of the hammer and its horizontal portion 52 projecting through the slot 40 and serving to operate the escapement mechanism; substantially as described.

18. In a device of the class described, the combination with the head having the channel 56 therein, the shoulder 63 for the purpose described, a recess above said channel; of the escapement mechanism in the upper end of said channel; and the yielding swinging piece having its lower end above the shoulder 63; said recess being so shaped as to cause a nail released from the escapement mechanism to slide down into position with its head on the shoulder 63.

19. In a device of the class described, the combination with the head having the channel 56 therein, the shoulder 63, a recess above said channel, the inclined surface 62 connecting said recess and said channel, of the escapement mechanism in the upper end of said channel adapted to discharge a nail point first on the inclined surface 62 and the yielding swinging piece having its lower end above the shoulder 63, said channel 56 extending downwardly from beneath the escapement mechanism, said channel and recess being so shaped as to cause a nail released from the escapement mechanism to slide down into position with its head on the shoulder 63; substantially as described.

701,789. THREAD-CUTTING MACHINE. CHARLES W. JONES, Philadelphia, Pa., assignor to the Russell, Barndall & Ward Belt and Nut Company, Fort Chester, N. Y., a Corporation of New York. Filed Apr. 12, 1901. Serial No. 55,617. (No model.)

Claim.—1. In a thread-cutting machine, the combination of a suitable holder for articles to be threaded, a slidable carrier adapted to successively receive said articles from the holder, and a combined threading and feeding device adapted to thread the article in said carrier and reciprocate the latter toward and from a position to receive articles from the holder.

2. In a thread-cutting machine, the combination of a suitable holder for a series of articles to be threaded, a slidable carrier adapted to successively receive said articles from the holder, two combined threading and feeding devices arranged to alternately engage and thread articles in and reciprocate said carrier, and means for actuating said devices, the parts being so arranged that each threading device is maintained in engagement with the article last threaded until the other threading device has engaged the next article to be threaded, whereby each threading device acts as a guide for the other with relation to the article to be threaded by it.

3. In a thread-cutting machine, the combination of a suitable holder for articles to be threaded, a slidable carrier adapted to successively receive said articles from the holder, and two combined threading and feeding devices arranged on opposite sides of said carrier and operating to

alternately thread articles therein and each reciprocating said carrier toward the other said device while being withdrawn from engagement with the article threaded by it.

4. In a thread-cutting machine, the combination with means for supplying articles to be threaded, of an apertured stand or support, two reciprocating, open at the top and bottom, slightly mounted on said stand and adapted to alternately receive the articles to be threaded, and a combined threading and feeding device arranged to thread articles in said receptacles and reciprocate the latter alternately into position to receive from the holder an article to be threaded and to discharge a threaded article through an aperture in the stand or support.

5. In a thread-cutting machine, the combination of a support or stand, a holder for articles to be threaded arranged above said stand, a carrier mounted on the stand and having two passages formed therein, and two combined threading and feeding devices arranged on opposite sides of said carrier to alternately thread articles therein and to reciprocate said carrier to bring the passages therein alternately into position to receive from the holder an article to be threaded and into alignment with an aperture in the stand or support to discharge a threaded article.

701,788. COMBINED BAKING-STOVE AND STEAM-COOKER. WILL A. JAMES, Port Worth, Tex. Filed July 14, 1901. Serial No. 63,548. (No model.)

Claim.—1. The combination of a lower casing having an inner shell forming an oven, upright pipes extending through the top of the casing, an upper casing mounted upon the lower casing and forming a steamer, an exterior pipe or tube connected with the said pipes, a receptacle having a nipple or spout fitting in the exterior pipe or tube, and means for controlling the flow of water into the said pipes, substantially as described.

2. The combination of a lower casing upon at the bottom and provided at its top with openings, an inner shell forming an oven, upright pipes arranged in the space between the inner shell and the lower casing and extending through the openings of the top of the latter, bottom pipes connecting the upright pipes, an exterior pipe or tube extending into the casing and connected with the said pipes, an upper steam-cooker consisting of a casing upon at the bottom and mounted upon the said casing, an exterior receptacle designed to contain water and supported by the lower casing and having a nipple or spout fitting in the exterior tube or pipe, and means for controlling the flow of water from the receptacle, substantially as described.

701,784. PAPER OF VARIABLE THICKNESS. CHARLES C. JAMES, Raleigh, N.C. Original application filed Mar. 5, 1901, Serial No. 48,678. Divided and this application filed June 26, 1901. Serial No. 65,586. (No specimens.)

Claim.—1. The method of manufacturing paper of variable thickness designed to be used where it is desired to attach independent sheets or leaves thereof to a book or to each other, so as to obtain a substantially uniform thickness or flush surfaces when the sheets or leaves are so united, consisting in: channeling the paper material before the same has been subjected to motion.

2. The method of manufacturing paper of variable thickness designed to be used where it is desired to attach independent sheets or leaves thereof to a book or to each other, so as to obtain a substantially uniform thickness or flush surfaces when the sheets or leaves are so united, consisting in: channeling the paper material before the same is subjected to motion, and then extracting a greater proportion of moisture from the thinner portion than from the thicker portion.

3. The method of manufacturing paper of variable thickness designed to be used where it is desired to attach independent sheets or leaves thereof to a book or to each other, so as to obtain a substantially uniform thickness or flush surfaces when the sheets or leaves are so united, consisting in: channeling the paper during the ordinary process of manufacture and before it is subjected to motion, and in extracting moisture from the channelled portion or portions.

701,785. SPIKE-TOOTH HARROW. THOMAS B. JAMES, Syracuse, N. Y. Original application filed Aug. 13, 1901, Serial No. 71,703. Divided and this application filed Jan. 6, 1902. Serial No. 66,895. (No model.)

Claim.—1. In a spike-tooth harrow, the combination of a frame-bar having a substantially flat normally lower face, a substantially flat and upright side face formed with a longitudinal channel, and an opposite side face provided with a lower surface extending upwardly at an angle from the contiguous part of said lower face; with a spike-tooth having its upper portion provided with an attaching and passed through the frame-bar, said upper portion being also provided with an integral shoulder having a substantially flat intermediate part and upwardly-extending forward and rearward parts respectively engaged with and substantially closely fitting said lower and opposite side faces of the frame-bar, substantially as and for the purpose described.

2. In a spike-tooth harrow, the combination of a frame-bar having a substantially flat normally lower face, a substantially flat and upright side face formed with a longitudinal channel, and an opposite side face provided with a lower surface curving upwardly from the contiguous part of said lower face; with a spike-tooth having its upper portion provided with an attaching and passed through the frame-bar, said upper portion being also provided with an integral shoulder extending laterally, forwardly and rearwardly beyond the underlying portion of the spike-tooth, the intermediate part of the shoulder being engaged with and substantially closely fitting the lower face of the frame-bar and the forward and rearward parts of the shoulder being of unequal height, the shorter one of said forward and rearward parts being substantially upright and engaged with the substantially flat and upright side face of the frame-bar, and the longer one of said forward and rearward parts being curved upwardly and engaged with said curving surface of the opposite side face of the frame-bar, substantially as and for the purpose specified.

701,786. GOLF-BALL. BLAINE KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Apr. 22, 1902. Serial No. 104,102. (No model.)

Claim.—1. A playing-ball comprising windings of tensioned rubber incased by a shell formed of plastic material; a perforation extending entirely through said ball, and the rubber being cut or covered in the region of said perforation and tending to expand the shell.

2. A playing-ball comprising windings of tensioned rubber incased by a shell formed of plastic material; perforations extending entirely through said ball, and the rubber being cut or covered in the region of said perforations and tending to expand the shell; said perforations being diametrical and intersecting at the center of the ball.

3. A playing-ball comprising windings of tensioned rubber incased by a shell formed of plastic material; three perforations extending each entirely through said ball, each at right angles to the others; the rubber being cut or covered in the region of said perforations and tending to expand the shell in all directions, and said perforations being diametrical and intersecting at the center of the ball.

4. A playing-ball comprising a filling which consists of windings of tensioned rubber, and a whole spherical shell of hard material including said filling; at least a portion of said windings of rubber being covered, and tending to expand said shell.

5. A playing-ball comprising windings of tensioned rubber incased by a shell formed of plastic material and provided with a perforation; the rubber being cut or covered in the region of said perforation and tending to expand the shell; and an outer tubular shell secured upon said shell and covering said perforation.

6. A playing-ball comprising windings of tensioned rubber incased by a shell formed of plastic material, the structure being provided with diametrical perforations, which intersect at the center of the ball, and the rubber being cut or covered in the region of said perforations and tending to expand the shell in all directions; and an outer shell of plastic material welded upon said shell.

7. A playing-ball comprising windings of tensioned rubber incased by a shell formed of plastic material, the structure being provided with three diametrical perforations, which intersect at the center of the ball and extend at right angles to one another; the rubber being cut or covered

oved in the region of said perforations and tending to expand the shell in all directions; and an outer shell of similar plastic material welded upon said shell.

8. A playing-ball comprising a center piece, windings of tensioned rubber thereon, and a shell formed of gutta-percha upon said rubber; perforations extending entirely through said ball, and the rubber being cut or covered in the region of said perforations and tending to expand the shell.

9. A playing-ball comprising windings of tensioned rubber incased by a shell formed of gutta-percha, the structure being provided with perforations, and the rubber being cut or covered in the region of said perforations and tending to expand the shell; and an outer shell of gutta-percha compressed upon said shell and covering the perforations.

701,787. GOLF-BALL. BLAINE KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Apr. 22, 1902. Serial No. 104,316. (No model.)

Claim.—1. A playing-ball comprising a highly-compressed substantial fabric-lined gutta-percha shell expanded by plastic material injected thereto and forming a core, the shell constantly tending to compress the core and the latter to expand the shell.

2. A playing-ball comprising a highly-compressed substantial fabric-lined gutta-percha shell distended by gutta-percha injected thereto.

3. A playing-ball comprising a gutta-percha shell consisting of fabric-lined segments, and distended by gutta-percha injected thereto.

4. A playing-ball consisting of a highly-compressed shell built up from compressed gutta-percha fabric-lined segments, said segments being connected edge to edge, and said shell being expanded by gutta-percha forced thereto.

5. A playing-ball comprising a shell built up of highly solidified or compressed thick hemispherical sections of well-cured gutta-percha and lined with fabric, said shell being expanded by plastic material injected thereto.

6. A playing-ball comprising a highly-compressed fabric-lined gutta-percha shell distended by gutta-percha injected thereto and forming a core; the diameter of said core being about one-half that of the complete ball.

7. A playing-ball comprising a shell formed at least partially from plastic material lined with fabric, and distended by similar plastic material injected thereto.

8. A playing-ball comprising a highly-compressed substantial fabric-lined gutta-percha shell, and a sphere of gutta-percha held under permanent compression by said shell.

701,788. GOLF-BALL. BLAINE KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Apr. 22, 1902. Serial No. 104,316. (No model.)

Claim.—1. A playing-ball comprising a sphere of soft rubber, a shell of celluloid thereon, and a shell of gutta-percha upon said celluloid.

2. A playing-ball comprising a sphere of soft rubber, a shell of celluloid thereon, and a shell of gutta-percha upon said celluloid; said celluloid and gutta-percha shells holding said soft rubber under compression.

3. A playing-ball comprising a center piece of gutta-percha, a layer of soft rubber thereon, a shell of celluloid upon said soft rubber, and a shell of gutta-percha upon said celluloid.

4. A playing-ball comprising a sphere of soft rubber, a shell of fabric-lined celluloid thereon, and a shell of gutta-percha upon said celluloid.

5. A playing-ball comprising a sphere of soft rubber, a shell of fabric-lined celluloid thereon, and a shell of gutta-percha upon said celluloid, said celluloid and gutta-percha shells holding said soft rubber under compression.

6. A playing-ball comprising a center piece of gutta-percha, a layer of soft rubber thereon, a fabric-lined shell of celluloid upon said soft rubber, and a shell of gutta-percha upon said celluloid.

7. A playing-ball comprising a sphere of soft rubber, a fabric-lined shell of celluloid thereon, and a fabric-lined shell of gutta-percha upon said celluloid.

8. A playing-ball comprising a sphere of soft rubber; a shell of celluloid thereon, and a fabric-lined shell of gutta-percha upon said celluloid; said celluloid and gutta-percha shells holding said soft rubber under compression.

9. A playing-ball comprising a center piece of gutta-percha; a layer of soft rubber thereon, a shell or layer of fabric-lined celluloid upon said soft rubber, and a shell of fabric-lined gutta-percha upon said celluloid.

10. A playing-ball comprising a sphere of soft, yielding material, a shell thereon composed of celluloid and fibrous material, and an outer shell of gutta-percha.

701,789. GOLF-BALL. BLAINE KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Apr. 22, 1902. Serial No. 104,317. (No model.)

Claim.—1. A playing-ball comprising a rubber sphere, a layer of gutta-percha thereon, a layer of fabric-lined gutta-percha upon said first layer, and a casing of fabric-lined celluloid upon said second gutta-percha layer.

2. A playing-ball comprising a rubber sphere, a layer of gutta-percha thereon, a layer of fabric-lined gutta-percha upon said first layer, and a casing of fabric-lined celluloid upon said second gutta-percha layer; said gutta-percha and celluloid layers holding said celluloid sphere under compression.

3. A playing-ball comprising a hard center piece, a rubber sphere thereon, a fabric-lined gutta-percha layer upon said sphere, a second fabric-lined gutta-percha layer upon said first layer, and a fabric-lined celluloid layer upon said second layer.

4. A playing-ball comprising a hard center piece, a rubber sphere thereon, a fabric-lined gutta-percha layer upon said sphere, a second fabric-lined gutta-percha layer upon said first layer, and a fabric-lined celluloid layer upon said second layer; each of said gutta-percha layers consisting of welded hemispherical segments.

5. A playing-ball comprising a hard center piece, a rubber sphere thereon, a fabric-lined gutta-percha layer upon said sphere, a second fabric-lined gutta-percha layer upon said first layer, and a fabric-lined celluloid layer upon said second layer; each of said gutta-percha layers consisting of welded hemispherical segments, the welds of said segments crossing each other, so that the body of one layer reinforces the weld of the other; and said celluloid casing consisting of telescoped hemispherical cups welded upon said second gutta-percha layer.

6. A playing-ball comprising a hard center piece, a rubber sphere thereon, a fabric-lined gutta-percha layer upon said sphere, a second fabric-lined gutta-percha layer upon said first layer, and a fabric-lined celluloid layer upon said second layer; each of said gutta-percha layers consisting of welded hemispherical segments, the welds of said segments crossing each other, so that the body of one layer reinforces the weld of the other; and said celluloid casing consisting of telescoped hemispherical cups welded upon said second gutta-percha layer; the joint or weld of said casing running crosswise of the weld in said second gutta-percha layer.

7. A playing-ball comprising a hard center piece, a rubber sphere thereon, a fabric-lined gutta-percha layer upon said sphere, a second fabric-lined gutta-percha layer upon said first layer, and a fabric-lined celluloid layer upon said second layer; each of said gutta-percha layers consisting of welded hemispherical segments, the welds of said segments crossing each other, so that the body of one layer reinforces the weld of the other; and said celluloid casing consisting of telescoped hemispherical cups welded upon said second gutta-percha layer; the joint or weld of said casing running crosswise of the weld in said second gutta-percha layer.

701,740. GOLF-BALL. BLAINE KENNEDY, Boston, Mass., assignor to The Kennel Manufacturing Company, a Corporation of New Jersey. Filed Apr. 22, 1902. Serial No. 104,157. (No model.)

Claim.—1. A playing-ball comprising a hard shell, a center piece, and an intermediate elastic soft-rubber shell partially collapsed and compressed between said shell and said center piece.

2. A playing-ball comprising a hard, wear-resisting cover, a distorted shell of soft rubber held under compression thereby, said shell being distorted throughout in radial direction, and a center piece within said shell.

3. A playing-ball comprising a shell of plastic material, an oversize soft-rubber seamless shell partially collapsed and confined under compression within said plastic shell, and an undersize springy center piece filling said collapsed rubber shell.

4. A playing-ball comprising a shell consisting of welded segments of gutta-percha; an oversize soft-rubber shell confined under compression within said gutta-percha shell; and a center piece of hard material within said soft-rubber shell.

5. A playing-ball comprising a center piece of plastic material; a rubber shell thereon; and a cover of hard, wear-resisting material upon said shell; the latter being in a state of partial collapse and held under compression by said cover.

6. A playing-ball comprising a shell formed of welded segments of plastic material; an oversize soft-rubber shell partially collapsed and confined under compression within said gutta-percha shell; and an undersize center piece filling said collapsed shell.

7. A playing-ball comprising a spherical center piece of gutta-percha; a seamless rubber shell thereon; and a cover of gutta-percha upon said shell; the latter being in a state of partial collapse and being held under compression by said cover.

701,741. GOLF-BALL. BRADEN KEMPSTALL, Boston, Mass., assignor to The Kempshall Manufacturing Company, a Corporation of New Jersey. Filed May 5, 1902. Serial No. 106,867. (No model.)

Claim.—1. A playing-ball comprising a shell having two layers of plastic material; the inner layer being harder than and distinct from the outer layer, said outer layer forming the cover of the ball.

2. A playing-ball comprising a yielding filling and a shell consisting wholly of two layers; the inner layer consisting of celluloid and the outer layer consisting of a more yielding plastic material.

3. A playing-ball comprising a shell consisting wholly of two layers, the outer layer consisting of plastic material and being materially thicker and more yielding than the inner layer, said outer layer forming the cover of the ball.

4. A playing-ball comprising a rubber sphere and a shell, the latter consisting wholly of two springy layers, and the outer layer being materially thicker than the inner layer and also consisting of more yielding material.

5. A playing-ball comprising a shell having an inner layer of celluloid and an outer layer of gutta-percha, and a yielding filling.

6. A playing-ball comprising a shell having two layers of plastic material, the inner layer being harder and distinct from the outer layer, and a yielding filling held under compression by said shell.

7. A playing-ball comprising a shell having an inner hard layer, an outer layer of gutta-percha, said outer layer being materially thicker than said inner layer; and a rubber sphere held under compression by said shell.

8. A playing-ball comprising a shell having an inner layer of celluloid and an outer layer of gutta-percha, said outer layer being materially thicker than said inner layer; and a springy filling held under compression by said shell.

9. A playing-ball comprising a shell consisting of an outer layer of molded springy material, and an inner supporting layer of harder springy material; said layers being interlocked.

10. A playing-ball comprising a shell consisting wholly of two layers, the inner layer being perforated, and the material of the outer layer penetrating the perforations; said inner layer being materially thinner than said outer layer.

11. A playing-ball comprising a shell consisting of two layers of plastic material; the inner layer being perforated and the material of the outer layer penetrating the perforations, said outer layer being materially thicker and of more yielding material than said inner layer.

12. A playing-ball comprising a shell and a yielding filling; said

shell consisting of two layers, one layer being perforated and the material of the other layer penetrating the perforations; and the outer layer being materially thicker than the inner layer and also of softer material.

13. A playing-ball comprising a shell having interlocked layers, the inner layer being of harder material than the outer layer, and a yielding filling held under compression by said shell.

14. A playing-ball comprising a shell consisting of a perforated inner layer of celluloid, an outer layer of gutta-percha, the material of said outer layer penetrating said perforations; and a yielding filling held under compression by said shell.

15. A playing-ball comprising a shell consisting of an inner layer of celluloid and an outer layer of gutta-percha; said layers being interlocked; and a yielding filling held under compression by said shell.

16. A playing-ball comprising a shell consisting wholly of two layers, the inner layer being perforated and the material of the outer layer penetrating the perforations; said outer layer being materially thicker than said inner layer and also of softer material; and a yielding filling held under compression by said shell.

17. A playing-ball comprising a shell having two layers of plastic material; the inner layer being perforated and also being harder than and distinct from the outer layer, and the latter consisting of welded segments; and a springy core.

18. A playing-ball comprising a yielding filling and a shell consisting wholly of two layers; the inner layer consisting of separated segments and the outer layer consisting of welded segments of plastic material; the weld portion of the outer layer protruding between the edges of said separated segments.

19. A playing-ball comprising a shell consisting wholly of two layers, the inner layer consisting of celluloid and the outer layer consisting of welded segments of gutta-percha and being materially thicker than the inner layer; and a yielding filling held under compression by said shell.

20. A playing-ball comprising a shell having an inner layer consisting of segments of celluloid and an outer layer consisting of welded segments of gutta-percha, and a yielding filling within said shell and forming the body of the ball.

21. A playing-ball comprising a shell having two layers of plastic material, the inner layer being harder and distinct from the outer layer and also being perforated, and a yielding filling held under compression by said shell.

22. A playing-ball comprising a shell having an inner hard layer, an outer layer consisting of welded segments of gutta-percha, said outer layer being materially thicker than said inner layer; and a rubber sphere held under compression by said shell.

23. A playing-ball comprising a shell having an inner perforated layer of celluloid and an outer layer of gutta-percha, said outer layer being materially thicker than said inner layer; and a springy filling held under compression by said shell.

24. A playing-ball comprising a shell having an outer layer consisting of welded segments of gutta-percha, and an inner thinner layer of harder springy material; said layers being interlocked, said outer layer forming the cover of the ball.

25. A playing-ball comprising a shell consisting wholly of two layers, the inner layer consisting of separated segments each of which is perforated, and the material of the outer layer penetrating the perforations; said outer layer consisting of welded segments, the welded portion of the outer layer extending between said separated segments, said outer layer forming the cover of the ball.

26. A playing-ball comprising a shell consisting of two layers, the inner layer being perforated and consisting of separated segments of celluloid, and the material of the outer layer penetrating the perforations, said outer layer consisting of welded segments of gutta-percha and being materially thicker than said inner layer; the welded portion of the gutta-percha layer extending between the celluloid segments, said outer layer forming the cover of the ball.

27. A playing-ball comprising a shell consisting of two layers, one layer being provided with perforations each whereof extends through said layer, the perforations being counterbored, and the material of the other layer penetrating the perforations.

28. A playing-ball comprising a shell having interlocked layers, the inner layer being of celluloid and perforated, and the outer layer consisting of welded segments of gutta-percha, and a yielding filling held under compression by said shell.

29. A playing-ball comprising a shell consisting of a perforated inner layer consisting of separated segments of celluloid, an outer layer consisting of welded segments of gutta-percha, the material of said outer layer penetrating said perforations; and a yielding filling held under compression by said shell.

30. A playing-ball comprising a shell consisting of an inner layer of celluloid and an outer layer consisting of welded segments of gutta-percha; said layers being interlocked; and a rubber sphere held under compression by said shell.

81. A playing-ball comprising a shell consisting wholly of two layers, the inner layer being perforated and the material of the outer layer penetrating the perforations; said outer layer being materially thicker than said inner layer and also of softer material; and a rubber shell held under compression by said shell and provided with a hard, springy center piece.

82. A playing-ball comprising a filling and a shell thereon consisting of welded segments of plastic material having embedded therein separated and distinct perforated segments of other plastic material.

83. A playing-ball comprising a filling and a shell thereon consisting of welded segments of plastic material having embedded on its inner side separated and distinct perforated segments of other plastic material.

701,742. GRANULAR MALTED BISCUIT AND METHOD OF MAKING SAME. JOSEPH LAMMER, Battle Creek, Mich. Filed Nov. 7, 1901. Serial No. 81,482. (No specimens.)

Claim.—1. As a new article of manufacture, a food product made from a leavened dough containing malted-barley flour and whole-wheat flour, said product being in molded form baked and dextrinized, coarsely granular, friable and readily absorbent and containing extract of malt for holding the granules together, substantially as described.

2. As a new article of manufacture, a food product made from leavened dough containing malt-flour and whole-wheat flour, baked and dextrinized, in the form of biscuits which are coarsely granular, friable and readily absorbent, and containing a digestive agglutinant for holding the granules together, substantially as described.

3. The herein-described process of producing a granular food-biscuit which consists in mixing malt-flour with whole-wheat flour and adding thereto water, salt, shortening and a leavening agent, to form a dough and allowing the dough to properly leaven, then forming into leaves and baking, then slicing, and browning or toasting said slices, next reducing to granular condition by grinding or crushing, next adding a digestive agglutinant, then molding into suitably-shaped biscuits or cakes, and then drying out, substantially as described.

4. The herein-described process of producing a granular food-biscuit, which consists in mixing malted-barley flour with whole-wheat flour, and adding thereto water, salt, shortening and a leavening agent to form a dough, and allowing the dough to properly leaven, then forming into leaves and baking; then slicing and toasting said slices, next reducing to granular condition, then adding extract of malt, then molding into suitable shapes and then drying out by rebaking, substantially as described.

5. The process of producing a granular food product which consists in taking malt and removing the hulls therefrom and grinding it into flour, mixing it with a suitable quantity of wheat-flour; then making a dough of the mixed flour by adding water, salt, shortening and leavening, permitting the same to properly leaven; then forming into leaves of suitable size and shape and baking the same; then cutting into thin slices, then browning or toasting the slices and reducing the thus browned or toasted slices into granules by grinding or crushing, and mixing the granules with extract of malt for causing the granules to adhere, and then rebaking, substantially as described.

701,743. PAINT. THOMAS L. LEE, Memphis, Tenn., assignor of one-half to Graham Martin, Edgar Lee, and Thomas L. Lee, Jr., Memphis, Tenn. Filed Jan. 12, 1902. Serial No. 80,533. (No specimens.)

Claim.—The herein-described paint composition consisting of distilled coal-oil, dead-oil, refined benzol, and Chickasaw oil, mixed in or about the proportions described.

701,744. WOMAN'S DRAWER. HENRY M. LOVE, Wilmington, Del. Filed Mar. 12, 1902. Serial No. 97,571. (No model.)

Claim.—1. A pair of knitted drawers having seamless legs and a body portion with central seam and overlapping diagonal flaps, substantially as specified.

2. A pair of knitted drawers having seamless legs and a body portion with open crotch, central seam and overlapping diagonal flaps, substantially as specified.

3. A pair of knitted drawers comprising a pair of seamless tubular webs diagonally slitted in their upper portions and having corresponding edges of these diagonal slits secured together, substantially as specified.

701,745. LUBRICATOR. RICHARD A. LYDGE, Richmond, Mich. Filed Nov. 27, 1901. Serial No. 82,578. (No model.)

Claim.—1. In a lubricator for connection with an air-cylinder, a casing having an inlet and an outlet adapted to communicate with the interior of said cylinder, an impermeable, cylindrical plunger of uniform diameter throughout its length and having a sliding fit in said casing and arranged to close at all times said inlet and to reciprocate in said casing solely by the action of the piston of said cylinder and a reservoir for a lubricant in communication with said casing through said inlet and the latter being transverse to, and between, the ends of the piston.

2. In a lubricator for connection with an air-cylinder, a casing having an inlet, plugs screw-threaded into the opposite ends of the casing and one of the plugs having a screw-threaded extension having a bore constituting an outlet for said casing, an impermeable, cylindrical plunger of uniform diameter throughout its length and having a sliding fit in said casing and arranged at all times to close said inlet and to reciprocate in said casing solely by the action of said piston of said cylinder and a reservoir for a lubricant in communication with said casing through said inlet.

3. In a lubricator for connection with an air-cylinder, a casing having an inlet and screw-threaded plugs in its opposite ends, one of the plugs having a groove at its inner end and a longitudinal bore, a plunger having a sliding fit in said casing and arranged to close at all times said inlet and to reciprocate in said casing solely by the action of the piston of said cylinder and a reservoir for a lubricant in communication with said casing through said inlet.

4. In a lubricator for connection with an air-cylinder, a casing having a single inlet and a single outlet adapted to communicate with the interior of said cylinder, a plunger having a sliding fit in said casing and arranged to close at all times, said inlet and to reciprocate in said casing solely by the action of the piston of said cylinder, and said inlet being transverse to, and between, the ends of the plunger, and means for supplying a lubricant to the casing through said inlet.

701,746. BOAT STOPPING AND HOLDING DEVICE. PHILIP H. MALONEY, Philadelphia, Pa. Filed May 20, 1901. Serial No. 82,947. (No model.)

Claim.—1. An inclined frame for stopping and holding boats pivoted at its lower end beneath the water-level and provided with means for raising and lowering the upper end.

2. An inclined frame for stopping and holding boats pivoted at its lower end beneath the water-level and provided with pivoted arms for raising and lowering the upper end.

3. An inclined frame for stopping and holding boats pivoted at its lower end beneath the water-level and provided with arms for raising and lowering the upper end, said arms being revolvably mounted on a bar and carrying rollers bearing against the under side of said frame.

4. An inclined frame for stopping and holding boats pivoted at its lower end beneath the water-level and provided with spreading-arms rev-

ably mounted on a bar said bar being provided with an operating-lever and holding-rook.

701,747. **BIKYLE.** GEORGE W. HANSON, New York, N. Y. Filed Nov. 17, 1902. Serial No. 24,943. (No model.)

Claim.—The combination of the handle-bar, formed with rearwardly-projecting arms 26, the handles 28 separately adjustable longitudinally of said arms, the seat 10, 10' adjustable in height and longitudinally on the inclined standard 1' and the rearwardly-inclined pendant pedal-levers 13 mounted on a suitable frame, substantially as described, to enable the adaptation of the machine for advantageous use by riders of different arm-reach and stature.

701,748. **BIKYLE DRIVING MECHANISM.** GEORGE W. HANSON, New York, N. Y. Filed Nov. 17, 1902. Serial No. 24,944. (No model.)

Claim.—The combination of a suitable cycle-frame, a pair of pendant

pedal-levers 13 hung from their upper ends to the frame so that they swing forward and back in paths which are mainly in the rear of a vertical line from their fulcrum-pivots in the forward part of the frame, pedals 14 mounted on the lower ends of said levers, connecting-rods 15 pivoted to the pedal-levers at their forward ends, crank-arms 16 to which the rear ends of the connecting-rods are respectively pivoted, a crank-shaft 17 on the extremities of which the crank-arms 16 are mounted, gear-wheel 40 keyed thereon; gear-wheel 41 driven by the wheel 40; shaft 42 on which the wheel 41 is fixed; gear-wheel 43 also fixed on shaft 42; pinion 44 driven by the wheel 43; shaft 45 on which the pinion 44 is fixed; gear-wheels 46 and 49 of different diameters fixed on the shaft 45 and driven thereby; loose pinions 47 and 50 driven by the wheels 46 and 49 respectively; and having clutch-teeth on their opposed faces; sprocket-wheel shaft 48 on which the pinions 47 and 50 are loosely mounted; sprocket-wheels 18, 20 and chain 19 transmitting motion from the shaft 48 to the drive-wheel 8; sliding clutch-clove 51, 51', 51'', splined on shaft 48 so as to drive the same; and means for shifting the said clutch-clove into engagement with either of the pinions 47 and 50, or out of engagement with either so as to drive the sprocket-wheel shaft 48 at variable speed or permit it to run free, substantially as described.

701,749. **MATTRESS-SEWING MACHINE.** HARRISON S. HARTMAN, Washington, D. C. Filed Nov. 12, 1902. Serial No. 611,393. (No model.)

Claim.—1. The combination with a horizontal rest or table to support the lower edge of a mattress, and tracks arranged at one side thereof, of a sewing-machine mounted on said tracks and having an angular guide-plate overhanging said rest or table to receive the upper, inner corner of a mattress; obliquely-angled needle-apertures being formed in the vertical and horizontal members of said guide-plate, a pivoted vertically-vibrating lever having a needle-head at its outer end above said guide-plate and provided with a needle to pass through said apertures and stitch the upper, inner corner of a mattress, a loop adjacent to the lower inner aperture, and means for operating and feeding the machine, substantially as specified.

2. In a machine of the class described, the combination with a framework having a track, of a machine-housing mounted for movement upon the track and having an overhanging right-angular plate at its lower-front edge, a lever fulcrumed at its upper end in the rear end of the housing and at its front end having a needle-carrying head, a hollow machine-head coincidentally curved with relation to the pivot of the lever and in line with needle-openings in the plate and serving as a guide for the needle-carrying head, a shaft journaled in the housing, a loop carried by the shaft and arranged adjacent to the path traversed by the needle, a crank formed in the shaft and a pinion-rod loosely connected to the crank and to the lever, and means for rotating the shaft and advancing the machine, substantially as specified.

3. In a machine of the class described, the combination with a housing provided at its lower front part with an angular plate having openings at opposite sides of its angle and above the same having a hollow, slotted machine-head, a needle-carrying head arranged in the latter, a lever fulcrumed in the housing and connected to and adapted to operate the needle-carrying head, a transverse shaft journaled in the housing in rear of the angular plate, means for conveying motion from the same to the lever for vibrating the latter, a loop arranged on the shaft adjacent

to the lower needle-opening in the angular plate, and eyes on the lower end of the bearing for loosely receiving the track, of a power-shaft journaled at an angle to the horizontal shaft, a gear-wheel on each of said shafts and intermeshing with each other and means for driving the power-shaft and advancing the machine, substantially as specified.

4. The combination with a rest-table to support the lower edge of a mattress, and tracks arranged parallel thereto and at one side thereof, of a sewing-machine having an angular portion arranged above and overhanging said rest-table, said angular portion being provided with obliquely-angled openings, a needle-carrying head arranged in the machine and provided with a needle, said needle-carrying head being inclined downwardly and inwardly with relation to the table, whereby the needle is adapted to pass through the oblique openings and stitch through the upper corner of the mattress, a lever cooperating with the needle, and means for operating said needle and lever.

701,750. APPARATUS FOR USE IN THE TREATMENT OF COFFEE.
 FRED. HERMAN & HAZEN, London, England. Filed Sept. 2, 1891. Serial No. 74,827. (No model.)

Claim.—1. In apparatus for treating coffee, the combination with a roasting-chamber, of an absorbing-chamber detachably connected therewith, of means for rotating the chamber, of means for opening and closing communication between them, of means for heating the roasting-chamber, of a condenser for condensing and collecting the steam and gases arising during the initial heating of said roasting-chamber, of means for disconnecting the condenser from the said roasting-chamber, of means for indicating the pressure in the roasting-chamber, and of means for enabling the contents of the roasting-chamber to be quickly discharged into the absorbing-chamber for the purpose specified.

2. In apparatus for treating coffee, the combination with a roasting-chamber, of an absorbing-chamber detachably connected thereto, of a valve capable of being actuated from the exterior of the apparatus for opening and closing communication between said chambers, of a governor for heating the roasting-chamber, said governor being substantially concentric with the roasting-chamber and being hinged for movement about a vertical axis to permit of its being tilted from its heating position, of a gage for indicating the pressure in said roasting-chamber, of a frame in which the chambers are rotatably mounted, of bearings carrying said frame so that it can be turned into a vertical position, and of means for temporarily maintaining said frame in a substantially horizontal position during the rotation of the chambers and the heating operation as described.

3. In an apparatus for treating coffee, the combination with an absorbing-chamber, of a perforated partition for dividing the chamber into a plurality of compartments and each of the latter having an inlet and a valve common to said inlet.

4. In apparatus for treating coffee, the combination with the absorbing-chamber, of a rotatable or perforated cylindrical partition for

dividing this chamber into two concentric compartments, and of a valve serving the double purpose of opening and closing this chamber and of opening and closing the communication between the two concentric compartments for the purpose specified.

5. In an apparatus for treating coffee, the combination with a roasting device, of means for imparting motion to the coffee-barrier while in said roasting device, an absorbing-chamber in communication with the roasting device, means for separating the chamber into a plurality of compartments, the separating means being such that different kinds of grains can be kept out of contact while in said absorbing-chamber and each compartment having an inlet, and a valve common to said inlet.

6. In an apparatus for treating coffee, the combination with a roasting device, of an absorbing-chamber, a perforated device for separating the chamber into a plurality of compartments having an inlet, and a valve common to said inlet.

7. In apparatus for treating coffee, the combination with the absorbing-chamber and its rotatable or perforated cylindrical partition, of a plug or valve operated from the exterior of the chamber and having a cylindrical portion for opening and closing the connection between the two concentric compartments and also having a seating-surface for closing the opening in the said chamber substantially as and for the purpose specified.

8. In an apparatus for treating coffee, an absorbing-chamber having a valve-controlled opening through which the gaseous contents can be withdrawn, and a rotatable device separating the said chamber into a plurality of compartments each of which has an inlet.

701,751. FASTENING DEVICE FOR DRIVING-BORERS. FRED. MAYNOR, Wells, Wash., assignor to himself and Richard Holman, Wells, Wash. Filed Nov. 12, 1891. Serial No. 81,550. (No model.)

Claim.—1. A fastening device, comprising a supporting-frame; a spindle mounted to turn in the supporting-frame; a pin-holding disk carried by the spindle; a ratchet carried by the spindle; a pawl engaging the ratchet; a spring-pressed rod connected with the spindle; a tube in which the said rod is received; a gear carried on the end of the tube; a gear on the vehicle-wheel, said gear meshing with the tube-gear; and a lever mounted on the rod and connected with the tube.

2. A pin-holder, comprising a supporting-frame; a pin-fastening device mounted to turn in the supporting-frame; means for preventing the rotation of the pin-fastening device in one direction; a spring-pressed rod connected with one end of the pin-fastening device; a tube within which the rod is received; a gear carried on the end of the tube; a gear on the vehicle-wheel; said gear meshing with the tube-gear; and a lever mounted on the rod and connected with the tube.

3. A pin-holder, comprising a supporting-frame; a pin-fastening device mounted to turn in the supporting-frame; means for preventing the rotation of the pin-fastening device in one direction; a spring-pressed rod connected with one end of the pin-fastening device; and a tube within which the rod is received, said tube being operatively connected with a wheel of a vehicle.

4. In a rein-holder, the combination of a spindle and two telescoping members, one of which is connected with the spindle and the other of which is adapted to be engaged with or disengaged from a vehicle-wheel.

5. A rein-holder, comprising a supporting-frame; a rein-fastening device mounted to turn in the supporting-frame; a spring-pressed rod connected with one end of the rein-fastening device; a tube within which the rod is received, said tube being operatively connected with a wheel of the vehicle; and means for disconnecting the tube and the said wheel.

701,753. CARD-INDEX-FLIPING TRAY. ARAN E. MILLER, Muskegon, Mich., assignor to the Shaw-Walker Company, Muskegon, Mich. Filed Aug. 29, 1901. Serial No. 73,000. (No model.)

Claim.—In combination, a tray having the inner face of its side walls provided with grooves, a follower, a tongue extending from each side of the follower and engaging in the grooves, a spring mounted within the follower and extending from each side thereof and engaging in the grooves for locking the follower in position, and means carried by the spring and projecting through the back of the follower and adapted when operating to release the spring thereby releasing the follower.

701,758. BURGLAR-ALARM. WILFRED E. HENRY, Dallas, Tex., assignor to Thomas J. Husted, Dallas, Tex. Filed Apr. 15, 1902. Serial No. 109,001. (No model.)

Claim.—1. A burglar-alarm, consisting of a body adapted for attachment to a support, an arm extending from the body and provided with a barrel-section to receive a cartridge-shell, a dotted locking-plate at one end of the body, a spring-lever secured at one end to the body, its opposite end extending freely in front of the barrel-section of said arm, a hammer carried by the free portion of the said spring-lever, and a locking-lever pivoted upon the locking-plate, having members adapted to bridge the slot in the said plate, for the purpose set forth.

2. In a burglar-alarm, the combination with a body plate or bar, an arm projected from the body plate or bar at a point between its ends, extending for a portion of its length at right angles to the body plate or bar, the outer end of the arm being inclined in direction of one end of the body plate, the said inclined outer end of the arm having an opening therein to receive a cartridge, and a locking-plate located at that end of the body plate or bar adjacent to the inclined end of the said arm and extending in direction of the inclined end of the arm, said locking-plate being provided with a slot in its outer end, of a spring-lever consisting of a spring-wire secured at one end to the body plate or bar where it connects with the said arm, the said wire having a coil formed therein adjacent to the arm and its opposite end carried at one side of the arm in direction of and above the locking-plate, a hammer secured to the upper

member of the said spring-lever, which hammer is adapted to strike the cartridge when in the barrel-section of the said arm, that portion of the spring-lever above the hammer being adapted in the cocked position of said hammer to enter the slot in the locking-plate, and a T-shaped locking-lever pivoted on the locking-plate, the head-section of the said T-lever having legs at an angle to the head-section, either of which legs is adapted to bridge the slot in the locking-plate, for the purpose set forth.

701,754. SAFETY FUEL-TANK FOR AUTOMOBILES. THOMAS W. BIRDA, Louisville, Ky. Filed Mar. 23, 1901. Serial No. 68,888. (No model.)

Claim.—1. A safety fuel-tank connected with a source of pressure, and provided with a feed-pipe to a burner, said tank having a valve device consisting of two tubular members, each member having a chamber, and an annular shoulder or abutment in rear of said chamber, one of said members having a valve-seat at its inner extremity, the screw-threads connecting said members together, the coil-springs in the chambers of said members, and having a bearing against said abutments, and the ball-valve between said springs, and locked thereby, substantially as specified.

2. A safety fuel-tank for automobiles connected with a source of pressure, and provided with a feed-pipe to a burner, said tank having a valve device consisting of the two members, each chambered for the reception of a coil-spring, one of said members having a valve-seat at its inner extremity, the screw-threads connecting said members together, the coil-springs in the chambers of said members, the valve between said springs, and means for forcing said valve from its seat when required, substantially as specified.

701,755. OIL OR GASOLINE CAN. LEWIS E. HENRY, Dallas, Tex., and CHARLES L. SCHUBERT, Dallas, Tex. Filed Feb. 4, 1902. Serial No. 92,700. (No model.)

Claim.—In an oil-can, the combination with a can provided with a cover, of a pump-barrel mounted in said can and passing through said cover, a pump mounted in said barrel and constructed to raise oil, a cap surrounding the upper end of said barrel and constructed to catch the oil raised by said pump, a larger cap containing said smaller cap and designed to catch the overflow therefrom, a tube fitting transverse apertures in said caps, an L-shaped spout rotatably mounted in said tube, and a housing surrounding the outer end of said tube, there being apertures in said cover within said housing to permit the return to the can of leakage through said tube, substantially as described.

701,756. FOOT-WARNER. JAMES P. McANUS, Richmond, Ala. Filed Feb. 24, 1902. Serial No. 95,504. (No model.)

Claim.—1. A foot-warmer comprising casing having an open front side, a central flue disposed within said casing and dividing the same into side compartments which have communication with said flue, heads for

the side compartments, and means for closing the front portions of said compartments.

2. A hot-warmer comprising a casing having the side compartments, a vertical line disposed between the side compartments and separating them one from the other, ports or openings in the sides of said vertical line and establishing communication between said line and said compartments, and a front plate fitted removably in the casing and closing the front portions of both side compartments.

3. A hot-warmer comprising a casing divided to form side compartments, and an intermediate vertical line in communication with said compartments, suitable heaters in the side compartments, and hoods fitted removably in the casing, on opposite sides of the line, and closing the upper portions of side compartments.

4. A hot-warmer comprising a casing having side compartments, a control line in communication with the compartments, and a front plate fitted removably in guides provided within the casing, said line having a curved portion adapted to form a foot-rest which is exposed outside of the compartments.

5. A hot-warmer comprising a casing, side compartments, each closed at its upper part by a removable hood, a front plate fitted removably within the casing and extending across the side compartments, a control line communicating with the compartments and opening through the top of the casing, and means provided on the casing at one side of the line-opening for the attachment of a wire.

701,757. WHEAT AND PRESSURE RECORDING APPARATUS.
EDWARD H. HARRIS, Baltimore, Pa., assignor to John J. Walsh, Hugh A. Taylor, Sidney Kravitz, Guy C. Linn, Edward McGarvey, James F. Adams, Robert E. Taylor, and Ellis L. Davis, Baltimore, Pa. Filed May 25, 1901. Serial No. 61,325. (No model.)

Claim.—1. In a weight and pressure recording apparatus, a printing device, electrically-operated means for moving an impression-receiving strip relatively to the printing device, and a circuit-controller for said electrically-operated means, carried by and movable on a scale-beam, substantially as specified.

2. In a recording device, printing device, electrically-operated means

for imparting forward motion to the printing device, electrically-operated means for imparting reverse motion to the printing device, and a circuit-controller for said electrically-operated device, carried by a scale-beam, substantially as specified.

3. In a weight and pressure recording apparatus, printing device, a reel for supporting a strip to be printed upon, electrically-operated means for imparting reverse motion to the printing device, electrically-operated means for moving said strip, a plate for pressing the strip against the printing device, and means carried by a scale-beam and movable thereon for controlling the electrically-operated device, substantially as specified.

4. In a weight and pressure recording apparatus, printing-wheel, electrically-operated device for moving said printing-wheel in opposite directions, an electrically-operated feeding device for a strip of material to be printed upon, an electrically-operated plate for pressing the strip against the printing-wheel, an ink-roller, and means carried by and movable along a scale-beam for controlling the electric circuit, substantially as specified.

5. A weight and pressure recording apparatus, two series of rotary printing devices, electric motor for operating said printing devices, upper and lower scale-beams, and devices carried by said scale-beams for controlling respectively the motor for the printing device, substantially as specified.

6. In a weight and pressure recording apparatus, a series of printing-wheel, a driving frame, an ink-roller carried by said frame, ratchet-wheel arranged on the shaft of the printing-wheel, the teeth of said ratchet-wheel being revolved in relation, a pawl for engaging with either one of said ratchet-wheel, an electromagnet for operating said pawl, an electromagnet for moving the pawl from one of said ratchet-wheel to the other, and means carried by a scale-beam for controlling the electric circuit through said electromagnets, substantially as specified.

7. In a weight and pressure recording apparatus, a series of printing-wheel, a shaft on which said wheels are mounted, ratchet-wheel on said shaft, the teeth of the two wheels being in reverse order, a finger for engaging with the teeth of either one of the ratchet-wheel, an armature carrying said finger, an electromagnet coacting with the armature, an electromagnet, the armature of which has a spring-yielding connection with said finger, the said last-named electromagnet being a reversing-magnet, a source of electricity in which the two magnets are arranged, and means carried by and moving along a scale-beam for controlling the circuit through the magnets, substantially as specified.

8. A scale-beam having notches formed in its upper edge, a point movable along said scale-beam, a contact-finger carried by the point and adapted to make and break electrical connections when passed along the notched portion of the beam, and a recording device in the electric circuit controlled by said movable point, substantially as specified.

9. Upper and lower scale-beams, two series of printing-wheel, electric motor for operating said wheels, one series independently of the other, electric motor for causing the reverse movements of the wheels, one series independently of the other, a point movable along the upper beam and adapted to control the current through one of the first-named electric motor and its coacting reversing-motor, and a point movable along the other beam for controlling the current through the other two electric motor, substantially as specified.

10. A scale-beam, a point movable along the same, a spring-yielding contact-point carried by said point but insulated therefrom and adapted to be pressed into electrical connection with the point, a series of printing-wheel, a reversing-electromagnet for the printing-wheel, the said electromagnet being in connection with the spring-contact carried by the point and also in electrical connection with the point, and means electrically operated and controlled by movements of said point for imparting a forward movement to the printing-wheel, substantially as specified.

11. A scale-beam, a point movable along the same, a wheel carried by said point and having alternating contact-points and insulating-points in its periphery, a brush engaging with said wheel, a driving connection between said wheel and the beam, a series of printing-wheel, an electromagnet for imparting motion to said wheel, and a source of electricity in which the electromagnet and the brush and point are arranged, substantially as specified.

12. A scale-beam, a series of rotary printing device, an electric motor for operating said device, a source of electricity in which said motor is located, a plate, a motor for operating said plate, the said motor being arranged in the source of electricity, a point on the scale-beam, and circuit-closing device carried by said point, the said circuit-closing device being in the source of electricity, substantially as specified.

701,758. GAL-LINE. EDWARD F. HARRIS, Lake Placid, Minn., assignor to one-half to Oscar Redford, St. Paul, Minn. Filed Mar. 25, 1901. Serial No. 61,326. (No model.)

Claim.—In an ear-lock, the combination with the block 12 having a vertical hole in the shank of the fork or ear-lock proper, of a fork having a shank with an annular recess or groove, said block also having a cavity 25 in one side and a plate 24 covered over the same; the U-shaped wire 21 22 23 having a short arm engaging the groove in the shank of the fork, and a long arm extending horizontally, transversely through and beyond the opposite side of the block, where it serves as a push-button to disengage the short arm from the groove, the spring 27 inserted between the head 21 of the wire and the spring-retaining plate 24, substantially as and for the purpose set forth.

701,759. EAR LOCK. GEORGE C. McWILL, Chandlerville, Ill. Filed Oct. 28, 1901. Serial No. 71,737. (No model.)

Claim.—1. The combination with a row-beat, of an ear-lock comprising an inwardly-turned hook secured to the inner surface of the side of the beat, an ear comprising two sections having a gear connection and plates between which the gears are supported one of said plates having depending ears connected by a cross-rod engaging under the hook.

2. The combination with a row-beat, of an ear-lock comprising an inwardly-turned hook secured to the inner surface of the side of the beat to ear comprising two sections having a gear connection, plates between which the gears are supported one of said plates having depending ears connected by a cross-rod engaging under the hook, and a spring-dog for retaining the cross-rod in engagement with the hook.

701,760. WIRE-FENCE TOOL. WILLIAM HENRY BERRY, Tex. Filed Sept. 18, 1901. Serial No. 74,905. (No model.)

Claim.—A tool of the character described, comprising a straight rod or bar provided with a laterally-projecting head formed with an eye, said head being provided with a reduced neck portion and a wire-cutting edge, and being secured to said bar at a point intermediate its ends, whereby the outer end of the rod or bar forms a fulcrum, substantially as set forth.

701,761. CYCLE PROPPELLING MECHANISM. CHRISTIAN GRUBB, Stoughton, Wis. Filed Mar. 1, 1904. Serial No. 49,454. (No model.)

Claim.—1. In a bicycle propelling mechanism of the like, handle-bars having independent oscillating movement, a connecting-lever having connection with each of said handle-bars whereby movement of one is transmitted to the other, and operative connection between said handle-bars and the driving-wheel.

2. In a bicycle propelling mechanism of the like, handle-bars having independent oscillating movement, a housing upon each of said handle-bars, a connecting-lever pivoted between said housings and having its ends received in and engaged by said housings, and operative connection between said handle-bars and the driving-wheel.

3. In a bicycle propelling mechanism of the like, a handle-bar post, handle-bars mounted thereon and having independent oscillating movement, a connecting-lever pivotally supported upon said handle-bar post, connections between said handle-bars and the respective lever-arms for transmitting movement from one of said handle-bars to the other, and operative connection between said handle-bars and the driving-wheel.

4. In a bicycle propelling mechanism of the like, a clotted handle-bar head, a bolt-head having an eye and fitting between the parts of said handle-bar head, a bolt upon said bolt-head, a connecting-lever pivoted upon said bolt, a supporting-rod extending through said handle-bar head and through the eye of said bolt-head, and handle-bars mounted upon said supporting-rod.

5. In a bicycle propelling mechanism of the like, a handle-bar head having shoulders on opposite sides thereof, a bolt-head mounted on the handle-bar head and having laterally-extending ribs, a washer engaging said bolt-head and ribs, and the shoulders on the handle-bar head, whereby oscillation of said bolt-head is prevented, a bolt upon said bolt-head, and a lever upon said bolt.

6. In a bicycle propelling mechanism of the like, a handle-bar head having a recess therein, and shoulders on either side thereof, a bolt-head in said recess, a bar extending through said handle-bar head and said bolt-head, a washer engaging said bolt-head and extending over the same and upon the sides of the handle-bar head, said washer also engaging the shoulders upon the handle-bar head upon opposite sides of the said bar, a bolt upon said bolt-head and a lever upon said bolt; and handle-bars pivotally supported on the bar and engaging with the ends of said lever.

7. In a bicycle propelling mechanism of the like, the combination with a steering-head and driving-wheel, of a handle-bar made in two parts each capable of independent oscillating movement, an operating-lever clamped upon one part of said handle-bar and extending upon opposite sides thereof, an oscillatory lever connecting the two parts of the handle and interconnecting with one arm of the lever, and operative connections between the other arm of the lever and the driving-wheel.

8. In a bicycle propelling mechanism of the like, a handle-bar, an operating-lever having side plates connected together at one end, a block between the opposite ends of said side plates, a connecting-rod secured in said block, said lever being secured to the said handle-bar intermediate its ends, and a lever-operating member received between and engaged by the side plates between the handle-bar and the said connected ends of said plates.

9. In a bicycle propelling mechanism of the like, a handle-bar, a pedal-clamp upon the side of said handle-bar opposite the head and extending beyond the body portion of the handle, and a connecting-rod upon said handle and received between the head and the said clamp.

10. In a bicycle propelling mechanism of the like, the combination with a pedal-clamp, of a clamp comprising base-plates adapted to overlap, a plurality of complementary clamping members upon each of said base-plates, curved to fit said spindle, means located between the outer bearing edges of said clamping members for securing said base-plates together and an actuating-rod secured to said clamp.

701,762. ENGINE-GOVERNOR. JOHN F. VERN, St. Louis, Mo., assignor of one-half to Pullen Iron Works, St. Louis, Mo., a Corporation of Missouri. Filed July 20, 1901. Serial No. 69,619. (No model.)

Claim.—1. An engine having an inlet-valve, a dash-pot connected to said valve, suitable latching mechanism engaging said dash-pot, a governor, suitable connection between said governor and latching mechanism for tripping the latter when the engine reaches abnormally high speed; in combination with an auxiliary governor and suitable connection between said auxiliary governor and said latching mechanism for tripping the latter should said first-named governor fail to act.

2. An engine having an inlet-valve, a dash-pot connected to said valve, suitable latching mechanism engaging said dash-pot, a governor, a cam-disk adapted to be moved by the said governor to trip the latching

mechanism when the engine reaches abnormally high speed; in combination with an auxiliary governor, a cam-ring located within the first-mentioned ring and adapted to be moved by said auxiliary governor to trip the latching mechanism should the first-mentioned governor fail to act.

3. An engine having an inlet-valve, a dash-pot connected to said valve, suitable latching mechanism engaging said dash-pot, a governor, a cam-ring adapted to be moved by the governor to trip the latching mechanism when the engine reaches abnormally high speed; in combination with an auxiliary governor, a cam-ring located within the first-mentioned ring, an adjustable cam upon said inner ring, said cam adapted to be moved by said auxiliary governor and to trip the latching mechanism should the first-mentioned governor fail to act.

4. In an engine, the combination of the inlet-valve, governor and dash-pot; with latching mechanism engaging said dash-pot and a cam operated by said governor and tripping said latching mechanism to cause the steam-inlet valve to shut off the supply of steam when the engine reaches an abnormal rate of speed, of an auxiliary governor and a second cam operated by said auxiliary governor and tripping said latching mechanism in the event that the first-mentioned governor fails to act.

5. In an engine, the combination of an inlet-valve, a dash-pot connected to said valve, suitable latching mechanism engaging said dash-pot, a governor, an auxiliary governor, cam-rings, mounted one within the other upon said valve-stem, one upon said rings adapted to trip said latching mechanism, suitable connection between the first-mentioned governor and the exterior of said rings, whereby when the engine reaches abnormal speed said latching mechanism will be tripped, suitable connection between the auxiliary governor and the interior of said rings whereby said latching mechanism will be tripped if the first-mentioned governor fails to act.

6. In a double engine having a plurality of inlet-valves, a dash-pot connected to each of said valves, suitable latching devices for said dash-pots, a governor, suitable connection between said governor and latching devices for tripping the latter when the engine reaches abnormally high speed, an auxiliary governor, suitable connection between said auxiliary governor and said latching devices for tripping the latter should said first-mentioned governor fail to act.

701,768. CARTRIDGE. JAMES CHERRY, Bridgeport, Conn., assignor to the Union Metallic Cartridge Company, Bridgeport, Conn., a Corporation of Connecticut. Filed Feb. 24, 1898. Serial No. 56,078. (No model.)

Claim.—A cartridge having a ground wall and a grease-proof wall interspersed between the bullet and the powder, the grease-proof wall being composed of polyboard having a glazed grease-proof surface and fitting

snugly in the cartridge-shell and located between the powder and the ground wall.

701,764. REVOLVING CAR-DUMPING STRUCTURE. RICHARD RAINAY, Birmingham, Ala. Filed Dec. 12, 1898. Serial No. 52,708. (No model.)

Claim.—1. The combination with fixed track-rails, of a revolvable car-dumping structure provided with rails in alignment with the fixed track-rails and so arranged with relation to the axis of rotation of said dumping structure that the coupling-points of the cars will substantially coincide with the said axis of rotation, a hauling-rope connected to the cars substantially in line with said coupling-points, means for holding the cars in fixed relation to the dumping structure, and means for rotating said structure whereby one or more cars may be dumped by rotation of the dumping structure without uncoupling said cars from other cars, substantially as described.

2. The combination with fixed track-rails, of a revolvable car-dumping structure provided with rails in alignment with the said fixed track-rails and so arranged with relation to the axis of rotation of the said dumping structure that the coupling-points of the cars and the hauling-rope will substantially coincide with the axis of rotation of the dumping structure, a hauling-rope connected to the cars substantially in line with said coupling-points, means for holding the cars in fixed relation to the dumping structure, and means for rotating said structure whereby one or more cars may be dumped without detachment from the hauling rope or other cars, substantially as described.

3. The combination in a revolving car-dumping structure, of a revolvable structure consisting of a series of rings, side plates extending partly around and uniting said rings into a rigid structure of sufficient length to receive and hold one or more cars, a series of independent brackets secured to the opposite sides of the interior of said structure and having self-supporting ledges thereon, track-rails supported by ledges on said brackets, guard-rails carried by other ledges on the said brackets for holding the cars in fixed relation to the revolvable structure as it revolves, and means for causing said structure to revolve and dump the cars, substantially as described.

4. The combination, in a revolving car-dumping structure, of a revolvable structure having rails therein for receiving and holding a plurality of cars and guard-rails for holding the cars in fixed relation to the structure as the latter revolves, a ring on said structure, two ropes attached to the periphery thereof and leading in opposite directions, and a motor-cylinder having its piston-rod connected to one of the ropes on each side of the structure, substantially as described.

5. The combination, in a revolving car-dumping structure, of a revolvable structure comprising a series of rings, side plates extending partly around and uniting said rings into a rigid structure having an opening for

the passage of material, brackets secured to the inside of the structure, track-rolls mounted upon the brackets upon which the case may be run, guard-rolls for maintaining said case in fixed relation to the structure, a ring on said structure provided with grooves, ropes secured to said grooves and leading in opposite directions, a fixed frame upon which the reversible structure is rotatably mounted, guide-wheels over which the ropes lead, and a motor on each side of the structure having its piston-rod connected to one of the ropes, substantially as described.

6. The combination of a reversible car-dumping structure adapted to receive and hold a plurality of cars mounted upon a suitable frame and having an opening through which the material may pass from the cars, rails in said structure for receiving the cars, means for holding the cars in fixed relation to the structure, a conveyor-belt operating below the structure to receive the material as it is dumped from the cars when the structure is revolved, and means for revolving the structure, substantially as described.

7. The combination of a reversible car-dumping structure adapted to receive and hold a plurality of cars mounted upon a suitable frame and having an opening through which the material may pass from the cars, rails in said structure for receiving the cars, means for holding the cars in fixed relation to the structure, a conveyor-belt operating below the structure to receive the material as it is dumped from the cars when the structure is revolved, means for receiving the material from the conveyor, and means for revolving the structure, substantially as described.

8. A reversible car-dumping structure comprising a series of rings having internal lateral flanges at opposite sides, each extending partly around the periphery of the ring, plates secured to said flanges and making the rings into a rigid structure, brackets secured to the flanges of the rings and to the plates and having rail-supporting shelves or ledges, rails secured to said shelves or ledges, substantially as described.

701,785. GOLF-BALL. FRANK H. BERNARD, Hartford, Conn., assignor to The Kumpshall Manufacturing Company, a Corporation of New Jersey. Filed Mar. 24, 1922. Serial No. 99,091. (No model.)

Claim.—1. A playing-ball comprising a shell compounded of fibrous material and celluloid, said shell being distended by a mobile mass of solid material injected therinto.

2. In a playing-ball, a spherical shell consisting at least partially of fabric and celluloid and distended by plastic material injected therinto.

3. In a playing-ball, a shell formed of a plurality of layers of celluloid and an intervening fabric layer; said shell being distended by a core of gutta-percha injected therinto.

4. In a playing-ball, a shell having a plurality of layers of fabric and a plurality of layers of celluloid, and distended by a core of gutta-percha injected therinto.

5. In a playing-ball, a shell formed of a plurality of layers of fabric compounded with plastic material and distended by a core of plastic material injected therinto.

6. In a playing-ball, an embossed shell formed of fabric and celluloid and distended by a gutta-percha core injected therinto; and a plug filling the injection-hole in the shell.

7. A playing-ball comprising an embossed shell of plastic material and fabric, said shell being distended by a core of plastic material injected therinto.

8. A playing-ball comprising a shell of fabric and celluloid, said shell being distended by a mobile mass of solid matter injected therinto; and a layer of soft rubber intervening between said shell and said injected material.

9. In a playing-ball, a spherical shell consisting at least partially of fibrous material and celluloid and distended by plastic material injected therinto; and a layer of tensioned soft rubber intervening between said shell and said injected material.

10. In a playing-ball, a shell formed of layers of celluloid and layers of fabric; said shell being distended by a core of gutta-percha injected therinto; and a layer of soft rubber intervening between said shell and said injected material.

11. In a playing-ball, a shell having a plurality of layers of fabric compounded with celluloid, and distended by a core of gutta-percha injected therinto; and a layer of tensioned soft rubber intervening between said shell and said injected material.

12. In a playing-ball, a shell formed of a plurality of layers of plastic material and fabric, and distended by a core of plastic material injected therinto; and a layer of soft rubber intervening between said shell and said injected material.

13. In a playing-ball, a shell distended by a mass of mobile material injected therinto; said shell comprising layers of fabric and layers of fibrous material; and a layer of tensioned soft rubber intervening between said shell and said injected material.

701,786. GOLF-BALL. FRANK H. BERNARD, Hartford, Conn., assignor to The Kumpshall Manufacturing Company, a Corporation of New Jersey. Filed Mar. 24, 1922. Serial No. 99,092. (No model.)

Claim.—1. A playing-ball comprising a shell of gutta-percha, fabric and celluloid, said shell being distended by a mobile mass injected therinto.

2. In a playing-ball, a spherical shell consisting at least partially of gutta-percha and celluloid and distended by plastic material injected therinto.

3. In a playing-ball, a shell formed of gutta-percha, celluloid, and an intervening fabric layer; said shell being distended by a core of gutta-percha injected therinto.

4. In a playing-ball, a shell having an inner layer of gutta-percha and an outer layer of celluloid, and distended by a core of gutta-percha injected therinto.

5. In a playing-ball, a shell formed of a plurality of layers of different kinds of plastic material and distended by a core of plastic material injected therinto.

6. In a playing-ball, an embossed shell formed of gutta-percha and celluloid and distended by a gutta-percha core injected therinto; and a plug filling the injection-hole in the shell.

7. A playing-ball comprising a shell of cellulose or cellulose layers of gutta-percha and celluloid, said shell being distended by a core of plastic material injected therinto; and the outer of said layers being embossed.

8. In a playing-ball, a shell distended by a mass of mobile material injected therinto; said shell comprising a cellulose layer of gutta-percha isolated by a cellulose layer of fabric-lined celluloid.

9. A playing-ball comprising a shell of gutta-percha, fabric and celluloid, said shell being distended by a mobile mass injected therinto; and a layer of soft rubber intervening between said shell and said injected material.

10. In a playing-ball, a spherical shell consisting at least partially of gutta-percha and celluloid and distended by plastic material injected therinto; and a layer of tensioned soft rubber intervening between said shell and said injected material.

11. In a playing-ball, a shell formed of gutta-percha, celluloid, and an intervening fabric layer; said shell being distended by a core of gutta-percha injected therinto; and a layer of soft rubber intervening between said shell and said injected material.

12. In a playing-ball, a shell having an inner layer of gutta-percha and an outer layer of celluloid, and distended by a core of gutta-percha injected therinto; and a layer of tensioned soft rubber intervening between said shell and said injected material.

13. In a playing-ball, a shell formed of a plurality of layers of different kinds of plastic material and distended by a core of plastic material injected therinto; and a layer of soft rubber intervening between said shell and said injected material.

14. In a playing-ball, a shell distended by a mass of mobile material injected therinto; said shell comprising a cellulose layer of gutta-percha isolated by a cellulose layer of fabric-lined celluloid; and a layer of tensioned soft rubber intervening between said shell and said injected material.

701,787. VEHICLE-WHEEL. EDWARD BERNHARDT, Terre Haute, Ind. Filed Feb. 5, 1922. Serial No. 99,093. (No model.)

Claim.—1. A vehicle-wheel, consisting of a wooden body provided with a central enlargement having its ends lying substantially in planes perpendicular to its axis, metallic shells surrounding said body and provided with flanges fitting tightly against said enlargement, and lips on said flanges composed upon the outer surface of the enlargement.

2. In a vehicle-wheel, the combination with a wooden body provided with a central enlargement, of metallic shells surrounding the end portions of said body and having flanges fitting tightly against the ends of said enlargement, lips on said flanges comprising said enlargement.

radially, both clamping the flanges and subjugant together longitudinally, and splices having tapering stems-driven into said subjugant, the wood of the subjugant being thereby compressed and solidified both radially and longitudinally.

701,768. COTTON-CHOPPER. FRANK H. SHARP and LEWIS E. SHARP, Fort Dodge, Okla. Filed Aug. 6, 1901. Serial No. 71,000. (No model.)

Claim.—1. The improved cotton-chopper comprising a main frame, bent axle, and transporting-wheel, and a supplemental swinging frame which is pivoted to the main frame and adapted to swing in the direction of the travel of the machine, the means for suspension being here II arranged at front and rear as shown, a rotary shaft arranged longitudinally in the pendant frame and provided with a chopper, a horizontal shaft arranged in the front portion of the supplemental frame and geared with the chopper-shaft, a curved horizontal shaft supported in fixed bearings on the main frame, sprocket-gearing connecting the two horizontal shafts, means for imparting rotation to the upper horizontal shaft from one of the transporting-wheels, and lever mechanism for adjusting the swinging frame and connected parts forward or back and thus higher or lower without interrupting the operation of the chopper as shown and described.

2. The improved cotton-chopper, comprising the main frame transporting-wheel therefor, the supplemental frame comprising two pairs of bars pivoted to and pendant from each main frame, a rotary chopper carried in the supplemental frame, sprocket and bevel gearing connecting the chopper-shaft with one of the transporting-wheels, and a clutch, a rod and a hand-lever arranged as described, for throwing the chopper into and out of action, substantially as shown and described.

701,769. TALKING-MACHINE GAMING. HERMAN SUMNER, Philadelphia, Pa. Filed June 15, 1901. Serial No. 64,900. (No model.)

Claim.—The combination of the casing or inclosing structure, of the character described, a receptacle in the upper part of the case for a talking-machine, said receptacle having side supports for the base of said ma-

chine, receptacles arranged on either side of the talking-machine receptacle for the recording and reproducing needles and other parts of the machine, a compartment in the lower portion of the casing having a series of recesses or compartments for the records, said compartment adapted to swing outwardly to expose the records to view, a chamber or compartment to receive the base arranged between the talking-machine receptacle and the record-compartment, entrance to each chamber being at the side of the casing, and a door closing each entrance, said casing having an aperture registering with the winding-drum of the talking-machine when the latter is in place, such aperture being closed by the door of the base-compartment.

701,770. MACHINE FOR TREATING FLAX OR HEMP STRAW. JOHN T. SUMER, Haven Lake, Minn. Filed Sept. 7, 1900. Renewed June 17, 1901. Serial No. 64,900. (No model.)

Claim.—1. The combination, with a threshing-cylinder and concave, of a straw-rack wherein the material is delivered from said cylinder, a guide or feed board provided beneath the discharge end of said rack, a series of crushing-rolls provided near said straw-rack to receive the material from said feed-board, and a vertically-swinging carrier provided above said crushing-rolls and adapted to drop below the discharge end of said straw-rack and divert the material from said feed-board and crushing-rolls, substantially as described.

2. The combination, with a threshing-cylinder and concave, of a shaking straw-rack adapted to receive material therefrom, a removable feed-board provided beneath the discharge end of said straw-rack, crushing-rolls to receive the material from said feed-board, a vertically-swinging carrier provided above said crushing-rolls and adapted to drop below said straw-rack and divert the material from said feed-board and crushing-rolls, and a blast-fan arranged to receive the material from said crushing-rolls and from the discharge end of said carrier.

3. The combination, with a threshing-cylinder and concave, of a shaking straw-rack adapted to receive the material from said cylinder, a floor 40 beneath the lower end of said rack to receive the chaff and refuse material therefrom, a floor 44 beneath the upper portion of said rack and adapted to direct the material falling thereon to the receiving-floor 40, a hopper near the discharge end of said floor 40, a blast-fan communicating therewith, a series of crushing-rolls adapted to receive the straw from the discharge end of said rack and crush the woody portions and under-run said rolls, a perforated floor beneath said rollers adapted to discharge the fine material falling thereon into said hopper, a seed pan or plate beneath the perforated portion of said floor, and a conveyor to receive the seeds from said pan, substantially as described.

4. The combination, with a shaking straw-rack, of a feed-board be-

neath the discharge end of the same, a series of crushing-rolls provided near said feed-board and adapted to receive the straw from said rack and crush the woody portions and separate the fiber therefrom, a beater adapted to receive the material from said crushers, a perforated floor provided beneath said crushers and beater, a hopper adapted to receive the chaff and fine material falling upon said floor from said crushers, a blast-fan connected with said hopper, a seed-pan provided beneath the perforated portion of said floor, and a transverse conveyor adapted to receive the seeds from said pan.

5. The combination, with a threshing-cylinder and concave, of a straw-rack where the material is delivered from said cylinder a series of crushing-rolls provided near the discharge end of said rack to receive the straw therefrom, and a vertically-oscillating carrier provided above said crushing-rolls and adapted to drop its free end below the discharge end of said rack, whereby the material will be directed from said rolls, substantially as described.

6. The combination, with a straw-rack and feed-board provided beneath the discharge end of said rack, of a series of crushing-rolls adapted to receive the straw from said feed-board, and a vertically-oscillating carrier provided above said crushing-rolls and adapted to drop below the discharge end of said rack to divert the straw from said feed-board and said rolls, substantially as described.

7. The combination, with a shaking straw-rack, of floor whereon chaff and fine material are discharged from said rack, a hopper adapted to receive the chaff and waste material from said floor, a blast-fan connected with said hopper, a discharge-pipe through which the waste material is directed to the side of the machine, a feed-board provided beneath the discharge end of said rack, crushing-rolls to receive the straw from said board, and means provided beneath said crushing-rolls and adapted to receive the chaff therefrom and direct it to said hopper, substantially as described.

8. The combination, with a shaking straw-rack, of the floor provided beneath the same and adapted to receive the chaff and other waste material, a hopper beneath said rack and adapted to receive the chaff from said floor, a blast-fan connected with said hopper, a discharge-pipe extending laterally with respect to said hopper and fan and through which the waste material is directed to the side of the machine, a feed-board beneath the discharge end of said rack, crushing-rolls adapted to receive the straw from said feed-board, means provided beneath said crushing-rolls to receive the chaff and fine material therefrom and direct it to said hopper, means for receiving the seed separated from the straw by the action of the crushers, and a conveyor where the seed so separated is delivered, substantially as described.

9. The combination, with a shaking straw-rack, of a feed-board beneath the discharge end of the same, a series of crushing-rolls provided near said feed-board and adapted to receive the straw from said rack and crush the woody portions and separate the fiber therefrom, a perforated floor provided beneath said crushers, a hopper adapted to receive the chaff and fine material falling upon said floor from said crushers, a blast-fan connected with said hopper and a discharge-pipe through which the waste material falling into said hopper is directed to the side of the machine, substantially as described.

10. The combination, with a threshing-cylinder, of a straw-rack whereon the straw is delivered from said cylinder, floors provided beneath said rack to receive the chaff and other waste material, a transverse conveyor to receive the seeds from said floor, a repeat-elevator connected with said conveyor and adapted to return the seeds to said cylinder, a hopper provided near the discharge end of said floor to receive the chaff and waste material therefrom, a blast-fan connected with said hopper, a feed-board beneath the discharge end of said rack, crushing-rolls to receive the straw from said feed-board, and means provided beneath said rolls for receiving the chaff therefrom and delivering it to said hopper, substantially as described.

11. The combination, with a threshing-cylinder and concave, of a shaking straw-rack adapted to receive the material from said cylinder, a floor 40 beneath the lower end of said rack to receive the chaff and refuse material therefrom, a floor 44 beneath the upper portion of said rack and adapted to direct the material falling thereon to said floor 40, a hopper near the discharge end of said floor 40, a blast-fan communicating therewith, a series of crushing-rolls adapted to receive the straw from the discharge end of said rack to crush the woody portions and separate seed-balls and means provided beneath said crushers to receive the fine material falling therefrom and direct it into said hopper, substantially as described.

12. In a machine for treating flax and hemp straw, the combination with straw-shaking means, of a mechanism located beneath said shaking means to receive the chaff therefrom and deposit it at the side of the machine, crushing-rolls provided near said straw-shaking means, a feed-board near the discharge end of said shaking means to direct the straw therefrom to said rolls, and means provided beneath said rolls to direct

the chaff separated thereby to said chaff-receiving mechanism, substantially as described and for the purpose specified.

13. In a machine for treating flax and hemp straw, the combination with a shaking straw-rack, of means located beneath said rack to receive the chaff therefrom and convey it to one side of the machine, a feed-board beneath the discharge end of said rack, crushing-rolls near said feed-board to receive the straw therefrom, and a perforated floor provided beneath said crushers to receive the chaff and the seeds separated by the action thereof, and said conveyor being adapted to direct the chaff back to the chaff-receiving mechanism beneath said rack, while the seeds pass through said perforations, substantially as described.

14. In a machine for treating flax and hemp straw, the combination, with the threshing-cylinder, of a choker where the straw is delivered from said cylinder, means provided beneath said choker to receive the chaff and other waste material therefrom and direct it to the side of the machine, a transverse conveyor to receive the seeds separated by the action of said choker, a repeat-elevator connected with said conveyor and adapted to return the seeds to said cylinder, a feed-board provided beneath the discharge end of said rack, crushing-rolls to receive the straw from said board, and means provided beneath said rolls to receive the chaff therefrom and convey it back to the chaff-receiving means beneath said choker, substantially as described and for the purpose specified.

701,771. FREDERICK. RAMON R. BROWN, Newark, and JAMES H. RAM, Brooklyn, N. Y. Filed Oct. 25, 1899. Serial No. 24,695. (No model.)

Claim.—1. The U-shaped adjustable brace in combination with the flanged post, the said brace being pivotally secured thereto, and terminating in the curved neck, the same being threaded at its end and adjustably secured by the nuts to the flange of the post.

2. The combination with the U-shaped adjustable brace and centrally-flanged post, said brace being pivotally secured thereto, and terminating in the curved neck; of the tie-rod 5 threaded at its ends and having securing-nuts, and the angled U-shaped brace 6 all arranged and operating substantially as described and for the purpose set forth.

701,773. HOLLAND-REARER. JAMES STUART, Wilmington, Del., assignor to Lobell Car Wheel Company, Wilmington, Del., a Corporation of Delaware. Filed June 25, 1899. Serial No. 65,125. (No model.)

Claim.—1. The combination in a machine for pressing wheels, of a main casting forming an integral frame, a carriage for a mold, and a support.

part for the same carried by said frame, a lever pivoted to the frame and extending through an apertured portion of the main casing containing the same, a pressure-plate connected to the lever, a cylinder carried by the frame, and a piston in the cylinder connected to the lever with means for supplying fluid under pressure to the cylinder, substantially as described.

2. The combination of a frame having a table, a yielding support carried by said table, laterally-extending rails in line with said support, a carriage mounted on the rails and arranged to be moved onto the yielding support, and means for pressing the mold carried by the carriage, a portion of said carriage being over the table and constructed to engage a fixed portion of said table when pressure is applied to a mold, substantially as described.

3. The combination of a frame, a table, beams extending from said table, a carriage, wheels on said carriage arranged to travel on the beams, means for pressing the mold mounted on the frame, a cylinder under the table, a plunger in said cylinder, a frame carried by said plunger and arranged to support the wheels of the carriage, with means for supplying fluid to the cylinder, the fluid in said cylinder being under such pressure that during the process of pressing the mold the carriage will rest directly upon the table and relieve the wheels from pressure, substantially as described.

4. The combination of a frame, a table, beams extending on each side of the table, one or more carriages mounted on the beams, a cylinder pivoted to the frame, a lever also pivoted to the frame, a piston mounted within said cylinder and connected to the long arm of the lever, a pressure-plate hung from the short arm of said lever, means for admitting fluid under pressure to the cylinder, said carriages having portions placed to rest upon the table independently of the supporting-frame when the machine is operated, substantially as described.

5. The combination of a frame, a table, beams carried by said table and extending from each side thereof and forming rails, one or more carriages mounted on said rails and arranged to receive the mold to be pressed, a cylinder below the table, a plunger in said cylinder, a frame carried by said plunger and having flanges in line with the beams so that the carriage can be transferred from the beams onto the flanged frame, a lever pivoted to the upper end of the main frame of the machine, a pressure-plate connected to the lever and mounted directly above the table, and means for operating the lever, substantially as described.

6. The combination of a frame, a table, a carriage, a support therefor yieldingly mounted on the table, means on the frame for pressing the mold on said carriage, the latter having portions placed to rest upon the table whereby it is carried independently of the support when the pressing means is operated, substantially as described.

701,778. WATER-HEATING APPARATUS. RICHARD SCOTT, Windsor, England. Filed Jan. 10, 1908. Serial No. 64,882. (No model.)

Claim.—A water-heating apparatus comprising the boiler, and its fire-box, a hollow metallic water-chamber extending horizontally above the boiler in the path of the products of combustion, an offshoot or main flow-pipe leading from the boiler, a pipe connecting the said water-chamber with said main flow-pipe, a return flow-pipe leading to the boiler, a pipe connecting the said water-chamber with said return flow-pipe, a smoke-flue leading from the fire-box, a water-jacket surrounding the said flue, a pipe connecting said water-jacket with said main flow-pipe, and a second pipe connecting said water-jacket with said return flow-pipe; substantially as described.

701,774. MAIL-BAG GRABER. LEONARD E. GORDON, Boston, Mass., Ind. Filed Feb. 22, 1908. Serial No. 65,740. (No model.)

Claim.—1. In a mail-car, the combination of a standard, a mast mounted to rotate in said standard and bearing arms constructed to support a mail-bag, means for rotating said mast, means for holding said mast

against rotation, said last-mentioned means being constructed to be operated by a passing train to release said mast and permit it to rotate, and carry the mail-bag supported by said arms toward said train within reach of the catcher on the mail-car, substantially as described.

2. In a mail-car, the combination with a standard, of a mast rotatably mounted on said standard and bearing arms constructed to support a mail-bag, means for rotating said mast from a position with its arms extending nearly parallel to the track into a position with its arms extending at right angles to the track, means for holding said mast against a movement of rotation, said latter means being constructed to be operated by a passing train to release said mast and permit it to swing around with its arms at right angles to the track, substantially as described.

3. In a mail-car, the combination of a standard having a V-shaped slot therein, a mast mounted in said standard and bearing a pin engaging said slot, arms on said mast for supporting a mail-bag, means for holding said mast against a movement of rotation, said means being arranged to be operated by a passing train to release said mast, to permit said arms to swing toward the said train to bring said bag into position to be engaged by the arm on the mail-car, substantially as described.

4. In a mail-car, the combination with a standard having a V-shaped slot therein, of a mast rotatably mounted on said standard and bearing a pin engaging said slot, an elbow-lever, a belt pivoted to the short arm of said lever and arranged to engage an aperture in said mast to hold it against rotation, a trip engaging the long arm of said lever, said trip being located to be operated by a passing train to release said lever and said mast, and permit it to swing around to bring the bag within reach of the catcher-arm, substantially as described.

701,775. JACQUARD-CARD AND METHOD OF MAKING SAME. JAN SCHNEIDER, Vienna, Austria-Hungary, assignor to Société des Inventions Jan Schepers & Co., Vienna, Austria-Hungary. Filed Mar. 10, 1908. Serial No. 65,739. (Continued.)

Claim.—1. The process of making weaving cards or designs, which consists in coating a suitable metallic plate with an organic film, photographically copying a weaving-pattern on said film, developing the latter to expose parts of the metal plate, substantially as described.

2. The process of making weaving cards or designs, which consists in coating a suitable plate with an organic film, coating this film with one or more coats of a transparent substance, then applying a second organic film, providing said plate with a suitable photographic record developing the second organic film, then exposing the plate to light and developing the first organic film, substantially as described.

3. The process of making weaving cards or designs, which consists in copying a disposition through a suitable screen on a divided metallic plate coated with an organic substance, developing and hardening said organic coating, substantially as described.

4. The process of making weaving cards or designs, which consists in coating a suitable metallic plate with a slow organic film, coating the latter with a transparent film, and then applying a second and more rapid organic coating, providing said plate with a suitable photographic record developing the second organic film, exposing the plate to light and developing the first organic film so as to expose parts of the metallic plate, substantially as described.

5. The process of making weaving cards or designs, which consists

in coating a suitable plate with an artistic pigment film, coating the pigment film with one or more coats of a non-conductive transparent substance, then applying an artistic coating, exposing said plate to a photographic dispositive, developing the outer artistic film, then exposing the developed plate to light and developing the pigment layer, substantially as described.

6. The process of making waving cards or designs, which consists in coating a suitable metallic plate with a slow artistic pigment film, coating the latter with a transparent non-conductive film, and then coating the latter with a more rapid artistic film, exposing the plate under a suitable photographic dispositive, developing the outer film, exposing the plate to light and then developing the second artistic film, substantially as described.

7. The process of making waving cards or designs, which consists in coating a suitable metallic plate with a slow artistic pigment film, then with a suitable lac, and then with a more rapid artistic film exposing the plate to a photographic dispositive and a suitable screen, thereby dividing the photographic record as to indicate the stitches of a weaver's pattern, developing the outer film, exposing the developed plate to light, removing the lac and developing the under film to expose parts of the metallic plate, substantially as described.

8. The process of making waving cards or designs, which consists in copying a photographic dispositive through a suitable screen on sensitized paper, developing the print, rendering the paper transparent, copying the print on sensitized pigment paper, developing this print, transferring the pigment film from the paper to a suitable metallic plate and hardening said pigment film, substantially as described.

9. The method of producing waving pattern cards or designs, which consists in coating an electrically-conductive support with an artistic film, copying a photographic plate through a suitable screen on said film, developing and fixing the latter to produce a positive, treating the film with a suitable chemical to cause the picture to fade out and washing to remove the dark portions on said plate to produce a negative picture, substantially as described.

10. A card or design for jacquard-weaving, comprising a metallic plate provided with a finished photographic record to indicate a waving-crown, substantially as described.

11. A card or design for jacquard-weaving, comprising a divided metallic plate provided with a finished photographic record to indicate a waving-stitch, substantially as described.

12. A card or design for jacquard-weaving, consisting of a divided metallic plate with a finished photographic record thereon having electrically conducting and non-conducting parts arranged to indicate a waving-crown, substantially as described.

701,776. APPARATUS FOR MAKING HIGHT-CUTS FOR ICE-CREAM. ADOLPH VALUVA, Manchester, England. Filed July 12, 1901. Serial No. 60,902. (No model.)

Claim.—A combined mold and cover for producing blanch cups or dishes, consisting of two metal plates connected together by a hinge and provided with handles and means for opening said plates in closed position, the opening inner faces of the said plates being provided, one with a projecting rim and the other with an indented mold in the shape of such rim into which the one fits with a small space between the two, and the outer faces being so formed as to be adapted to rest on the top surface of a stove either side up so that heat may be evenly conducted through the body of the mold, all the heat absorbing and conducting films of the mold being of substantially the same thickness, whereby a cup may first be formed with the projections downward and afterward turned in the reverse position to facilitate the taking and allow the cup to be turned out of the mold, as and for the purposes described.

tion, the opening inner faces of the said plates being provided, one with a projecting rim and the other with an indented mold in the shape of such rim into which the one fits with a small space between the two, and the outer faces being so formed as to be adapted to rest on the top surface of a stove either side up so that heat may be evenly conducted through the body of the mold, all the heat absorbing and conducting films of the mold being of substantially the same thickness, whereby a cup may first be formed with the projections downward and afterward turned in the reverse position to facilitate the taking and allow the cup to be turned out of the mold, as and for the purposes described.

701,777. MEAN OR MEET FOR STRAIN-BULDER. SAMUEL M. VANLARK, Philadelphia, Pa., assignor to Burroughs, Williams & Company, Philadelphia, Pa., a Firm. Filed Jan. 2, 1901. Serial No. 60,100. (No model.)

Claim.—1. The combination of two plates to be joined together, with a cover-plate secured to the said plates by rivets arranged on lines diagonal to the line of fracture, substantially as described.

2. The combination of two plates to be joined together, with a cover-plate secured to the said plates by rivets arranged on lines diagonal to the line of fracture, the diagonal lines being such that the combined distance between the rivet-holes will be as great or greater than the width of the plates to be joined, substantially as described.

3. The combination of the two plates one abutting the other, a cover-plate, rivets securing the abutting plates to the cover-plate, said rivets being on lines diagonal to the line of fracture and forming a diamond, so that the combined distance between the rivets on each side of the joint will be greater than the width of the plate, substantially as described.

4. The combination of the two abutting plates, an outside cover-plate, an inside cover-plate in the form of a diamond with a row of rivets on each side of the joint, securing the cover plate and strip to the plates to be joined, and a diagonal row of rivets securing the inside cover-plate to the plates to be joined, substantially as described.

5. The combination of the two abutting plates, a cover-strip secured to each plate by a single row of rivets, a diamond-shaped plate also secured to the abutting plates by the said rivets, with a row of rivets securing the said plate to the abutting plates on diagonal lines, the outer rivets being further from the seam than the end rivets, so that the seam will be stronger than the plates secured together with the exception at the point where the outer rivets pass through the plate, substantially as described.

6. The combination of the abutting plates A, A, the cover-strip B, the inside cover-strip D in the form of a diamond, a row of rivets c securing the outer cover-strip and the inner cover-strip to the abutting plates, a row of rivets e arranged on an angle to the joint and adjacent to the edge of the diamond-shaped plate, substantially as described.

7. The combination of the abutting plates A, A, the cover-strip B, the inside cover-strip D in the form of a diamond, a row of rivets c securing the outer cover-strip and the inner cover-strip to the abutting plates, a row of rivets e arranged on an angle to the joint and adjacent to the edge of the diamond-shaped plate, with a series of rivets within the diamond securing the body of the diamond-shaped plate to the plates to be joined, substantially as described.

701,778. FERTILIZER-DISTRIBUTER. THOMAS J. WAGGONER, Philadelphia, Pa. Filed Oct. 12, 1901. Serial No. 70,002. (No model.)

Claim.—1. The combination with the scraper, of a flexible roller journaled across the rear end of the scraper, and star-wheels mounted on the journals of the roller to rotate it.

2. In a fertilizer-distributor, the combination with a suitable wheeled support, of a scraper adjustably and independently supported at each end, means to raise, lower, and tilt the scraper, a toothed roller journaled at the rear end of the scraper, and star-wheels on the journals thereof to turn the rollers.

3. In a fertilizer-distributor, the combination with a wheeled supporting-frame, of a scraper, a toothed roller journaled at the rear end of the scraper, star-wheels on the journals thereof, suspension-bars at the front end of the scraper, a lever to raise and lower the said bars, suspension-bars at the rear end of the scraper, and a lever to raise and lower the said bars.

701,779. PLANTER. JOHN E. WARDEN, Stephenville, Tex.
Filed Dec. 8, 1901. Serial No. 94,885. (No model.)

Claim.—1. In a seed-planter, the combination with a frame, of opposite supporting-wheels having journals, vertically-yieldable bearings carrying the journals and having opposite longitudinal slots, guide-pins carried by the frame and passed through the respective slots, and a seed-dropping hopper located between and carried by the wheels.

2. In a seed-planter, the combination with a frame, of opposite supporting-wheels having journals, vertically-movable bearings carrying the journals and provided with opposite longitudinal slots, one end of each bearing being provided with a laterally-projected stop-flange overlapping a portion of the frame to limit the movement of the bearing, and a seed-dropping hopper located between and carried by the wheels.

3. In a seed-planter, the combination of a frame having oppositely and rearwardly inclined handles, of vertically-angled guides carried by the handles and the sides of the frame, vertically-movable bearings mounted in the guides, wheels located within the frame and having journals mounted in the respective bearings, and a seed-dropping hopper carried by and rotatable with the wheels.

4. In a seed-planter, the combination with a frame, of upper and lower guide-loops carried by opposite sides of the frame, vertically-movable bearings mounted in the respective pairs of upper and lower guide-loops and provided at opposite ends with longitudinal slots, transverse pins entering the slots, a pair of supporting-wheels located within the frame and having journals which are mounted in the respective bearings, and a seed-dropping hopper carried by and rotatable with the wheels.

5. In a seed-planter, the combination with a frame, of handles inclined oppositely and rearwardly from the front portion of the frame, of guide-loops upon the handles and the respective sides of the frame, transverse pins extending across the loops, vertically-movable bearing-plates mounted in the respective pairs of upper and lower loops and having terminal bifurcations receiving the pins, the upper ends of the plates being provided with outwardly-directed stop-flanges overhanging the handles, a pair of supporting-wheels located within the frame and having journals mounted in the bearings, and a seed-dropping hopper carried by and rotatable with the wheels.

6. In a planter, the combination with a substantially rectangular frame, a draft connection at the forward end thereof, an opener located in rear of the draft connection, standards rising from the rear end of the frame, covers carried by the lower ends of the standards, handles extending upwardly and rearwardly from the front of the frame and connected to the tops of the standards, vertically-angled guide-loops carried by the handles and the sides of the frame, transverse pins extending across the loops, vertically-yieldable bearing-plates mounted in the guides and having opposite terminal bifurcations receiving the pins, the tops of the bearing-plates being provided with outwardly-directed flanges overhanging the handles to limit the downward movement of the bearing-plates, a pair of supporting-wheels located within the frame and provided with journals mounted in the respective bearing-plates, a seed-dropping cylinder carried by and rotatable with the wheels, said cylinder having its greater diameter at its center and also provided with discharge-openings at its point of greatest diameter, and a covering-coller mounted within the rear portion of the frame.

701,780. SHUTTLE MECHANISM FOR SEWING-MACHINE.
CHARLES T. WARDEN, San Antonio, Tex., assignor of one-half to George A. Houser, San Antonio, Tex. Filed Dec. 11, 1900. Serial No. 30,648. (No model.)

Claim.—1. The combination of the shuttle provided in its upper side near its nose with a cavity or recess and in its rear end with an upright groove, and the carrier forming a cradle for the shuttle and provided at its front end with a horizontal arm entering the recess or cavity in the nose of the shuttle and having at its rear end an upright rib entering the upright groove of the shuttle, substantially as set forth.

2. The combination of the shuttle provided at its rear end with an upright groove and the carrier therefor provided with an upright rib entering said groove and also provided with means engaging the nose end of the shuttle and adapted to cooperate with the rib and groove at the heel of the shuttle to prevent movement centrifugally of the shuttle against the recovery, and the recovery, substantially as described.

3. A shuttle-carrier, substantially as described, provided with a horn to lap upon and receive the nose end of the shuttle, and also provided with a rib to enter a groove in the heel end of the shuttle whereby to secure said shuttle and prevent its rolling and the shuttle formed for cooperation with said carrier, substantially as described.

4. A shuttle having on its outer side at its nose an offset providing a space between the shuttle and recovery in rear of said offset, and the tension-spring arranged in the space in rear of said offset and connected with the shuttle, and a carrier for said shuttle constructed to hold the shuttle from outward movement, substantially as set forth.

5. The combination of the shuttle open at its top and outer side whereby to expose the bobbin to view, and provided in its upper side near its nose with a cavity or recess for the nose of the carrier, and provided in its rear end with an upright groove, and the carrier having the horn extending horizontally over the nose of the carrier and entering the recess therein and provided with an upright rib entering the groove in the heel of the shuttle, the latter being constructed by the carrier at its side next the recovery and provided with the tension device on each side, substantially as described.

6. A shuttle provided at its rear end with an upright groove formed to receive the rib of the carrier and also provided within the lower portion of the upper side of its nose with a recess to receive the point of the horn of the carrier, combined with the carrier having an upright lip fitting the rear groove of the shuttle and the horn engaged in the recess thereof, substantially as set forth.

701,781. TRAIL-SWITCH. STEPHEN F. WARDEN, Philadelphia, Pa. Filed Dec. 10, 1901. Serial No. 94,886. (No model.)

Claim.—1. In a switch-operating device, the combination with the fixed and the movable members of a switch, of a lever pivoted to the fixed member and in engagement with the movable member, with mechanism to be carried by a car for engaging the lever and thereby operating the said movable member of the switch, said lever being placed relatively to the movable member so that it projects in the rear of the point of said member and is engaged by said mechanism after the latter has passed said point, substantially as described.

2. In a switch-operating device, the combination with the body of a switch having a movable member pivoted thereto, of a lever pivoted both to the body portion and to the movable member of the switch, and mechanism to be carried by a car for engaging said lever on one of its pivots, and thereby operating the movable member of the switch, said lever being placed so that it is engaged by said mechanism after the latter has passed the point of the movable member, substantially as described.

3. The combination of a switch, including portions of a main and a branch track, a movable member therefor constructed to guide the wheel of a vehicle into either of said tracks, a lever pivoted to the body of the switch having one of its ends in engagement with the said movable member

bar, and being placed so that the movable member projects beyond it at both ends, substantially as described.

4. The combination of a switch having a fixed and a movable member, a lever under the movable member in engagement with the same and pivoted to the fixed member, and a cam carrying a pivoted rod with means for bringing said rod to a level to contact with the lever to operate the movable member of the switch, said lever being placed on the switch so that the movable member extends beyond it at both ends, substantially as described.

5. The combination of a switch having a fixed and a movable member, a lever on the movable member in engagement with the same and pivoted to the fixed member, and a cam carrying a universally-movable rod, with means for normally retaining the rod in an elevated position, and means for depressing said rod at will to a level to contact with the lever, thereby operating the movable member of the switch, said lever being placed on the rear portion of the movable member, substantially as described.

6. The combination of a switch including portions of a main and of a branch track, a movable member to the switch, a lever pivoted to the body of said switch and engaging said movable member, so as to project in the rear of the point thereof, said lever being constructed to project to one side of the movable member toward the track for which said member is placed, a cam, and a device thereon provided with means whereby it may be caused to engage a projecting portion of said lever and thereby act the movable member of the switch for the other of the two tracks, substantially as described.

701,782. EXTENSION-TABLE. FRANKLIN WHITE, Landover, Md. assignor of one-half to Charles R. White, Landover, Md. Filed Feb. 28, 1902. Serial No. 95,735. (No model.)

Claim.—1. In an extension-table, the combination of a rigid frame having parallel grooved sides, a top formed in sections bearing guides mounted to slide in said grooves, and means for clamping said frame transversely of said sides to cause said sections against all movement, substantially as described.

2. In a table, the combination of a frame having parallel grooved sides, a top formed in sections bearing guides mounted to slide in said grooves, the rods extending transversely of said sides and bearing turn-buckles constructed to be operated to clamp said guides against all movement, substantially as described.

3. In a knockdown table, the combination of a frame having parallel grooved sides, a top bearing guides mounted to slide in said grooves, legs detachably connected to said sides and having transverse apertures therein, the rods passing through said transverse apertures in said legs and said sides, and turn-buckles engaging said rods and constructed to be

operated to clamp said guides against all movement and to cause said legs, substantially as described.

4. In a table, the combination of a frame having parallel grooved sides and ends loosely fitted into said sides, a top comprising sliding sections bearing parallel guides slidably mounted in said grooves, the distance between the faces of said guides being greater than the length of said ends between shoulders, the ends fitting apertures in said sides, and turn-buckles mounted on said rods, substantially as described.

701,788. TELEPHONE-CALL FOR PARTY-LINE. WILSON A. WILLIAMS, CHARLES L. LAMAR, and JOHN R. WILSON, Waltham, Wash. Filed Oct. 22, 1901. Serial No. 95,348. (No model.)

Claim.—1. In a selective call for party-line, the combination with a graduated switch-support, of a contact-switch adjustably mounted on the said support and arranged to be fixed upon the same in a position for each station peculiar to that station and differing from all other stations, a movable contact-making piece arranged to traverse said support and its switch, a step-by-step actuating mechanism for said movable contact piece, and an electric circuit with signal device located therein, said circuit being completed through the switch and contact-making piece, substantially as and for the purpose described.

2. In a selective call for party-line, the combination with a curved and graduated switch-support, of a contact-switch adjustably mounted on said support and arranged to be fixed therein in a position for each station, peculiar to that station and differing from all other stations, a movable contact-making lever arranged to traverse said curved support for the switch, a step-by-step actuating mechanism for said lever, and an electric circuit with signal device located therein, said circuit being completed through said switch and lever substantially as described.

3. In a selective call for party-line, the combination with a graduated switch-support, of a contact-switch consisting of a contact-tongue and a guard extending over the same and made longer than the tongue, and insulated therefrom, said contact-switch being adjustably mounted on said support and arranged to be fixed therein in a position peculiar to that station and differing from all other stations, a movable contact-making piece arranged to traverse said switch-support and its switch, a step-by-step actuating mechanism for said movable contact-piece, and an electric circuit with signal device therein, said circuit being completed through the switch and contact-making piece, substantially as described.

4. A selective call for party-line having the same construction for all stations and comprising a graduated support for a differentiating-switch, and a single differentiating-switch of the same construction for all stations but located on the switch-support at a point thereon peculiar to that one station and differing from all other stations substantially as set forth.

701,784. KITCHEN-CLAMP FOR FRAMING OR OTHER. JAMES F. ARNOLD, CHARLES L. ARNOLD, and CLAYTON R. ARNOLD, Springfield, Ohio. Filed Sept. 10, 1901. Serial No. 95,055. (No model.)

Claim.—1. A device of the character specified, the same consisting of a dog having a rectangular opening adapted to engage opposite sides of a cladding or joint, a handle to which said dog has a curved connection, and a locking-bar pivoted to said handle and adapted to engage with the cladding to lock the clamp in an operative position, substantially as specified.

2. In a clamp for laying siding or flooring, the combination of a handle, a dog adapted to engage with the sides of a cladding or joint, a curved connection between said dog and handle, the said handle being adapted to engage with the outer edge of the siding or flooring, which edge forms the fulcrum thereof in opening said handle to engage the dog with the cladding or joint, and a locking-bar having a pivotal connection with said handle and adapted to engage with the cladding or joint to hold the clamp in an operative position, substantially as specified.

701,785. RAILROAD-ENGINE. SYDNEY H. ARNOLD, Forester, Tex. assignor of two-thirds to L. A. Withers and Jessie Brown, Forester, Tex. Filed July 17, 1901. Serial No. 94,998. (No model.)

Claim.—1. In a hoisting-press, the combination with a hoisting-chamber, of a plunger extending therethrough, a power connected to and adapted to operate the plunger, and a coiled spring connecting the plunger and the hoisting-chamber, said spring being arranged to exert its tension during the outward movement of the plunger and retard such movement.

2. In a hoisting-press, the combination with a hoisting-chamber, of a plunger arranged therein, a power, means for connecting said plunger to said power, a cross-head upon the plunger and outside the hoisting-chamber, and springs connected to the ends of the cross-head and the hoisting-chamber for retarding the outward movement of the plunger from the chamber whereby the stroke of the plunger may be equalized.

701,786. PHOTOGRAPHIC-CAMERA. EDWIN D. BASHNET, South Tottenham, London, England. Filed Mar. 11, 1902. Serial No. 97,728. (No model.)

Claim.—1. In a camera, the combination with a camera-box, of a removable section mounted in said box, a film-carrier carried by said section, and a collapsible lens-carrier mounted in said box.

2. In a camera, the combination with a camera-box, of a removable section mounted in said box, a rotary film-carrier carried by said section, and a sliding lens-carrier mounted in said box.

3. In a camera, the combination with a camera-box, of a removable

section mounted in said box, a rotary film-carrier carried by said section, and a collapsible, sliding lens-carrier mounted in said box.

4. In a camera, the combination with a camera-box, of a removable section mounted in said box, a rotary film-carrier carried by said section, and a collapsible, sliding lens-carrier composed of telescoping portions mounted in said box.

5. In a camera, the combination with a camera-box, of a removable section mounted in said box, a rotary film-carrier carried by said section, a rotary film-carrier-opening device in the wall of said section, and a collapsible lens-carrier mounted in said camera-box.

6. In a photographic camera, the combination with a camera-box, of a removable section carrying the film-support mounted in said box, horizontal ribs on said section for supporting it within said box, and distance-pieces for maintaining said section in proper position.

7. In a photographic camera, the combination with a camera-box, of a removable section carrying the film-support mounted in said box, horizontal ribs on said section for supporting it within said box, and a film-receptacle beneath said removable section.

8. In a photographic camera, the combination with a camera-box, of a removable section carrying the film-support mounted in said box, horizontal ribs on said section for supporting it within said box, a film-receptacle beneath said removable section, and light-enclosing strips carried by said removable section.

9. In a photographic camera, the combination with a camera-box, of a removable section carrying the film-support mounted in said box, horizontal ribs on said section for supporting it within said box, a film-receptacle beneath said removable section, and spring-pressed light-enclosing strips carried by said removable section.

10. In a photographic camera, the combination with the camera-box, of a removable section carrying the film-support mounted within said box, horizontal ribs on said section for supporting it within said box, distance-pieces for maintaining it in proper position therein, and a rotary coupling device to form a connection between the film carrier or support and a turning-bar.

11. In a photographic camera, the combination with a camera-box, of a removable section carrying the film-support, horizontal ribs on said section for supporting it within said box, distance-pieces for maintaining it in proper position, a film-receptacle beneath said removable section, a rotary coupling device to form a connection between said film-carrier and a turning-bar, and a winding-reel carried by said removable section.

12. In a photographic camera, the combination of a camera-box, of a removable section mounted in said box, a film-support carried by said removable section, a film-receptacle, and sliding light-enclosing strips bridging the opening between said receptacle and said removable section.

13. In a photographic camera, the combination with a removable section, of a film-support mounted therein, and a spring-pressed film-receptacle beneath said removable section.

14. In a photographic camera, the combination of a film-support and a collapsible sliding lens-carrier.

15. In a photographic camera, the combination of a film-support, and a collapsible sliding lens-carrier composed of telescoping portions.

16. In a photographic camera, the combination of a film-support, a collapsible sliding lens-carrier comprising two relatively movable portions, means for maintaining the portions in an extended position, and means for moving the lens-carrier bodily in a retracted direction, substantially as set forth.

17. In a photographic camera, the combination of a film-support, a collapsible sliding lens-carrier comprising two relatively movable portions, steps upon each of the portions, a spring for operating the portions so as to maintain the steps in contact with one another, and a spring for moving the lens-carrier bodily in a retracted direction, substantially as set forth.

18. In a photographic camera, the combination of a film-support,

a collapsible sliding lens-carrier; and means for temporarily maintaining the said carrier in a collapsed condition, substantially as set forth.

19. In a photographic camera, the combination with a sliding lens-carrier, of means for moving said lens-carrier; and a cam device designed to temporarily delay the return movement of the carrier, substantially as set forth.

20. In a photographic camera, the combination with a sliding lens-carrier, of a locking device for maintaining the lens-carrier in one of its extreme positions, substantially as and for the purpose set forth.

21. In a photographic camera, the combination of a sliding lens-carrier, a retractable film-support for operating the carrier and a device for momentarily arresting the carrier in its return movement, substantially as and for the purpose set forth.

701,787. SHUTTER FOR CAMERA. JAMES BREWER, Essen, Germany, assignor to Fried. Krupp, Essen, Germany. Filed Feb. 2, 1901. Serial No. 92,276. (No model.)

Claim.—1. In combination with a gun having a tangent axis curved concentric to the trunnion, a front-sight carrier mounted independently of the tangent axis and rotatable about the axis of the trunnion, and an extension secured to a fixed part of the gun-mount in engagement with said front-sight carrier and holding it against rotation with the trunnion, so that the front sight maintains the same position for different elevations of the gun but is free to follow any lateral shifting of the trunnion in their bearings.

2. In combination with a gun having a tangent axis curved concentric to the trunnion, a front-sight carrier consisting of a ring, mounted in a groove in the trunnion independently of the tangent axis and rotatable about the axis of the trunnion; and an extension secured to a fixed part of the gun-mount in engagement with said front-sight carrier and holding it against rotation with the trunnion, so that the front sight maintains the same position for different elevations of the gun but is free to follow any shifting of the trunnion in their bearings.

3. In combination with a gun having a tangent axis curved concentric to the trunnion, a front-sight carrier consisting of a ring, mounted in a groove in the trunnion independently of the tangent axis and rotatable about the axis of the trunnion, and an extension secured to a fixed part of the gun-mount in engagement with said front-sight carrier and holding it against rotation with the trunnion, through the medium of a slide-block, on the end of said arm, and a slot in said carrier into which said slide-block enters, and has play, both vertically and parallel to the trunnion's axis, so that the front sight maintains the same position for different elevations of the gun but is free to follow any shifting of the trunnion in their bearing.

701,788. BINOCULAR MAGNIFYING-GLASS. BENJAMIN BROWN, Paris, France. Filed May 28, 1900. Serial No. 931,671. (No model.)

Claim.—A binocular optical glass for examining nearby objects, said glass having two prismatically-acting lenses inclined toward each other and arranged symmetrically with reference to the eye-axis of the user, to

transmit the visual rays to the two eyes in practically parallel lines, substantially as and for the purpose set forth.

701,789. CLOTHES-RACK. OWEN P. GALLAGHER, New York, N. Y. Filed Aug. 9, 1901. Serial No. 71,699. (No model.)

Claim.—1. In a clothes rack or drier, the combination with a base and a runner mounted to move vertically thereon; of means for raising and lowering the runner, a head-bracket mounted on said runner, a series of pivoted arms connected to said bracket, means for supporting said arms, said bracket comprising clamping members having notches to receive the inner ends of the pivoted arms, one of said head-bracket sections being provided with clamp-fingers and the other section provided with recesses to receive said fingers, and clamping means for holding the head-bracket sections together and securing the same to the runner.

2. In a clothes rack or drier, the combination with a base and a runner mounted to slide vertically thereon; of head and foot brackets mounted on said runner, arms pivotedly connected to the head-bracket, means for said arms having terminal hooks engaging openings in the foot-bracket, and stop projections on the outer side of the foot-bracket for preventing disengagement between the braces and foot-bracket.

3. In a clothes rack or drier, the combination with a base and a runner mounted to slide vertically thereon; of a bracket mounted on said runner a series of arms pivoted to said bracket and provided in their under side with sockets, a series of braces having pivotal connection with the runner and provided with stop-pins adapted to enter the sockets in the arms, and pivotal links interposed between said arms and the upper ends of the braces adjacent to the stop-pins, substantially as described.

701,790. SWITCH-OPERATING MECHANISM. FRED A. GARDNER, Penn Yan, N. Y. Filed Aug. 28, 1901. Serial No. 72,096. (No model.)

Claim.—1. In a switch-operating mechanism, the combination of a spring-actuated switch-point, a shifting bar connected therewith, a box or housing to receive said bar, a slide within said box, a tappet-pin projecting through a slot in the top of the box, and a lever connection between the shifting bar and slide as and for the purpose set forth.

2. In a switch-operating mechanism, the combination of a switch-point, means, on a spring, for holding said point in its normal position, a slotted plate between the main transverse to said switch, a slide beneath said plate, a pin connected with said slide projecting through the slot in said plate, and a yielding connection between said switch-point and said slide.

3. In a switch-operating mechanism, the combination of a switch-point, a shifting bar connected therewith, a box or housing to receive said bar, a slide within said box connected to said bar, a tappet-pin projecting through said slide and a slot in the top of the box, said pin projecting downward from said slide, a bar guided upon said slide and to which the tappet-pin is fastened, and springs on the ends to support said bar and allow for its depression.

701,791. AUTOMATIC CORRECTOR. RICHARD E. ANDERSON, Boston, Mass., assignor of one-half to Charles A. Hildreth, Boston, Mass. Filed Jan. 14, 1902. Serial No. 92,795. (No model.)

Claim.—The combination with the compression-link and handle; of the telescopic tubes *F* and *F'*, the former secured to the compression-link *A* and the latter secured to the handle, the screw-ping secured with the tube *F* at its upper end, the tubular shoulder formed integral with said screw-ping, the worm, the spiral formed integral therewith, and revolvably secured in the screw-ping located in the upper part of the tube *F*, a coil-spring surrounding the worm having its upper end secured to the tubular shoulder of the screw-ping, the nut to which the lower end of the coiled spring is secured, a channel formed through said nut corresponding to the form of the worm, and points located on the under side of the nut, substantially as described.

701,792. **WELL.** EDWARD E. ARTHUR, Ada, Okla., assignor of one-half to Ernest Oberlin, Ada, Okla. Filed Dec. 2, 1901. Serial No. 94,692. (No model.)

Claim.—1. In a drill, a stem, and a bit having interlocking portions provided with transversely-disposed aligned openings, and a key located within said openings, said key including a block having a journal-bearing, a wedge movable upon the block, and an actuating device journaled in the bearing of the block and being held against longitudinal movement therein, said actuating device having an engagement with the wedge to move it toward the journal upon the rotation of the actuating device.

2. In a drill, a stem, and a bit having interlocking portions provided with transversely-disposed aligned openings, and a key located within said openings, said key including a clamping-block having a journal-bearing, a wedge longitudinally movable upon the block, and a screw journaled in the bearing of the block and being held therein against longitudinal movement, said screw having a threaded engagement with the wedge to move it toward the journal upon the rotation of said screw.

3. In a drill, a stem, and a bit having interlocking portions provided with transversely-disposed openings, and a key located within said openings, said key comprising a pair of spaced blocks one of which is provided with an ear, a wedge movably located between the blocks to spread them apart, and an operating-screw journaled in the ear and held against longitudinal movement therein, said screw having a threaded engagement with the wedge, whereby upon its rotation said wedge will be moved.

4. In a drill, the combination with a stem and a bit having interlocking portions provided with transverse openings, the end walls of which are arranged out of alignment, of spaced clamping-blocks bearing against the opposite walls of the openings and having their inner walls arranged

in convergent relation, an ear secured to one of the blocks at their convergent ends, a wedge movable between the blocks, an operating-screw journaled in the ear and having its threaded end secured into the wedge, and a guard-plate fitted over the openings and covering the key.

5. In a drill, a stem and a bit having interlocking portions provided with aligned openings, and a key removably mounted in the openings and comprising spaced clamping-blocks having parallel outer faces and inner faces disposed in inclined relation, one of said blocks having an ear projecting from its inner face, a wedge mounted between and slidable longitudinally of the blocks, an operating-screw journaled in the ear and having a threaded engagement with the wedge, and a guard-plate threaded upon the stem and covering the openings and the key.

701,793. **FRISURE-CAGE.** EDWARD C. BROWN, Boston, Mass., assignor to Crosby Steam Cages & Valve Company, Boston, Mass., a Corporation of Massachusetts. Filed July 2, 1902. Serial No. 729,502. (No model.)

Claim.—In a pressure-gage the combination of a Bourdon tube-spring with an elongated water-chamber entirely within the curve of the spring; said water-chamber having located within it a tube isolated from the internal walls; the upper end of said tube communicating with the upper portion of said chamber, and the lower end of said tube being connected with the steam-passage of the gage; substantially as described.

701,794. **TELEPHONE SYSTEM.** CHARLES C. BROWN, Brooklyn, N. Y., assignor of one-half to John G. A. Whittemore, Boston, Mass. Filed Feb. 14, 1901. Serial No. 67,191. (No model.)

Claim.—1. In a telephone system the combination of local circuits and a line composed of a single ungrounded conductor, batteries and transmitters included in the local circuits, induction-coils having one terminal of the line-wire coils connected to the line conductor and their counter-wire coils included in the local circuits, and telephone-receivers connected up in the local circuits, as set forth.

2. In a telephone system the combination with a main line composed of a single ungrounded conductor, of local circuits, induction-coils having corresponding terminals of their line-wire coils connected to the line conductor, and their counter-wire coils included in the local circuits, and batteries and telephone-receivers connected up in the local circuits, as set forth.

3. In a telephone system, the combination with an ungrounded line conductor, of local circuits, induction-coils having corresponding terminals of their line-wire coils connected to the line conductor, and their counter-wire coils included in the local circuits, batteries and telephone-receivers connected up in the local circuits, supplemental induction-coils having their line-wire coils connected by corresponding terminals with the line-wire coils of the first-named induction-coils, and counter-wire coils in local

circuits, the free ends of the two-wire coils of the said two-wire induction-coils being connected with the corresponding ends of the three-wire coils of the supplemental induction-coils, and telephone-receivers in the local circuits of the three-wire coils of said supplemental induction-coils, as set forth.

701,795. MECHANISM FOR REMOVING ICE AND SNOW FROM THIRD-RAIL OR SIMILAR CONDUCTOR. EDWARD CHAMBERLIN and WALTER T. THOMPSON, Brooklyn, N. Y. Filed Apr. 3, 1901. Serial No. 54,124. (No model.)

Claim.—1. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of a pair of rotative members, one in advance of the other, supported from the truck of the car or the like and adapted to traverse said conductor, said members being provided with projections or the like for breaking up or crushing ice or snow deposited upon the conductor, the projections or the like on one member alternating with the spaces on the other, substantially as described.

2. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of a pair of rotative members, one in advance of the other, supported from the truck of the car or the like and adapted to traverse said conductor, said members being provided with projections or the like for breaking up or crushing ice or snow deposited upon the conductor, the projections or the like on one member alternating with the spaces on the other, and a brush in rear of said members for brushing the ice or snow from the conductor, substantially as described.

3. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of a pair of spring-pressed rotative members, one in advance of the other, supported from the truck of the car or the like and adapted to traverse said conductor, said members being provided with projections or the like for breaking up or crushing ice or snow deposited upon the conductor, the projections or the like on one member alternating with the spaces on the other, substantially as described.

4. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of a pair of spring-pressed rotative members, one in advance of the other, adjustably supported from the truck of the car or the like and adapted to traverse said conductor, said members being provided with projections or the like for breaking up or crushing ice or snow deposited upon the conductor, the projections or the like on one member alternating with the spaces on the other, substantially as described.

5. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of bracket 5 adjustably supported from the truck of the car or the like and adapted to traverse said conductor, and bearing a pair of rollers 6 each having rows of projections 14 for breaking up or crushing ice or snow deposited on the conductor, the rows of projections on one roller alternating with the spaces on the other, substantially as described.

6. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of spring-pressed bracket 5 adjustably supported from the truck of the car or the like and adapted to traverse said conductor, and bearing a pair of rollers 6 each having rows of projections 14 for breaking up or crushing ice or snow deposited on the conductor, the rows of projections on one roller alternating with the spaces on the other, substantially as described.

7. The combination with an electrically-propelled railway-car or the like provided with means for making electrical contact with a third-rail or similar conductor, of spring-pressed bracket 5 adjustably supported from the truck of the car or the like and adapted to traverse said conductor, and bearing a pair of rollers 6 each having rows of projections 14 for breaking up or crushing ice or snow deposited on the conductor, the rows of projections on one roller alternating with the spaces on the other, and brush 15 in rear of rollers 6, substantially as described.

701,796. AIR-BRAKE APPARATUS. WILLIAM L. CLARK, Col. wa, Iowa. Filed Dec. 20, 1900. Serial No. 57,348. (No model.)

Claim.—1. In a device of the character described, the combination with a section of hose provided at one end with a coupling-head adapted to be attached to a train air-pipe and provided at its other end with a cock, and means connected to said cock for opening the same and automatically releasable from said cock after it has been opened, substantially as set forth.

2. In a device of the character described, the combination with a section of hose provided at one end with a coupling-head adapted to be attached to a train air-pipe and provided at its other end with a cock, and means connected to said cock for opening the same and automatically releasable from said cock after it has been opened, said means comprising a cord having a ring at one end which engages the handle of the cock, and a spring for holding said ring in place when the cock is in closed position and for permitting the withdrawal of the ring from the handle of the cock after the cock has been opened, substantially as set forth.

3. In a device of the character described, the combination with a section of hose provided at one end with a coupling-head adapted to be attached to a train air-pipe provided at its other end with a cock, means for opening said cock, and a clamp for removably connecting the hose in the end of a car, said clamp comprising a bar having at its rear end a jaw and at its forward end an upwardly-bent portion, a screw engaging said upwardly-bent portion, a pronged head swivelled to the inner end of said screw, and a yokehead for embracing and holding said hose, substantially as set forth.

701,797. BOX AND FASTENER. OTTO G. SLAYTON, Chester, Pa., Ind. Filed Oct. 12, 1901. Serial No. 78,428. (No model.)

Claim.—1. The combination in a box, having its front provided with a horizontal slit, of ends having front flaps provided with vertical slots and extensions having their ends inserted into the vertical slots to form a cheath within the box, and a metallic fastener secured to the cover of the box to be inserted through said horizontal slit into the cheath to engage the lower edges thereof.

2. The combination in a folding box, the front of which is provided

with a horizontal slit, of ends having front flaps provided with overlapping extensions, and a metallic fastener secured to the cover of the box to be inserted through said slit between the extensions and having oppositely-disposed turned-up ends to engage under the lower edges and embrace the sides of said extensions.

701,798. FIREARM. WILLIAM F. O'NEIL, Waco, Tex. Filed June 13, 1901. Serial No. 64,577. (No model.)

Claim.—1. The combination with a breech-loading gun having an elliptical bore, of a rearwardly-extended guiding-surface corresponding with the bore substantially as shown and described for the purpose specified.

2. A gun having an elliptical and twisted bore and its breech extension provided with opposite parallel guide-surfaces whose inclination or twist corresponds with that of the bore, whereby a ball-cartridge is guided while being inserted in such manner as to insure coincidence of its transverse axis with that of the bore and its proper insertion into the bore, as specified.

3. A breech-loading magazine firearm having an elliptical twisted bore and its frame provided interiorly with opposite longitudinal guide-rails arranged in due alignment with the barrel and their inner sides inclined or twisted corresponding to the bore of the gun, substantially as shown and described.

701,799. DENTAL MATRIX. WILLIAM CHAMBERLAIN, Atlanta, Ga. Filed July 27, 1901. Serial No. 65,965. (No model.)

Claim.—1. A dental matrix comprising flexible members, means connecting and cooperating with the members to cause the respective member to extend entirely around the inner surface of the tooth against which it bears and approximating the contour thereof, and serving, also, to adjust said members to cause them to bear toward each other to facilitate withdrawal from the tooth substantially as described.

2. A dental matrix comprising flexible members, means connecting and cooperating with the members to cause the respective member to extend entirely around the inner surface of the tooth against which it bears and approximating the contour thereof, and serving, also, to adjust said members to cause them to bear toward each other to facilitate withdrawal from the tooth, additional means carried by the members for placing them under tension, and means operating between the members for effecting additional pressure of a member upon a contacting tooth, substantially as described.

3. A dental matrix comprising members of reverse curvilinear form, means connecting with the members and adapted to cause them to approximate the contour of the portion of the tooth against which each bears, means for effecting tensioning of said members, additional means for effecting separation thereof while tensioned, and means for effecting displacement of said members to cause them to bear toward each other to facilitate withdrawal from the tooth, substantially as described.

4. A dental matrix comprising flexible members, means connecting and cooperating with the members to cause them to approximate the contour of the portion of the tooth against which it bears, and to bear toward each other to facilitate withdrawal from between the teeth, and a strip or tongue for insertion between the members for effecting separation thereof while bearing against the teeth, substantially as described.

5. A dental matrix comprising flexible members carrying means serving to cause the respective members to extend around the inner surface of the tooth against which it bears and approximating the contour thereof, and serving, also, to adjust said members to cause them to bear toward each other to facilitate withdrawal from between the teeth, and means for varying the bearing-surface of said members for application to different-sized teeth, substantially as described.

6. A dental matrix comprising two flexible, oppositely-disposed members adapted to be placed between adjacent teeth, a support constituting a connection between said members and carrying means for effect-

ing adjustment of the members to cause them to approximate the contour of the inner surface of the tooth against which they bear to give the face of the filling therein the general outline of the tooth and serving also to adjust said members to cause them to bear toward each other and away from the filling to facilitate withdrawal therefrom, substantially as described.

7. A dental matrix comprising flexible members adapted to be placed between adjacent teeth and formed, at contiguous ends, with tube-pieces, a distance-adjusting device disposed between the tube-pieces, and means at the opposite ends of the members for adjusting them to approximate the contour of the tooth and, also, cause them to bear toward each other to facilitate withdrawal from between the teeth, substantially as described.

8. A dental matrix comprising members of reverse curvilinear form and provided at one end with a distance-piece, oppositely-threaded into secured at the free ends of said members, and an oppositely-threaded cover-rod adapted to engage said nuts to form an adjustable tension-bar for said members, substantially as described.

9. A dental matrix comprising members of a reverse curvilinear form and adapted to be placed between adjacent teeth, means carried by the outer ends of the members for effecting tensioning of the same, distance-pieces connecting with the inner ends of the members, one of said distance-pieces being replaceable, the parts being disposed and adapted to cause the members to bear toward each other to facilitate withdrawal from the teeth, substantially as described.

10. A dental matrix comprising members of reverse curvilinear form and adapted to be placed between adjacent teeth, means connecting with the members for tensioning them, said members being provided at contiguous ends with distance-pieces, and a strip or tongue having a pivotal connection with one of said pieces and adapted to extend between said members, substantially as described.

11. A dental matrix comprising flexible members adapted to be placed between adjacent teeth and formed, at contiguous ends, with tube-pieces, a distance-adjusting device, disposed between the tube-pieces, a pin adapted to engage the tube-pieces and distance-adjusting device to maintain them in relative position, and means engaging the remaining ends of said members for placing the same under tension, substantially as described.

701,800. FUEL-BURNER. CHARLES A. BALLY, Germantown, Pa., assignor of one-half to Nelson E. Whitaker, Wheeling, W. Va. Filed May 28, 1901. Serial No. 61,964. (No model.)

Claim.—1. A coal-dust burner for furnaces, comprising a hopper for holding the coal-dust; an air-chamber; a bladed gear-wheel mounted on a shaft running through said air-chamber; a perforated cup or shell loosely fitted in the base of said hopper; a gear-wheel secured to said cup to mesh with the bladed gear-wheel; a spiral bladed shaft connected to said cup or shell to extend into said hopper; means to rotate said shaft, and means for introducing air under pressure to the air-chamber, all arranged and combined to operate as set forth.

2. A combined oil and coal-dust burner for furnaces, comprising a burner-pipe, a hopper connected to said burner-pipe; an air-chamber connected to said pipe; a rotatable oil-spraying pipe extending through said air-chamber into said burner-pipe; a bladed gear-wheel mounted upon said rotatable pipe; a perforated cup or shell loosely fitted in the base of

said hopper; a gear-wheel secured to said cup to mesh with said oil-spraying pipe gear; a spiral bladed shaft connected to said cup or shell to extend into said hopper; means to rotate said oil-spraying pipe, and means for introducing air under pressure to the air-chamber, all arranged and combined to operate as shown and set forth.

701,801. RECOIL APPARATUS FOR ORDNANCE. KARL DIER-
LICH, Pilsen, Austria-Hungary, assignor to Steuderswerke Aottingen-
schmidt in Pilsen, Pilsen, Austria-Hungary, a firm. Filed Dec. 20, 1901.
Serial No. 87,200. (No model.)

Claim.—1. In an apparatus for returning a gun to its firing position, the combination with a top carriage provided with a slot in the top thereof, of a brake-cylinder mounted within and connected to one end of said carriage, a piston arranged in the cylinder, an inner tube surrounding the brake-cylinder, a spring interposed between said inner tube and said brake-cylinder and adapted to be compressed by said inner tube, an outer tube enclosing said inner tube, a spring interposed between the said inner and outer tubes and adapted to be compressed by said outer tube, connections between the outer tube and the gun, and connections between the outer tube and the piston, the compressing of the spring upon the inner tube being in advance of the compressing of the spring upon the cylinder during the action of firing.

2. In an apparatus for returning a gun to its normal position, the combination with a top carriage provided with a longitudinal slot, of a brake cylinder arranged within said carriage and connected to one end thereof, an inner tube enclosing said cylinder, a spring interposed between said inner tube and said cylinder and shutting a shoulder on the latter and adapted to be compressed by said inner tube, an outer tube enclosing said inner tube, a spring interposed between said inner and said outer tube and shutting against a shoulder on the inner tube and adapted to be compressed by the outer tube, and connections between said outer tube and the gun.

3. In an apparatus for returning a gun to its firing position, the combination with the top carriage provided with a longitudinally-extending slot in the top thereof, of a brake-cylinder mounted within and connected to one end of said carriage, a piston arranged in the cylinder, an inner tube surrounding the brake-cylinder and having at its forward end an internal shoulder and at its rear end an external shoulder, an annulus interposed between the rear end of the tube and said cylinder, a ring secured to the cylinder and arranged between the same and said annulus, a ring secured to said tube and interposed between the same and said ring *d*, a spring surrounding said cylinder and shutting against the internal shoulder of the inner tube and said annulus, an outer tube enclosing said inner tube and provided with an internal shoulder at its forward end, an annulus interposed between said outer and inner tube and shutting against the internal shoulder of the outer tube, a ring *p* secured to the

inner tube and arranged between the same and said outer tube, a spring mounted upon said inner tube and shutting against said annulus and external shoulder of the inner tube, connections between said outer tube and the gun, and connections between said outer tube and the piston.

701,802. SMOKELESS POWDER AND METHOD OF COMPOUNDING SAME. JAMES A. DUNTON and JAMES E. PERAZ, Johnson City, Tenn., assignors of one-third to HENRY C. KIRKPATRICK, Johnson City, Tenn. Filed Mar. 2, 1902. Serial No. 87,200. (No specimens.)

Claim.—1. A smokeless powder, consisting of chlorate of potash, wheat-flour and linseed-oil, prepared substantially as and in the proportions set forth.

2. The method of producing smokeless powder, which consists in grinding and mixing chlorate of potash and boiled linseed-oil with each other, incorporating therewith wheat-flour and water in sufficient quantities to obtain the mass in the consistency of bread-dough, thoroughly mixing these ingredients, drying the mass, and finally crushing or grinding the same to obtain the final product in a granulated condition.

701,808. COMBINED CLIP AND LAP-LINK. FREDERICK H. DE
ROOSCHER, Chattanooga, Tenn., assignor to Charles Morris, Chat-
tanooga, Tenn. Filed Oct. 20, 1901. Serial No. 38,987. (No model.)

Claim.—1. A combined clip and lap-link comprising a sleeve recessed on its inner surface and formed with openings, and headed overlapping hooks inserted through the said openings, the heads of said hooks resting in the recessed portion on the inner surface of the sleeve.

2. The combination with a vehicle single or double tree, of an attachment comprising a sleeve formed with openings and adapted to receive the single or double tree, and a pair of overlapping headed hooks recessed or flattened to form shoulders, said hooks loosely mounted in said openings and prevented from displacement by the said single or double tree.

3. A combined clip and lap-link comprising a sleeve recessed on the inner surface of its front wall and formed with openings in the said recessed portion adapted to receive overlapping headed hooks, the heads of said hooks fitting in the said recess and prevented from inward movement by the single or double tree inserted in the sleeve.

701,804. REVERSIBLE GALVANIC BATTERY. THOMAS A.
HARRIS, Libertyville Park, N. J., assignor to Edison Storage Battery Com-
pany, a Corporation of New Jersey. Original application filed Mar. 1,
1901, Serial No. 49,408. Divided and this application filed June 20,
1901. Serial No. 65,925. (No model.)

Claim.—1. An active element for a reversible galvanic battery, comprising a conducting-support, an electrolytically-active oxid of a specific magnetic metal other than iron carried by said support, and a flake-like inert conducting material intimately mixed with said oxid, substantially as set forth.

2. An active element for a reversible galvanic battery, comprising a conducting-support, an electrolytically-active oxid of a specific magnetic metal other than iron carried by said support, and flake-graphite intimately mixed with said oxid, substantially as set forth.

3. An active element for a reversible galvanic battery, comprising a conducting-support, an oxid of nickel carried thereby having more oxygen than Ni_2O_3 , and an inert flake-like conducting material intimately mixed with said oxid, substantially as set forth.

4. An active element for a reversible galvanic battery, comprising a conducting-support, an oxid of nickel carried thereby having more oxygen than Ni_2O_3 , and flake-graphite intimately mixed with said oxid, substantially as set forth.

5. An active element for a reversible galvanic battery, comprising a conducting-support, a hydrated oxid of nickel carried thereby, and a flake-like inert conducting material intimately mixed with said oxid, substantially as set forth.

6. An active element for a reversible galvanic battery, comprising a conducting-support, a hydrated oxid of nickel carried thereby, and flake-graphite intimately mixed with said oxid, substantially as set forth.

7. In a reversible galvanic battery, the combination of an electrolyte

which remains unchanged during all conditions of working, and two elements therein insoluble in each electrolyte, the depolarizing element having for its active material an electrolytically-active acid of a specific magnetic metal other than iron, substantially as set forth.

8. Is a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of working, and two elements therein insoluble in each electrolyte, the depolarizing element having for its active material an electrolytically-active acid of a specific magnetic metal other than iron and in a condition of oxidation higher than the peroxid state, substantially as set forth.

9. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support employing a receptacle having perforated walls, and a hydrated acid of a specific magnetic metal other than iron carried within said receptacle, substantially as set forth.

10. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, a hydrated acid of a specific magnetic metal other than iron carried by acid second support, and a flake-like inert conducting material intimately mixed with acid acid, substantially as set forth.

11. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, a hydrated acid of a specific magnetic metal other than iron carried by acid second support, and flake-graphite intimately mixed with acid acid, substantially as set forth.

12. Is a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of working, and two elements therein insoluble in each electrolyte, the depolarizing element having for its active material an electrolytically-active acid of nickel, substantially as set forth.

13. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, and an acid of nickel carried thereby having more oxygen than Ni_2O_3 , substantially as set forth.

14. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support employing a receptacle having perforated walls, and an acid of nickel carried within said receptacle and having more oxygen than Ni_2O_3 , substantially as set forth.

15. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, an acid of nickel carried thereby having more oxygen than Ni_2O_3 , and an inert conducting material intimately mixed with acid acid, substantially as set forth.

16. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting material, an acid of nickel carried thereby having more oxygen than Ni_2O_3 , and an inert flake-like conducting material intimately mixed with acid acid, substantially as set forth.

17. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, an acid of nickel carried thereby having more oxygen than Ni_2O_3 , and flake-graphite intimately mixed with acid acid, substantially as set forth.

18. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, a hydrated acid of nickel carried thereby, and a flake-like inert conducting material intimately mixed with acid acid, substantially as set forth.

19. Is a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by acid support, a second conducting-support, a hydrated acid of nickel carried thereby, and flake-graphite intimately mixed with acid acid, substantially as set forth.

701,805. SHOVEL. JOHN W. ELLER, Florence, Min. Filed Oct. 20, 1891. Serial No. 89,466. (No model.)

Claim.—A shovel comprising a blade having a forwardly-inclined integral socket at the center of the upper end thereof, said socket being hollow and internally screw-threaded at its upper terminal, a hollow handle with a lower externally-screw-threaded shouldered terminal to removably fit in the said socket, said handle being also provided with screw-threads at its opposite extremity, and a handhold having a central depending internally-screw-threaded socket to removably fit on the upper screw-threaded terminal of the handle, the said handhold being fashioned to adapt it for use as a tamper of substantially inverted triangular shape.

701,806. APPARATUS FOR GENERATING GAS. WILLIAM J. FARMER, Chicago, Ill. Filed Aug. 19, 1901. Serial No. 72,366. (No model.)

Claim.—1. In a gas-generating apparatus, the combination of a receptacle provided with a lining of refractory material, means for delivering into such receptacle molten material, means for introducing combustible fluid into the receptacle and directing such combustible fluid against the molten material, a series of depending generators extending below the surface of the molten material, and means to discharge gaseous fluid into the generators and to deliver gas from such generators; substantially as described.

2. In a gas-generating apparatus, a receptacle provided with a lining of refractory material and provided with an inlet for molten material, and molten material in such receptacle, in combination with a series of depending gas-generators open at the lower end thereof, respectively, each open end below the surface of the molten material, flues in the respective gas-generators, means for heating the molten material and the generators, and such gas-generators provided with outlets for gas; substantially as described.

3. In a gas-generating and superheating apparatus, a receptacle pro-

vided with a lining of refractory material, molten metal in the receptacle, and each receptacle, provided with an inlet for each molten metal, in combination with a series of depending gas-generators, provided, respectively, with inlets and outlets, a gas-discharge pipe common to all the generators, and provided with communicating passage-ways to the respective generators, and means to heat the molten metal and generators: substantially as described.

4. In a gas-generating apparatus, a receptacle provided with a lining of refractory material and provided with an inlet for molten metal, an inlet for combustible material and an outlet for the products of combustion, in combination with depending gas-generators, and gas-generators respectively extending to outside the receptacle, and feeders in the gas-generators, each feeder consisting of pipe respectively provided with apertures and additional pipes provided also with apertures, contained within the first-named pipes and each gas-generator provided, respectively, with outlets for the delivery of gas obtained therein: substantially as described.

5. In a gas-generating apparatus, a receptacle for molten material, molten material in such receptacle, a series of gas-generators partially immersed in such molten material, means for heating the molten material and the generators, means to deliver gaseous fluid into the generators a gas-pipe, each gas-pipe and the several gas-generators provided with communicating passage-ways, substantially as described.

6. In a gas-generating apparatus, a receptacle for molten material, molten material in such receptacle, a series of gas-generators partially immersed in such molten material, means to deliver gaseous fluid into the generators, and a gas-pipe, each gas-pipe and the several gas-generators provided with communicating passage-ways, and a partition in the apparatus, above the molten material, whereby a combustion-chamber is obtained, means to supply fuel to the combustion-chamber and each combustion-chamber provided with an inlet for air to support combustion and an outlet for the products of combustion: substantially as described.

7. In a gas-generating apparatus, a furnace, molten material in such furnace, a series of gas-generators, means to heat the molten material and the generators, means to deliver gaseous fluid into the generators, and a gas-pipe, each gas-pipe and the several gas-generators provided with communicating passage-ways: substantially as described.

701,807. RUBBER-THREAD WORKING. HARRISON C. FARR, Akron, Ohio, assignor to the Goodyear Tire and Rubber Company, Akron, Ohio. Filed Dec. 26, 1901. Serial No. 67,516. (No model.)

Claim.—1. An improved machine for working rubber having the heel portions highest, each recessed from below in an abrupt plane from the outside inward for a portion of its width, and thence by a curved line to the inner curve of the cushion, with the portion in front of said recesses decreased in thickness to the toe in a plane slightly curved upward from the end of said recess, substantially as shown and described.

2. An improved machine for working rubber having the heel portions highest, each recessed from below in an abrupt plane from the outside inward for a portion of its width, and thence by a curved line to the inner curve of the cushion, with the part in front of said recesses decreased in thickness to the toe in a plane slightly curved upward from the end of said recess, in combination with a metal plate of suitable outline to fit within said cushion and embedded and vulcanized therein, substantially as shown and described.

3. An improved machine for working rubber having thick and portions divided by abrupt planes from the intermediate part, in combination with an embedded metallic plate of like general outline but narrower, and having holes to permit the rubber to flow through and unite, in combination with a metal shoe adapted to rest on said rubber portion, with its ends abutting the abrupt ends of the highest parts, substantially as shown and described.

4. The herein-described machine consisting of a rubber section having thicker portions at the heel, divided by abrupt planes from the front portion, the front portion gradually decreased in thickness toward the toe, with a metallic plate having enlarged ends and smaller intermediate portion, and with holes for the rubber to flow through, embedded in said shoe, said parts being united by vulcanization, and a metal shoe to abut said heel portions of the rubber portion and bear on the intermediate part, and having holes to receive retaining-nails, substantially as shown and described.

701,808. SPINNING-SPINDLE. WILLIAM CROOK, Chicago, Ill. Filed Apr. 4, 1901. Serial No. 54,294. (No model.)

Claim.—1. The combination with a spindle, and a whirl, of a ball-bearing operatively engaging said spindle and having the cone member of said bearing slidably connected to the spindle to rotate therewith, and a cushion-spring engaging with said whirl and said cone member of the bearing.

2. The combination with a spindle, and a casing, of independent ball-bearings spaced relatively to one another on the spindle and each bearing having a cone member connected by a loose joint to said spindle for re-

turning thereon, and a cushion-spring interposed between said bearings, whereby the spindle may be partly forced outward by the compression of said spring.

3. In a spinning-spindle, the combination, with a casing, a spindle extending within the casing, and a whirl attached to the said spindle, of spring-controlled ball-bearings for the spindle, the cones of which bearings are attached to the spindle and have limited movement longitudinally of the spindle, and means, substantially as described, whereby one spring-cushion is located between opposing ball-bearings and a second spring-cushion is located between the whirl and adjacent ball-bearing, as set forth.

4. The combination with a casing, and a spindle, of separate bearing-cups arranged to have limited movement relative to one another, bearing-cones revoluble with the spindle and disposed in co-operative relation to said bearing-cups, suitable bearing-balls, and a cushion-spring disposed between and in operative relation to said bearing-cups.

5. The combination with a casing, and a spindle, of bearing-cups loosely held within said casing and slidably connected together for movement relative to one another, bearing-cones cooperating with said bearing-cups and connected to said spindle as to rotate therewith and to have a limited slidable play thereon, a cushion-spring tending to normally separate the bearing-cups and retain them in operative relation to the cones, and suitable bearing-balls.

701,809. SHAFT-DOOR AND STAIR LOCKING DEVICE. ADOLF GOTTKE, Wanne, Germany, assignor of one-half to H. Krenner, Wanne, Germany. Filed Mar. 21, 1902. Serial No. 100,900. (No model.)

Claim.—1. The combination with a shaft-door, or a part provided with slanting flaps, against which the arriving stage strikes to push back the part, a bolt, a lever engaging said bolt and provided with a nose, and means for positively connecting said lever with said shaft-door, so that on opening and closing said shaft-door said bolt is caused to lock and unlock respectively the stage, the said part being provided with a projection for engaging said nose of said lever to lock said shaft-door, when the part is released by the traveling stage, substantially as set forth.

2. The combination with a sliding shaft-door, of a part provided with slanting flaps, against which the arriving stage strikes to push back the part, a bolt, a shaft mounted to turn in suitable bearings, a lever affixed on said shaft and engaging said bolt and provided with a nose, a lever affixed on said shaft and pivotally connected with said shaft-door by a link, so that on withdrawing and closing said shaft-door said bolt is caused to lock and unlock respectively the stage, the said part being provided with a projection for engaging said nose of said bolt-lever to lock said shaft-door, when the part is released by the traveling stage, substantially as set forth.

701,810. FENCE CONSTRUCTION. JAMES J. HARR, Chatham, N. H. Filed Oct. 24, 1901. Serial No. 73,370. (No model.)

Claim.—The herein-described fence comprising a plurality of bar-sections 2; a plurality of rail-sections 4 and 5, in combination with fence-posts proper 1, means to secure said posts and said rail-sections in operative combination with each other; bracing-sections 7 crossing each other near their upper ends and fitting recesses in a contiguous part of the rail-sections; and a locking-pin fitting in registering apertures in said rail and bracing sections, all substantially as specified and for the purpose set forth.

701,811. HATCHES FOR JUMPING TYPE. FRANKLIN HARRIS, New York, N. Y., assignor, by mesne assignments, to John C. Burt and John Burt, New York, N. Y. Filed June 20, 1901. Serial No. 68,000. (No model.)

Claim.—1. The combination with the line-holder containing type in line, of a space-bar inserted therein crosswise of said type and projecting beyond the same; a device engaging with the projecting end of the space-bar for holding it, by means of said end, in the position to which it is advanced by the type-advancing mechanism and preventing it from moving backward.

2. The combination with the line-holder containing type in line, of a space-bar inserted therein crosswise of the type and projecting beyond the same; a movable stop attached to a suitable spring upon the side plate engaging with the projecting end of the space-bar for holding it, by means of such end, in the position to which it is advanced by the type-advancing mechanism and preventing it from moving backward.

3. The combination with the line-holder containing type in line, of a space-bar inserted therein crosswise of the type and projecting beyond the same; a movable stop attached to a suitable spring upon the side plate engaging with the projecting end of the space-bar for holding it, by means of such end, in the position to which it is advanced by the type-advancing mechanism and preventing it from moving backward; and means, substantially as described, for limiting the movement of the spring.

701,812. AUTOMATIC SICKER-DUMPING APPARATUS. THOMAS H. JONES, Grimsby, Ohio, assignor of one-half to Palmer C. Loveland, Grimsby, Ohio. Filed July 15, 1901. Serial No. 65,451. (No model.)

Claim.—1. In a bucket-dumping apparatus, the combination with a suitable supporting-frame, and a pulley mounted thereon, of an inclined guide-track mounted on the frame, a dumping device hinged at the upper extremity of said track and arranged to tip downwardly, a spring mounted on the frame, arranged to engage the bucket when mounted on the dumping device and adapted to collapse with the gravity of the bucket to perform the dumping function, means for normally holding the dumping

device in position to coincide with the position of the track, and a bucket-holding attachment mounted on the dumping device.

2. In a bucket-dumping apparatus, the combination with a suitable supporting-frame, and a sheave or pulley mounted on the upper portion thereof, of a bucket-guide track mounted on the frame in line with the pulley, a hinged dumping device normally forming a continuation of the track, means mounted on the dumping device for engaging and stopping the bucket when the latter has reached its limit of upward travel, said bucket-stop being arranged to support the bucket on the dumping device when the latter is tipped downwardly and the bucket inverted, and means mounted on the frame, arranged to engage the bucket when mounted on the dumping device and adapted to cooperate with the gravity of the bucket to perform the dumping function.

3. In a bucket-dumping apparatus, the combination with a suitable frame, a pulley mounted on the upper part of the frame, and arranged to be engaged by the bucket-cable, of an inclined track mounted on the frame, a hinged dumping device normally forming a continuation of the bucket-guide track, and a spring-held bucket-retaining device mounted on the dumping device, the arrangement being such that as the bucket is drawn up the inclined track, and loaded on the dumping device and the cable slackened, the gravity of the bucket tips the dumping device and throws the bucket to an inverted position.

4. In a bucket-dumping apparatus, the combination with a suitable supporting-frame located at the mouth of the shaft, a curved bucket-guide located in the upper part of the shaft, to cause the bucket to move easily out of the shaft to the bucket-dumping apparatus, an inclined guide-track mounted on the frame in alignment with the shaft-guide, a hinged or pivoted dumping device mounted on the frame in alignment with the bucket-guide, means for normally holding the dumping device in a position forming a continuation of the guide-track, and a yieldingly-retained bucket-holding device mounted on the dumping device.

5. In a bucket-dumping apparatus, the combination with a suitable supporting-frame, of an inclined guide-track mounted thereon, a hinged or pivoted device mounted on the frame in alignment with the guide-track, and a spring-retained hook mounted on the dumping device and adapted to engage the upper edge of the bucket and support the latter when in the inverted position.

6. In a bucket-dumping apparatus, the combination with a suitable supporting-frame, of a bucket-guide track mounted on the frame, a hinged or pivoted dumping device mounted on the frame in alignment with the bucket-guide track, a spring-held cross-head slidably mounted on the frame and provided with a hook adapted to engage the upper edge of the bucket as the latter is drawn upwardly to engagement with the dumping device, whereby the springs of the cross-head are placed under tension, and a leaf-spring mounted on the frame, arranged to engage the bucket when loaded on the dumping device, and arranged to cooperate with the gravity of the bucket to tip the dumping device downward, and weights applied to the dumping device and normally holding it in position to form a continuation of the bucket-guide track.

701,818. FLUID-PRESSURE PUMP. JAMES MCULLOCH, Perth, Scotland, assignor of one-half to George John Smith, Trellick, Kenwyn, Cornwall, England. Filed Feb. 28, 1899. Serial No. 48,548. (No model.)

Claim.—1. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, passages which respectively connect the ends of the valve-chamber directly with the opposite side of the working cylinder, a working piston of such length as to uncover one or other of said passages as it nears the end of each stroke, and passages respectively connecting the ends of the valve-chamber directly to an exhaust-opening common to both of said last-mentioned passages and adapted to be opened by said valve before completing its stroke, substantially as and for the purpose specified.

2. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, an exhaust-port having a central opening into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having recesses in its upper face to cooperate with said passages and central exhaust-opening, and means for preventing angular movement of the working piston, substantially as described.

3. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, an exhaust-port opening centrally into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having recesses adapted to cooperate with said passages and central exhaust-opening and passages respectively connecting the ends of the valve-chamber directly to exhaust and adapted to be opened by said valve before completing its stroke, substantially as described.

4. In a pump, the combination of the working cylinder, a guide-pin carried by the end cover of said cylinder, the piston-valve, the valve-chamber, an exhaust-port opening centrally into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, and a working piston provided with a guideway for said guide-pin and having recesses in its upper face to cooperate with said passages and central exhaust-opening, substantially as described.

5. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, an exhaust-port opening centrally into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having recesses in its upper face adapted to cooperate with said passages and central exhaust-opening, means for preventing angular movement of the working piston, and passages respectively connecting the ends of the valve-chamber directly to exhaust and adapted to be opened by said valve before completing its stroke, substantially as described.

6. In a pump, the combination of the working cylinder, a guide-pin carried by the end cover of said cylinder, the piston-valve, the valve-chamber, an exhaust-port opening centrally into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having a guideway for said guide-pin and provided with recesses in its upper face to cooperate with said passages and the central exhaust-opening, and passages respectively connecting the ends of the valve-chamber directly to exhaust and adapted to be opened by said valve before completing its stroke, substantially as described.

7. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, passages which respectively connect the ends of the valve-chamber directly with the opposite sides of the working cylinder, a working piston of such length as to uncover one or other of said passages as it nears the end of each stroke, passages respectively connecting the ends of the valve-chamber directly to exhaust and adapted to be opened by said valve before completing its stroke, a rod carried by the piston-valve, disks carried by said rod, and means carried by the pump-casing for cooperating with said disks to cushion the said valve, substantially as described.

8. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, an exhaust-port having a central opening into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having recesses to cooperate with said passages and central exhaust-opening, a rod carried by the piston-valve, disks carried by said rod, and means carried by the pump-casing for cooperating with said disks to cushion the said valve, substantially as described.

9. In a pump, the combination of the working cylinder, the piston-

valve, the valve-chamber, an exhaust-port having a central opening into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having recesses to cooperate with said passages and central exhaust-opening, a rod carried by the piston-valve, disks carried by said rod, a cylinder carried by the pump-rod and a central partition in said cylinder with which the said disks cooperate to cushion the valve, substantially as described.

10. In a pump, the combination of the working cylinder, the piston-valve, the valve-chamber, an exhaust-port having a central opening into the working cylinder, passages which respectively connect the ends of the valve-chamber with the working cylinder on opposite sides of the central exhaust-opening, a working piston having recesses to cooperate with said passages and central exhaust-opening, a rod carried by the piston-valve, disks carried by said rod, a cylinder carried by the pump-rod, a central partition in said cylinder with which the said disks cooperate to cushion the valve, and elastic substance interposed between the disks and the said central partition, substantially as described.

701,814. **ROLLER COTTON-GIN.** CHARLES J. McFERRON, South Framingham, Mass., assignor to the American Cotton Improvement Company, Phoenix, Ariz., a Corporation of Arizona. Filed Apr. 14, 1901. Serial No. 65,814. (No model.)

Claim.—1. In a cotton-gin, the combination of a rotary ginning-roll provided with a covering of hard fitted material, a stationary bed-knife fixed adjacent to each roll, and a rotary comb-roller consisting of a shaft, a series of toothed washers arranged on the shaft, and intermediate disks disposed between the toothed washers, the teeth on the washers being disposed in parallel spiral lines about the shaft, substantially as shown and described and for the purpose specified.

2. In a cotton-gin, the combination of a rotary ginning-roll provided with a covering of hard fitted material, a stationary bed-knife fixed adjacent to each roll, and a rotary comb-roller consisting of a shaft, a series of toothed washers arranged on the shaft, intermediate disks arranged on the shaft between the toothed washers, and nuts secured on the threaded ends of the shaft and operating to clamp the toothed washers and intermediate disks upon said shaft, the teeth of the washers projecting beyond the periphery of the disks and being disposed in parallel spiral lines about the shaft, substantially as described.

701,815. **AUTOMATIC FIREARM.** JULIUS A. H. RASMUSSEN, Copenhagen, Denmark, assignor to the Dansk Rakyl-Med. Syndikat, Copenhagen, Denmark. Filed June 16, 1900. Serial No. 739,600. (No model.)

Claim.—1. In the recoil-arm and machine-gun of small caliber in which after the discharge by the recoil of the barrel and lock the spent cartridge is automatically ejected and a recoil-spring contained in each a

manner that after the finish of the recoil movement the barrel and lock automatically return to normal position and the rifle is rendered fit for discharge again, the combination of a breech-bolt G of suitably-shaped grooves 74, 75, movable studs 80, 81 supported in the guide-frame, of a movable cartridge-feeder, guided in grooves 71, 72 of the guide-frame, of a sliding frame E with guide-plates 87 provided in connection with the tailpiece 87 of the lock-rod, of the recoil-rod 112 and main lever 111, the recoil-spring 113 and the mainspring 115, of an angle-lever 107 in connection with the rear arm of the trigger-rod with nose 100 and of a projection on the upper side of an arm 103 of the trigger-rod.

2. In firearms of the kind described the combination of a cartridge-feeder composed of three interconnected members 62, 64, 65 of a stud 66 on the lower member 62 and of guide-grooves 71 and 72 for stud 66 in the side part 5 of the guide-frame, substantially as described and shown.

3. In combination with the recoil parts of the arm, a recoil-arm to be operated by the recoil of the parts, a spring placed under tension and acting through said recoil-arm to move the parts forward, and trigger mechanism controlled by the said recoil-arm to hold the same inoperative until the parts are moved forward into closed position by the recoil-arm, substantially as described.

4. In combination in a firearm, the parts to be affected by the recoil, a hammer, a main lever for operating the same, a pivoted rod 103 for controlling the main lever, an angle-lever having an arm 107 for controlling the rod 103, a trigger carrying the angle-lever, a recoil-lever and a spring for placing the same under tension, said recoil-lever being arranged to control the angle-lever, to keep the same inoperative until the parts are returned to closed position by the recoil-arm, substantially as described.

5. In combination with the frame of the arm having a cartridge-ejection opening and a lid covering the same, said lid having a tongue projecting therefrom, a sliding lock-rod and a wedge projection thereon for operating the lid 19, substantially as described.

6. In combination, a pivoted cartridge-feeder having grooves therein, a sliding part to which the cartridge-feeder is pivoted, the pins 80, 81 adjustable toward and from the cartridge-feeder to engage and disengage the grooves thereof, said pins being carried by the frame of the arm and the connection between the pins whereby when one is moved in the other is moved out, substantially as described.

701,816. **SHOW-CASE.** AUGUST RINKEL, Baltimore, Md. Filed Oct. 10, 1901. Serial No. 46,307. (No model.)

Claim.—1. The improvement in show-cases herein described, consisting in the combination with the adjoining plates, of a joint-strip extending longitudinally between the edge of one plate and the face of the other plate and formed with the base-wing to rest upon the edge of one plate, the inner wing extending at approximately a right angle from the inner edge of the base-wing, the top wing extending outwardly from the

upper edge of the inner wing and corrugated longitudinally, the flange extending from the outer edge of the top wing past the outer edge of the base-plate and overlapping the outer face of the glass plate upon the edge of which the joint-strip is placed, the corner-plates upon the upper face of the corrugated plate, the covers engaging said corner-plates and the lag extending from the joint-strip along the inner face of the glass plate upon the edge of which the joint-strip is applied and provided with means for connection with said glass plate, substantially as and for the purposes set forth.

2. A show-case provided between the face of one plate and the edge of the shutter plate with an approximately U shape resilient cushioning-spring having one wing resting against the inner face of one plate and the other wing resting against the edge of the shutter plate, and both wings of the spring being arranged between the glass plate, substantially as set forth.

3. The combination with the adjoining glass plates arranged with the edge of one plate opposed to the inner face of the other plate, of the joint-strip having a base-plate resting upon the edge of one of the plates, an opposite plate overlying the base-plate and underlying the other glass plate and the flange projecting from the outer edge of said opposite plate past the base-plate and overlapping the outer face of the glass plate upon the edge of which the joint-strip is applied and means for covering the joint-strip in connection with the adjoining glass plates, substantially as set forth.

4. The combination with the adjoining glass plates, of the joint-strip extending between the same and having a base-wing, an inner upright wing, a top wing, and an outer wing extending past the outer edge of the base-wing, and overlapping the outer face of the glass plate upon which the base-wing is supported, substantially as set forth.

5. The combination with the adjoining glass plates, of the transversely-elastic joint-strip arranged between the same and extending in the direction of length of the joint, and provided at its outer side with a wing to overlap the outer face of the glass plate, the lag secured to the joint-strip at the inner side of the latter and means for securing said lag to the glass plate, substantially as set forth.

6. A joint-strip for show-cases having a base-plate and upright wing at the inner edge of the base-plate, a top-plate extending from the upper edge of the upright wing outwardly over the base-plate, and a flange projecting from the outer edge of the top plate past the free edge of the base-plate, substantially as set forth.

701,817. CURTAIN FOLD AND HANGER. HENRY P. BARNER, Boston, Mass., assignor to Albert S. Mitchell, Lexington, Mass., and William G. Jewett, Lancaster, Mass. Filed Aug. 17, 1906. Serial No. 27,186. (No model.)

Claim.—In a curtain-fold of the class described the spring-hanger comprising a single strand of wire bent centrally upon itself to form a loop and the ends of its arms then formed being coiled to form journals, *a*, in the same plane as said loop; and trunnions, *b*, mounted in said journals, the parts being so arranged that said trunnions in action run in sequence.

701,818. CURTAIN DISPLAY-RACK AND ADVERTISING DEVICE. GEORGE B. SWALL, Denver, Colo., assignor to the Matinee Curtain Company, Denver, Colo. Filed Oct. 12, 1901. Serial No. 73,104. (No model.)

Claim.—1. An improved article of manufacture, an advertising device comprising a cone-shaped base and a fan-shaped top suitably connected together, the top having its opposite inclined edges bent to form a support for an advertising-card, substantially as described.

2. As an improved article of manufacture, a device of the class de-

scribed comprising a cone-shaped base and a fan-shaped top suitably connected together, the opposite inclined edges of the top being fashioned to support an advertising-card, substantially as described.

3. As an improved article of manufacture, a device of the class described comprising a cone-shaped base and a fan-shaped top suitably connected together, the opposite inclined edges of the top being fashioned to support an advertising-card, and the upper edge of the top being provided with a lip or projection adapted to be turned down to hold the top of the card securely in place.

4. As an improved article of manufacture, a device of the class described comprising a cone-shaped base and a fan-shaped top suitably connected together, the opposite inclined edges of the top being fashioned to support an advertising-card, and the upper edge of the top being provided with a series of lips or projections adapted to hold packages, substantially as described.

5. As an improved article of manufacture, a combined display-rack and advertising device comprising a base tapering from the top toward the bottom where it is largest and of sufficient area to give the device a suitable support, and a fan-shaped top, one of the said parts having a threaded socket, and the other a counterpart projection adapted to enter the socket, whereby the two parts are connected, the opposite inclined edges of the fan-shaped part being fashioned to support an advertising-card, and its upper edge having lips or projections adapted to support packages or articles of merchandise, substantially as described.

701,819. EYEGLASS. FREDERICK A. STEVEN, Providence, R. I., assignor of one-half to Albert E. Lane, Providence, R. I. Filed Feb. 3, 1902. Serial No. 91,695. (No model.)

Claim.—1. In eyeglasses, the combination with a part of a closed box composed of a single piece affixed thereto, slots at the opposite sides of said box, a spring and a guard within the box, a washer intermediate the top wall of the box and the spring and guard, said washer having lateral ears longitudinally movable in said slots, and a threaded member traversing the washer, spring and guard.

2. In eyeglasses, the combination with a part of a closed box composed of a single piece affixed thereto, slots at the opposite sides of said box, a spring and a guard within the box, a washer intermediate the top wall of the box and the spring and guard longitudinally movable in said slots, and a screw-threaded member whose head is seated upon the washer traversing the washer, spring and guard.

3. In eyeglasses, the combination with a part of a closed box composed of a single piece affixed thereto, slots at the opposite sides of said box, a spring and guard within the box, a washer intermediate the top wall of the box and the spring and guard, said washer having lateral ears longitudinally movable in said slots and a binding-convex whose head is seated upon the washer traversing the washer, spring and guard.

4. As a new article of manufacture, a blank for an eyeglass-lens consisting of an oblong metallic strip, four transverse channels upon the lower face of the same, two of which channels lie within the other two channels and upon either side of the center of the strip, said slots adjacent the two inner channels to receive the edges of an inclined washer after the strip is folded.

5. As a new article of manufacture, a blank for an eyeglass-lens consisting of an oblong metallic strip, four transverse channels upon the lower face of the same, two of which channels lie within the other two channels and upon either side of the center of the strip, and rectangular slots

adjacent the two inner channels to receive the edges of an inclined washer after the strip is folded.

6. As a new article of manufacture, a blank for an eyeglass-lens consisting of an oblong metallic strip, transverse channels upon the lower face of the same, two of which channels lie nearer the center of the strip than the other channels, slots adjacent the two inner channels to receive the edges of an inclined washer, and openings in one end of the strip adapted to register when the strip is folded.

701,820. SEAL FOR TALKING-MACHINE RECORDS. LOUIS F. VALERIE, New York, N. Y. Filed Mar. 27, 1902. Serial No. 100,207. (No model.)

Claim.—1. A sound-record tablet having a central recess for centering the record on the reproducing apparatus, with a thin film of the material of which the tablet is formed extending across said recess.

2. A sound-record tablet having a central recess in its under surface for centering the record on the reproducing apparatus, with a thin film of the material of which the tablet is formed extending across said recess in line with the upper surface of the tablet.

3. A sound-record tablet having a central recess for centering the record on the reproducing apparatus, with a thin film of the material of which the tablet is formed extending across said recess, combined with a reproducing-machine having a rotating table and an upwardly-projecting pointed member adapted to enter said recess and pierce said film.

4. A sound-record tablet having a recess formed in it across which recess extends a thin film of the material of which the tablet is formed, combined with a reproducing-machine having a rigid projecting member adapted to enter said recess and pierce said film prior to the operation of reproduction.

701,821. MACHINE FOR SAND-FINISHING TOOL HOLDERS. ALFRED B. VOON, Omaha, Neb., assignor to Western Package Manufacturing Company, Omaha, Neb. Filed Sept. 27, 1901. Serial No. 73,780. (No model.)

Claim.—1. In a sand-finishing machine of the class described, a frame, pulleys on one side thereof near opposite ends and at different elevations, inclined endless bands connecting said pulleys, means to rotate the latter, a rock-arm, a shaft carried thereby, and having a work-holding element above said bands and disposed near the front end of the machine above the lower pulley, means to rotate said shaft, and means at the front end of the machine to raise and lower the front portion of said rock-arm, substantially as described.

2. In a sand-finishing machine of the class described, the combination with endless traveling sanding-bands and supporting-pulleys therefor, of a counterbalanced rock-arm, a shaft mounted thereon and having a

work-holding element above said sanding-bands, means to rotate said shaft and said work-holding element, and means to depress said rock-arm and lock the same in depressed position, substantially as described.

3. In a sand-finishing machine of the class described, the combination of a plurality of endless sanding-bands, means to rotate the same, a revolvable work-holding element adapted to be moved toward and from said sanding-bands, and means to independently tighten said sanding-bands, substantially as described.

4. In a sand-finishing machine of the class described, the combination of a power-shaft, a counter-shaft, in shiftable bearings, pulleys on said shafts, sanding-bands connecting said pulleys and means to tighten one of said sanding-bands independently of the other and a work-holding element adapted to be moved toward and from the sanding-bands, substantially as described.

5. In a sand-finishing machine of the class described, the combination of a power-shaft, a counter-shaft, in shiftable bearings, pulleys on said shafts, sanding-bands connecting said pulleys and yielding means bearing on one end of one of said sanding-bands, to tighten the same independently of the other, substantially as described.

701,822. HEATER AND DRYER. LOUIS B. VOON, Omaha, Neb., assignor to Western Package Manufacturing Company, Omaha, Neb. Filed Sept. 28, 1901. Serial No. 73,805. (No model.)

Claim.—1. A heater and drier of the class described, comprising a fire-box having a flue leading therefrom, and a heating and drying chamber over the fire-box, apertures in the sides of said chamber at one end thereof, and leading from the flue of the fire-box, and an escape-flue formed in the top of said chamber and extending longitudinally through the same, said apertures leading to said escape-flue, and doors at the ends of said chamber; in combination with an endless traveling carrier having one end disposed in and adapted to travel longitudinally through said heating and drying chamber, substantially as described.

2. In a heater and drier of the class described, the combination with a fire-box having a flue leading therefrom, of a heating and drying chamber having one end disposed over said fire-box, said heating and drying chamber comprising an inner and outer casing, the space between the sides of said casings forming non-collecting chambers, the said sides of said chamber having apertures formed therein at one end thereof and communicating with the flue of the fire-box, and the space between the said inner and outer casings on the top of the said heating and drying chamber forming an escape-flue which leads from the said apertures; a cross-chest over said fire-box and the flue leading therefrom and under said heating and drying chamber; and an endless carrier having one end adapted to travel through and disposed in said heating and drying chamber, over said cross-chest, substantially as described.

3. A heater and drier of the class described, comprising a heating and drying chamber having an escape-flue extending longitudinally above the same, apertures in the sides of said chamber and communicating with said escape-flue, a fire-box under said chamber and having a flue

leading to said uptake-flue, and a carrier extending through said chamber, substantially as described.

701,898. LIFTING-JACK. EMANUEL WOODMAN, Oakmont, Pa., assignor to Verona Tool Works, Oakmont, Pa., a Corporation of Pennsylvania. Filed Sept. 4, 1901. Serial No. 74,331. (No model.)

Claim.—1. A jack having a toothed bar, a plurality of pawls engaging the bar, and a weighted lever pivoted to the frame and arranged to act upon both pawls to reverse their movement; substantially as described.

2. A jack having a toothed bar, a plurality of pawls engaging the bar, a weighted lever pivoted to the frame and having portions arranged to act upon both pawls, and a latch device arranged to hold the weighted lever in inoperative position; substantially as described.

3. A lifting-jack having a toothed lifting-bar, an operating-lever having a pawl engaging the teeth of the bar, a depending pawl pivoted to the frame and also engaging the teeth of the bar, and a weighted lever pivoted at one side to the frame and having a cam-surface bearing upon the lower pawl, and an upper portion arranged to engage the upper pawl, in lowering the bar step by step; substantially as described.

REISSUES.

11,998. CONTINUOUS SHUFFLE-JURNACE. WILLIAM DUNN, Buxley, England, assignor, by mesne assignments, to the Glass Kilo Company, Limited, Buxley, England. Filed Jan. 31, 1902. Serial No. 90,608. Original No. 607,511, dated Apr. 17, 1899.

Claim.—The combination in a shuffle furnace or kiln for firing pottery-ware and enameled iron, with a continuous or endless circular shuffle-chamber having one opening where the goods to be fired are put in or taken out, of a turn-table or circular platform, means for revolving the turn-table from the outside of the furnace, a fire-brick, flame arranged in proximity thereto for conducting the flames and hot gases to a flue or flues along over and under the turn-table for a portion of the circuit and passing to a chimney without coming in contact with the goods being fired, all substantially as and for the purposes hereinbefore described.

DESIGNS.

85,928. PAPER. GEORGE W. BUNNELL, New York, N. Y. Filed Aug. 8, 1901. Serial No. 71,418. Term of patent 7 years.

Claim.—The design for paper as herein shown and described.

85,929. SPOON. SAMUEL J. LARSEN, Bristol, Conn., assignor to American Silver Company, Bristol, Conn. Filed May 14, 1902. Serial No. 100,545. Term of patent 7 years.

Claim.—The design for a spoon as herein shown and described.

85,980. KIP-STRAP HOOK FOR HARRIS. ALBERT HERRA, Lincoln, Neb. Filed Mar. 24, 1902. Serial No. 95,517. Term of patent 7 years.

Claim.—The design for a kip-strap hook as herein shown and described.

85,981. RECOVERED-PAGE. CHARLES W. REHMAN, Brooklyn, and JAMES F. REHMAN, New York, N. Y. Filed Apr. 11, 1902. Serial No. 100,426. Term of patent 14 years.

Claim.—The design for a recovered-page, as herein shown and described.

85,983. STOVE OR RANGE. THOMAS S. KENNEDY and EDWARD J. KING, Rochester, N. Y., assignors to Co-operative Foundry Company, Rochester, N. Y., a Corporation of New York. Filed May 12, 1902. Serial No. 107,048. Term of patent 7 years.

Claim.—The design for a stove substantially as herein shown and described.

85,988. BEDSTEAD. MARTIN V. HAMMACK, Thibault, Va., assignor of one-half to Cephus G. Grimes, Portsmouth, Va. Filed Mar. 20, 1902. Serial No. 100,657. Term of patent 7 years.

Claim.—The design for a bedstead substantially as herein shown and described.

85,984. RUG. EDWARD H. BROWLEY, East Orange, N. J., assignor to John H. Browley and Edward Browley, copartners trading as John Browley & Son, Philadelphia, Pa. Filed Apr. 20, 1902. Serial No. 100,600. Term of patent 3 1/2 years.

Claim.—The design for a rug substantially as shown and described.

TRADE-MARKS

REGISTERED JUNE 8, 1902.

88,873. DOLLS. THE SEYMOUR & WILSON Co., New York, N. Y. Filed Apr. 20, 1902.

AMERICAN BEAUTY

The words "AMERICAN BEAUTY." Used since 1895.

88,874. GAME-BOARDS. EDWARD HENNING, Chicago, Ill. Filed Apr. 16, 1902.

THE OWL

The words "THE OWL" and the picture of an owl represented as sitting on a perch. Used since August 15, 1901.

88,875. COTTON THREADS. NEW ENGLAND COTTON YARN COMPANY, Jersey City, N. J., and New Bedford, Mass. Filed Nov. 22, 1901.

The word "FEDERAL" and a circle inclosing the same. Used since June 1, 1901.

88,876. PRINTED COTTON THREADS. THE BOSTONIAN CO., Philadelphia, Pa. Filed Apr. 23, 1902.

The representation of the figure of three women in the dress of ancient Greece standing beside a microscope in an attitude of observing. Used since January 1, 1902.

88,877. SILK FINE GOWN, SILK RIBBON, AND SILK GARNER. THE VALLEY & BUCKLEY CO. Co., Boston, N. J. Filed Apr. 8, 1902.

The representation of two hands printed in black and in the act of exerting a tearing strain on a piece of woven silk fabric. Used since March 30, 1902.

88,878. LADIES' GLOVES AND SUITS. S. ROBINSON & SON, New York, N. Y. Filed Oct. 7, 1901.

The representation of a crown. Used since 1875.

88,879. HOME SEWING, JERSEY GLOVES, HITTERS AND CAPS. STRAND-CASE KNITTING CO., Chicago, Ill. Filed Apr. 2, 1902.

Colonial

The word "Colonial." Used since May, 1901.

88,880. PORTWINE. BAKER & BAKER, New York, N. Y. Filed Apr. 12, 1902.

D. R. Baker

The stylized signature "D. R. BAKER." Used since April, 1901.

JUNE 3, 1902.

U. S. PATENT OFFICE.

2515

88,881. WHISKY AND COGNAC. CHARLES E. HENNING & Co., Boston, Mass. Filed Jan. 15, 1902.

Th. Jefferson

The portrait of the deceased statesman and President, Thomas Jefferson, and also his facsimile signature, "TH. JEFFERSON." Used since December 24, 1901.

88,882. GLOVES. BERRY BROTHERS' SHOE COMPANY, Lynn, Mass. Filed Dec. 26, 1901.

The word "GLORIS," associated with the representation of a crown surmounted by the heraldic figure of a bird. Used since April, 1901.

88,883. WINDMILL DRAWN.

88,884. CERTAIN NAMED DRINK. Wm. Jay Greenleaf, New York, N. Y. Filed Feb. 15, 1902.

LAMINOID

The word "LAMINOID." Used since February 4, 1902.

88,885. MEDICAL COMPOUND FOR TREATMENT OF GONORRHOEA. LAYMOND D. BLANCH, Maple Heights, Mich. Filed Mar. 22, 1902.

The representation of a date and pencil. Used since March 6, 1902.

88,886. MEDICAL PREPARATION MADE FROM BARK. C. FARMER MEDICAL COMPANY, New York, N. Y. Filed Mar. 5, 1902.

VITALONGA

The word "VITALONGA." Used since December 15, 1900.

88,887. REMEDY FOR FEVERISH DISORDERS. JAMES WARD, Nottingham, England. Filed Apr. 24, 1902.

FEBRISUM

The word "FEBRISUM." Used since April, 1901.

88,888. REMEDY FOR CERTAIN NAMED DISEASES. JAMES WARD, Nottingham, England. Filed Mar. 31, 1902.

The word "CURMATION" hyphenated into the syllables "CUR-MA-TION" and arranged upon a shield. Used since February 4, 1902.

88,889. REMEDY FOR CERTAIN NAMED DISEASES. ALBERT T. WARDMAN, Algon, La. Filed Apr. 17, 1902.

COAL-ROLLER

The hyphenated word "COAL-ROLLER" and the representation of a man rolling a wheelbarrow filled with coal. Used since January, 1902.

88,890. REMEDY FOR CERTAIN NERVOUS DISEASES. WILLIAM BOWEN JR., London, England. Filed Nov. 15, 1901.

REMEDIATIVE

The word "REMEDIATIVE." Used since April 15, 1901.

88,891. LINIMENT. ALBERT C. CARLSON, Plymouth, Pa. Filed Mar. 16, 1902.

The representation of the figure of a man engaged in the art of spearing a snake. Used since January, 1902.

88,892. SALVE OR OINTMENT. RICHARD F. HARR, Jackson, Va. Filed Apr. 26, 1902.

BRESTORIA

The word "BRESTORIA." Used since March 1, 1902.

88,893. ALK. McCORMACK HERVEY Co., Charleston, W. Va., and Boston, Mass. Filed Apr. 17, 1902.

TRIUNE

The word "TRIUNE." Used since June 1, 1901.

88,894. COFFEY. THE ARLO-AMERICAN DISTILLERS TRADING CO., Ltd., Glasgow, Scotland. Filed Apr. 24, 1902.

The word "COFFY" and the picture of a coat drawn by a man. Used since November, 1901.

88,895. CERTAIN NERVOUS FORMS AND RELIEFING. DONALD BRADY JR., St. Louis, Mo. Filed Mar. 11, 1902.

The word "CUPID" and the representation of a winged cupid. Used since October 30, 1901.

88,896. CERTAIN NERVOUS PACKING-HOUSE PRODUCTS. SWIFT AND COMPANY, Chicago, Ill. Filed May 2, 1902.

EL VOLCAN

The word "EL VOLCAN." Used since April 15, 1900.

88,897. CERTAIN NERVOUS PACKING-HOUSE PRODUCTS. SWIFT AND COMPANY, Chicago, Ill. Filed May 2, 1902.

LA REMEDIANA

The word "LA REMEDIANA." Used since April 15, 1900.

88,898. CERTAIN NERVOUS PACKING-HOUSE PRODUCTS. SWIFT AND COMPANY, Chicago, Ill. Filed May 2, 1902.

LA GITANA

The word "LA GITANA." Used since January 1, 1902.

88,899. CERTAIN NERVOUS PACKING-HOUSE PRODUCTS. SWIFT AND COMPANY, Chicago, Ill. Filed May 2, 1902.

LA ORIENTAL

The word "LA ORIENTAL." Used since October 15, 1901.

88,400. STONE-FOOD. JOHN W. PETT, Winston, N. C. Filed Mar. 10, 1902.

LICK

The word "LICK" and the representation of a deer and buffalo standing facing each other, heads bent down, noses near the ground. Used since January 1, 1902.

88,401. CUFFING-BATHS AND CUFFING-GLASSES. EUREKA BATH-TUB CO., Chicago, Ill. Filed Apr. 15, 1902.

EUREKA

The word "EUREKA." Used since May 1, 1902.

88,402. MATCHES. CHARLES WILLIAMS, Philadelphia, Pa. Filed Feb. 10, 1902.

Arc Light

The word "ARC LIGHT" with the representation of an arc-lamp. Used since January 25, 1902.

88,403. SOAP. BRADSHAW SOAP CO., Highland, Ky. Filed Nov. 7, 1901.

THE ONLY SOAP MENTIONED IN SCRIPTURE

The word "THE ONLY SOAP MENTIONED IN SCRIPTURE." Used since July 1, 1901.

88,404. METAL LACQUER. NEW ERA LACQUER COMPANY, New Haven, Conn. Filed Apr. 20, 1902.

NEW ERA

The word "NEW ERA." Used since March 29, 1902.

88,405. BRUSHING AND POLISH. CIRCLE MANUFACTURING CO., Norwich, Mass. Filed Jan. 22, 1901.

CIRCLE

The word "CIRCLE." Used since June 20, 1900.

88,406. APPURTENANCES FOR THE CARE OF SHOES AND BOOTS. E. C. BARN & CO., Boston and Waltham, Mass. Filed Apr. 24, 1902.

Regal

The word "REGAL." Used since January 1, 1900.

88,407. BEAUTY. ALBERT H. HARR, Jackson, Va. Filed Apr. 2, 1902.

AMERICAN BEAUTY

The word "AMERICAN BEAUTY." Used since February 25, 1902.

88,408. LAMP-GLASS. FRANKLIN & CO., New York, N. Y. Filed Apr. 16, 1902.

The word "INDIFFERENT" within a rectangular frame, the full figure of a lion in standing position, and an oval including the letters and character "F & O." Used since September, 1901.

88,409. TOY WAGONS AND SIMILAR TOY VEHICLES. GARDNER TOY COMPANY, Chicago, Ill. Filed Apr. 15, 1902.

IRON CLAD

The word "IRON CLAD." Used since July, 1904.

88,410. SEAL-WIRE AND SOFT-METAL SEAL. KATYON SEAL & FINE COMPANY, New York, N. Y. Filed Apr. 20, 1902.

ANTI-STRIP

DECISIONS

OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS

ASENCIO S. RUSSELL.

Decided May 1, 1900.

BURDEN OF PROOF—RENEWAL OF FORFEITED CASE—APPLICANT AGAINST PATENTEE.

Where an application is allowed and becomes forfeited through a failure to pay the final fee within six months and during the time that it is forfeited an application is filed by another party covering the same invention and a patent is granted thereon, *Held* that in an interference between the patent and a renewal of the first application the burden of proof is upon the applicant notwithstanding the earlier date of his first application.

APPEAL ON MOTION.

FULFILLMENT.

Patent to Thomas Asencio granted October 2, 1900, No. 689,300. Renewal application of William M. Russell October 16, 1900, No. 83,313.

Messrs. Brown & Seward for Asencio.

Mr. T. P. Bourne for Russell.

ALLEN, Commissioner:

This is an appeal by Asencio from a decision of the Primary Examiner denying his motion to shift the burden of proof in the above-entitled interference.

It appears from the record that Russell filed an application July 22, 1897, which was allowed October 25, 1898, and became forfeited for non-payment of the final fee. On April 27, 1900, Asencio filed an application, which was allowed June 30, 1900, containing a claim which covers the subject-matter of the issue of this interference. This application became a patent October 2, 1900. On October 16, 1900, Russell's application was renewed, and an amendment containing the claim of Asencio's patent and descriptive matter relating thereto was filed therein October 19, 1900. In due course this claim was allowed and an interference declared between the application and the patent to Asencio. In the declaration of this interference Russell was made the senior party by virtue of the earlier filing date of his original application, whereby the burden of proof was placed upon Asencio. Asencio then brought the present motion to shift the burden of proof.

It is well settled that an application for the same invention filed in place of one which has become forfeited for non-payment of the final fee will under some circumstances relate back to and take the

99 O G—10—11

benefit of the filing date of the original application. (*Thomson v. Waterhouse*, 30 O. G., 177.) Thus under proper circumstances the inventor may become entitled to the original or forfeited application as a constructive reduction to practice. (*Christensen v. Noyes*, 90 O. G., 232.) In an interference in which both parties are applicants, therefore, it may happen that one may have the advantage of his earlier forfeited case to show constructive reduction to practice, so that the burden of proof will be thrown upon his opponent.

In the case now under consideration when Asencio filed an application and obtained a patent there was no conflicting application pending before the Office nor any unexpired patent with which it would interfere. His patent therefore was regularly and lawfully issued. In such a case the rule in regard to the burden of proof does not apply. (*Christensen v. Noyes*, 90 O. G., 237.) In this case the Court of Appeals of the District of Columbia said:

A subsisting patent lawfully issued, cannot be invalidated or in any manner affected by any subsequent proceeding in the Patent Office, even to the extent of imposing the burden of proof upon its holder that it was lawfully issued.

The decision of the Examiner denying the motion to shift the burden of proof is reversed.

EX PARTE BRILL.

Decided May 15, 1900.

DIVISION—RAILROAD-CARS—LOOKS FOR WINDOWS IN SAME.

Held that division was properly required between claims to the railroad-car and claims covering the combination between the car, the window-cash, and a lock for the same, since the devices are recognized by inventors and manufacturers as separate and independent articles of manufacture and sale, and from this it results that these devices possess a capacity for independent use.

ON petition.

REINVENTIBLE CASE.

Application of George M. Brill filed September 24, 1901, No. 76,593.

Mr. Joseph L. Levy and Messrs. Wilkinson & Fisher for the applicant.

ALLEN, Commissioner:

This is a petition from the action of the Examiner requiring that claims 5, 6, 8, 9, and 10 be divided from the remaining claims in the above-entitled application.

The invention relates to improvements in railroad-cars, and the claims, with the exception of those constituting the group above specified, cover improvements in said cars.

1115

Claims 5, 6, 8, 9, and 10, however, are drawn to cover alleged combinations between the car, window-sash, and a specifically-constructed lock for securing the window-sash to the car proper.

The broad combinations set forth in these claims are, as stated by the Examiner, old in the art, and the references cited by the Examiner from the class of Builders' Hardware, Sash-Fasteners, Mid-Rail, substantiate his statement. The invention covered in this group of claims is classified in class 10, Builders' Hardware, and applications for patents in the same are examinable in Division XX.

The invention covered in the remaining claims is classified in class 105, Railway Rolling-Stock, and applications for patents on the same are examinable in Division XXXIV.

Not only is the invention covered by claims 5, 6, 8, 9, and 10 regarded by this Office in its scheme of classification as a separate and independent invention from that covered in the remaining claims, but it is recognized as a separate article of manufacture and sale by inventors and manufacturers, and from this it results that these devices possess a capacity for independent use.

In view of this state of facts it follows that the requirement of division was a proper one.

The petition is denied.

EX PARTE SPILLER.

Decided May 15, 1902.

ABANDONED APPLICATION—INEFFECTIVE ACTION.

Where several claims are rejected by the Examiner and at the end of the time allowed by law for action the applicant requests reconsideration of some claims and says he intends to file an affidavit under Rule 15 as to others. Held not such action as the condition of the case requires and that it is abandoned.

ON petition.

FRAMES, ETC., FOR SELF-PROPELLING VEHICLES.

Application of Harry A. Spiller filed July 13, 1900, No. 23,495.

Messrs. Macleod, Calver & Randall for the applicant.

ALLEN, Commissioner:

This is a petition for a review of the Examiner's action holding that the action by applicant dated March 10, 1902, is not such as to put the case in condition for further action by the Office and save it from abandonment.

It appears that claims 1 to 7 were rejected on reference to a certain English patent and claims 9 and 10 on reference to a certain United States patent in an action by the Examiner dated March 26, 1901. On March 10, 1902, applicant filed a letter in this Office requesting reconsideration of the action on claims 9 and 10 and stating that he would file an affidavit antedating the English patent cited against claims 1 to 7.

It is clear that the only action which the Examiner could make in response to this letter would be to reconsider claims 9 and 10 and postpone the further consideration of claims 1 to 7 until the time when applicant might see fit to file his affidavit to

[Vol. 98,

overcome the reference cited against them. The reconsideration of claims 9 and 10, in case the references were still held to be pertinent, could not result in a final rejection, because such an action is not proper until all claims are in condition for final action. The action by applicant was not, therefore, an action having the effect of making a substantive advance toward the closing of the prosecution of the case. (*Ex parte Vaughan et al.*, 97 O. G., 937.) Its purpose and effect could be nothing more than to "keep the case alive." It was not such an action as the condition of the case required.

The petition is denied.

EX PARTE BROWN.

Decided May 17, 1902.

DIVISION—FILTER AND COFFEE-CARTRIDGE.

Division was properly required between the claims which cover a particular structure of "percolator-cartridge" for use in a coffee-filter for making drip-coffee and claims covering combinations between the cartridge and the particular filter, for the reason that each of the inventions is independent of the other in that they possess the capacity for separate use.

ON petition.

FILTER AND COFFEE-CARTRIDGE.

Application of Goodwin Brown filed January 17, 1902, No. 90,170.

Mr. Thomas Ewing, Jr., and Mr. Vernon M. Dorsey for the applicant.

ALLEN, Commissioner:

This is a petition from the action of the Examiner requiring division between claims 1 to 9, inclusive, and claims 10 to 15, inclusive, of this application on the ground that these two groups of claims cover separate and independent inventions.

Claims 1 to 9, inclusive, cover a package constructed in a certain specific way which is arranged to hold coffee or similar material. This package is called a "percolator-cartridge" and is to be used in conjunction with a dripper when placed over a coffee-pot for the purpose of making drip-coffee.

The petitioner states on page 1 of the specification that—

a percolator-cartridge made in accordance with this invention forms a convenient package for the transportation and use of the substance contained therein, and as such may be an article of merchandise.

Claims 10 to 15, inclusive, are drawn to cover combinations of elements. One of the elements in this combination is the "percolator-cartridge," more or less specifically stated. That this particular cartridge is useful with the particular form of dripper is self-evident; but it is equally clear that many other forms of percolator-cartridge could as well be used in the combination in the place of the particular one invented by the petitioner and that the cartridge here described could be used with many other forms of drippers for the purpose specified.

The package or cartridge covered in claims 1 to 9, inclusive, forms a distinct subject-matter of invention from the combination covered in claims 10 to 15, inclusive. Each of these inventions is separately classified in this Office, and they are in-

No. 10.]

dependent of each other, in that they possess the capacity of separate use.

The relation between this particular form of "percolator-cartridge" and the combination between the same and the dripper is very similar, as far as the question of independence of invention is concerned, to that of a particular form of explosive cartridge and the particular firearm in which it is to be used.

The inventions covered by the two groups of claims should be presented in separate applications.

The petition is denied.

EX PARTE ALABAMA TUBE AND IRON COMPANY.

Decided May 17, 1902.

TRADE-MARK—"ALABAMATUBE" REFUSED REGISTRATION.

The word "Alabamatube" can mean nothing different from the two words "Alabama tube"—that is, a tube produced in Alabama. The word is geographically descriptive and cannot be registered as a trade-mark for tubes.

ON appeal.

TRADE-MARK FOR IRON AND STEEL TUBE.

Application filed April 3, 1902, No. 65,525.

Mr. Chas. Denegre for the applicant.

ALLEN, Commissioner:

This is an appeal from a decision of the Examiner of Trade-Marks refusing to register as a trade-mark for iron and steel tubes the word "Alabamatube."

Appellant is a corporation located in the city of Birmingham, in the State of Alabama, and the word for which registration is sought is composed of the two words *Alabama* and *tube*.

The word "Alabama" alone is clearly not entitled to registration because it is purely geographical. As stated by the Supreme Court of the United States in *Columbia Mill Company v. Alcorn et al.*, (55 O. G., 1918,) it is one of those—

"... words in common use as designating locality, section or region of country."

The same Court in *Conal Company v. Clark* (13 Wall., 811) said:

These merely geographical names cannot be appropriated and made the subject of exclusive property.

The word "tube" is the name of the product and cannot be a valid trade-mark.

It is contended by applicant that by combining these two words into one the result is a word which is arbitrary or fanciful in meaning. Such a conclusion is, however, entirely unwarranted, for clearly the word "Alabamatube" can mean nothing different from the two words "Alabama tube"—that is, a tube produced in Alabama. The word is geographically descriptive.

The decision of the Examiner of Trade-Marks was right, and it is accordingly affirmed.

EX PARTE DOLAN.

Decided May 16, 1902.

APPEAL—DISCOVERY BY NEW GROUNDS FOR REJECTION—PRIORITY.

If the Examiner discovers new reasons for rejection after appeal has been taken, he should direct the attention to it of both the appellant and the Examiners-in-Chief. The appellant may then elect to proceed with the appeal or to withdraw it. (*Ex parte Mezey*, 55 O. G., 935.)

[Vol. 98,

ON protest.

BAR-BURNERS AND BAR-BURNING PROCESS.

Application of Edward J. Dolan filed June 27, 1898, No. 684,643.

Mr. E. N. Dickerson for the applicant.

ALLEN, Commissioner:

This is a protest against certain statements made by the Examiner in his answer to an appeal to the Examiners-in-Chief now pending in the above-entitled application.

It appears that in answer to the appeal the Examiner referred to a certain burner of the fish-tail type which he had purchased and used in a demonstration before applicant's attorney. No reference had been made to this burner or to the demonstration in the record of the case. The attorney then filed this protest, because, in his opinion, the statements are—

highly improper and should be expunged from the record as they are not in themselves legal grounds for rejection.

It is of course improper for an Examiner to refer in his answer to an appeal to the Examiners-in-Chief to matters constituting a ground for rejection which have not been made of record in the case. If he shall discover new reasons for rejection after appeal has been taken, the proper course for him to take is set forth as follows in the decision in *ex parte Mezey*, (55 O. G., 935):

The proper course to be pursued by an Examiner, on discovering a new ground for rejection subsequently to an appeal to the Examiners-in-Chief is to direct the attention to it of both the appellant and the Examiners-in-Chief. The appellant may then elect to continue the prosecution of the appeal or to withdraw the appeal and be heard by the Primary Examiner.

It appears from the record that the Examiner has now complied with the requirements set forth above and has notified applicant that he may either proceed with the appeal or may have further consideration of the case before the Examiner. There seems to be no basis for protest against his action, therefore, since the sufficiency of the grounds for rejection is a question to be reviewed in the first instance by the Examiners-in-Chief.

The protest is dismissed.

EX PARTE VOGEL AND SON.

Decided May 17, 1902.

1. TRADE-MARK—"MAPLE-LEAF" ANTICIPATED BY "SILVER LEAF."

A trade-mark consisting of the words "Maple Leaf" and the representation of maple-leaves refused registration upon a registered mark consisting of the words "Silver Leaf" and the representation of maple-leaves.

2. SAME—IDENTITY OF MARKS—APPEARANCE AS WELL AS SOUND TO BE CONSIDERED.

In determining the question whether or not one mark so nearly resembles the other as to cause confusion in the minds of the public the appearance of the marks is as important as the sound of the words used therein when those words are spoken.

ON appeal.

TRADE-MARK FOR LARD.

Application of Jacob Vogel and Son filed December 18, 1895, No. 59,490.

Messrs. Murray & Murray for the applicants.

ALLEN, Commissioner:

This is an appeal from the decision of the Ex-

No. 10]

aminer refusing to register as a trade-mark for said the words "Maple Leaf" arranged in a curved line and the illustration of a group of three maple-leaves below the said words.

Registration is refused on the trade-mark of T. R. Jenkins and Son, No. 5,094, registered March 8, 1878, and of Swift and Company, No. 24,512, registered April 10, 1894.

The mark of Swift and Company consists of the words "Silver Leaf" arranged in a curved line and the representation of a group of two leaves, with their stems together, placed below the said words. The leaves in the registered mark are first described as "silver leaves;" but the mark is not confined to the use of any one color, for, as stated in the specification, "the color is not the essence of the trade-mark." The mark is specifically described as consisting of "the words 'Silver Leaf' and the representation of two leaves." In this latter description it is to be noticed that the limiting word "silver" is omitted before the word "leaves." The representation of the leaves in the registered mark is clearly that of maple-leaves. One of the varieties of maple is the silver or white maple.

In considering the identity of two trade-marks the appearance of the marks is as important as the sound of the words used therein when these words are spoken. Both senses are to be used in determining the question whether or not one mark so nearly resembles the other as to have the tendency to mislead and to cause confusion in the minds of the purchasing public.

The mark sought to be registered by the appellant is so nearly like the mark registered by Swift and Company as to have the tendency to mislead and to cause confusion in the minds of the purchasing public, and for this reason the registration of this mark was properly refused. (*Ex parte Kaufmann and Bloche*, 84 O. G., 145; *ex parte Kingan and Company*, 97 O. G., 2085.)

The decision of the Examiner refusing registration of the mark on the ground that it is anticipated by the registered mark of Swift and Company is affirmed.

Having reached this conclusion, it is not necessary to consider the formal matters raised by petition. The petition is therefore dismissed.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia. SWIHART v. MAULDIN.

Decided April 1, 1902.

1. INTERFERENCE—PRIORITY—UNSUCCESSFUL DEVICE.

Where S. alleges the earlier dates of conception and reduction to practice, but the evidence shows that his first machines were unsuccessful and that he did not construct a satisfactory machine until after he had seen M.'s invention, *Held* that the decision awarding priority to M. must be affirmed.

2. SAME—SAME—DELAY IN APPLYING FOR PATENT—CONDUCT IN CONNECTION WITH CLAIM.

Where S. was engaged in the special work of devising means to remedy imperfections in scales of the class in controversy,

having taken out several patents upon that line; and where he claims to have completed the particular invention in issue, *Held* that his failure to apply for a patent until six months after he had seen M.'s device is peculiarly significant.

3. SAME—SAME—BARRER OF PRIOR—CONCURRENT DECISIONS.

Where an appellant comes to the court as the junior applicant and with three concurrent decisions of the tribunals of the Patent Office against him, *Held* that the presumption is strongly against his claim as the prior inventor.

4. SAME—SAME—IDENTITY OF INVENTIONS NOT CONSIDERED.

The court will not except in extreme cases go behind the declaration of interference in order to determine the question of identity of the inventions claimed by the parties.

Messrs. Thurston & Bates for the appellant.

Messrs. Church & Church for the appellee.

MORRIS, J.:

This is an appeal from a decision of the Commissioner of Patents (99 O. G., 665) in an interference case, wherein the subject-matter in controversy is an improvement in spring-balance scales stated in the following issues:

1. Is a spring-balance scale, the combination of a spring-suspended runner having on its lower end means for suspending the load, with a fixed dash-pot cylinder, its plunger, and a plunger-rod which is flexibly connected at one end with the runner and at the other end with the plunger.

2. Is a spring-balance scale, the combination of a cylindrical scale-case having a hole in its lower end, and a spring-suspended runner which extends out through said hole and has on its lower end means for suspending the load, with a pneumatic cylinder and means for suspending the load, with a pneumatic cylinder closed at one end and open at the other, and having at its closed end external wings which are secured to the cylindrical scale-case, a plunger movable in said cylinder, and a plunger-rod which is flexibly connected at one end with the plunger and at the other end with the runner.

The invention is stated to consist in the flexibility of the plunger-rod at both of its extremities; and this is construed by one party to mean universal flexibility in all directions, and by the other general flexibility backward and forward and side-wise. In the second issue there is an additional new feature in the addition of "external wings." All the other elements of both combinations are old and well known in the art.

Swihart, the appellant, who is the junior applicant, and whose application was filed on November 1, 1897, alleges in his preliminary statement that he conceived and disclosed the invention in question on or about November 1, 1896; that he never made a drawing or model of it; but that he reduced the invention to practice on or about December 24, 1896; and that the National Computing Scale Company, the assignee of the invention and application, has manufactured and sold more than four thousand spring-balance scales embodying the invention.

Mauldin, the appellee and senior applicant, whose application was filed on May 8, 1897, nearly six months before that of Swihart, alleges in his preliminary statement that he conceived the invention in the early part of the year 1897; that he explained it and made sketches illustrative of it within a week after his conception of the idea; that a model of it was made within two weeks before its reduction to practice; that he embodied the invention in a full-sized scale and successfully operated the same and reduced the invention to practice in March or April of 1897, since which time many thousands of scales embodying the invention have been made and sold by him and by his licensee and assignee, the Computing Scale Company.

[Vol. 99. Pa. 10.]

Upon the testimony taken in the case, all the tribunals of the Patent Office, while concurring in the recognition of Swihart's priority of conception of the invention, also concurred in holding that Mauldin was the first to reduce it to practice; and they awarded judgment of priority of invention to the latter on the ground of Swihart's lack of diligence. From the Commissioner's decision to that effect Swihart has appealed to this court.

There has been a suggestion in argument that the device of Swihart differs from that of Mauldin in the fact that the flexibility of the plunger-rod in the former is stated to be of a universal character, that is, in all directions, while the flexibility in Mauldin's device appears to be more limited, being only sidewise and backward and forward. It is not entirely apparent to us what the purpose is of this suggestion. If it be to show that the two devices are patentably different, and therefore that there is no interference in fact between the parties, we have repeatedly held that, except in extreme cases, we will not go behind the declaration of interference in order to determine the question of identity of invention. If, on the other hand, the suggestion be made merely to show the superiority of Swihart's device, it is very plain that this consideration can have no influence in the determination of the question of priority of invention.

With reference to the merits of the case, the appellant comes here, not only as the junior applicant required to establish his case by a preponderance of evidence, but also with three concurrent decisions of the tribunals of the Patent Office against him, a fact which imposes upon him a still greater burden of proof in this court, as we have repeatedly held. It is true that, in the Board of Examiners-in-Chief, there was dissent; but this does not materially alter the conditions. But apart even from this burden of proof upon the appellant, we think that he has wholly failed to establish his case against the appellee, and that the preponderance of evidence is greatly in favor of the latter.

There would seem to be no ground left to question the fact that the appellee conceived the invention in the latter part of April, 1897, immediately reduced it to practice, and applied for a patent on May 8, 1897, a few days thereafter. This does not seem to be controverted by the appellant. At all events, it is fully established by the testimony; and it is held to be the fact by all the tribunals of the Patent Office. It is unnecessary to enter into the proof of it in any detail.

The testimony on behalf of the appellant is of the most unsatisfactory character: some of it is open to the gravest suspicion. While he states in his preliminary statement that he conceived the invention about November 1, 1896, and reduced it to practice in December of 1896, yet he shows conclusively by his own testimony, which however is full of contradictions, that there was no attempted reduction whatever to practice by him, and probably even no conception of the idea, before the latter part of February, or the month of March, 1897. What he did then was confessedly unsuccess-

[Vol. 99.

cessful. Not until after knowledge of Mauldin's invention was communicated to him, which was almost immediately after it was made, did he construct a successful device.

A very peculiar circumstance about the case is that, although his special work with the company by which he was employed and which is the assignee of his application, was to devise means to remedy the imperfections complained of by the public in the computing-scales then in use, and he had taken out patents for previous inventions in the same precise line, and although he and his company knew of Mauldin's invention immediately after it was made, in May of 1897, yet he did not apply for Letters Patent until six months afterward.

Our examination of the testimony in this case leads us to the same conclusion that was reached by the Commissioner of Patents. To his exceedingly careful and well-considered opinion we can add nothing; and we adopt his decision that judgment of priority of invention is due and should be awarded to the appellee James L. Mauldin.

The clerk of the court will certify this opinion and the proceedings in this court in the premises according to law.

Court of Appeals of the District of Columbia.

IN RE VERLEY.

Decided April 2, 1902.

1. PATENTABILITY—OZONE APPARATUS—ANTICIPATION.

An apparatus for producing ozone by the use of electrical currents of high frequency *Held* not patentable in view of certain patents to Tesla cited. (Decision of the Commissioner, 99 O. G., 1221, affirmed.)

2. ANTICIPATION—COMBINATION—PARTS OLD IN SEPARATE PATENTS.

Where the claim covers an ozone apparatus in combination with particular means for producing currents of high frequency, *Held* anticipated by two patents, one disclosing the high-frequency apparatus used with electric lights and the other disclosing an ozone apparatus supplied by a different form of high-frequency apparatus.

3. SAME—INVENTION—DISCOVERY OF COMBINATION IS PRIOR ART.

Held that there was no invention in using a Hartman oscillator in an ozone apparatus when it had been used in other devices to obtain electric currents of high frequency and an ozone patent had described the use of devices of that class with an oscillator.

Mr. Philip Masro for the appellant.

Mr. John M. Cull for the Commissioner of Pat-

ents.

MORRIS, J.:

This is an appeal from the decision of the Commissioner of Patents, wherein he refuses to grant a patent to the applicant Albert Verley, of Courbevoie, France, for an alleged invention in electrical appliances for the production of the gaseous element known as ozone. The claim of invention is described as follows:

Is an electrical machine for producing ozone, the combination with the secondary circuit of a transformer, of a condenser connected in and adapted to be charged by said circuit, and an oscillation apparatus, into which said condenser discharges its electricity, one plate of the oscillation apparatus, and the other plate of the other condenser, having an interrupter or interrupter in its connection with the other plate of the oscillation apparatus.

Ozone, which is found to be useful in the manu-

facture of

facture of perfumes and flavors, is produced by electrical action as the result of exceedingly rapid oscillations, or oscillations of high frequency, as they are called, in an electric circuit; and the volume of ozone developed is in proportion to the frequency of oscillation. To effect the desired result the applicant uses what is known as the "Herzian exciter," or air-space, which gives rise to electrical waves of very short duration and very great frequency, amounting to millions and even billions in a second of time; and he locates his condenser, exciter, and oscillator all in the secondary circuit of the transformer. He has received a German patent for this appliance, apparently since the date of his application in the present proceeding. Whether he has received one from his own country, France, does not appear.

The application here has been rejected on the ground of anticipation of the invention in three several patents issued to Nikola Tesla—one, No. 454,622, dated June 26, 1891, purporting to be for a "system of electric lighting;" a second, No. 468,418, issued November 3, 1891, purporting to be for a "method of and apparatus for electrical conversion and distribution;" and the third, No. 538,177, issued September 23, 1896, which is specifically for an "apparatus for producing ozone." The first and second of these patents show appliances of the same general character as that of the present applicant. The appliance of the third patent is somewhat different; but the specifications of this patent refer to the two previous patents as showing appliances of the same kind that might be used for the same purpose.

All the tribunals of the Patent Office held that, in view of these patents to Tesla, there was now no patentable novelty in taking the appliances of the first and second patent and using them for the same purpose as that of the third patent, as Tesla himself had indicated might be done: and this they held was all that the present applicant did.

From the decision of the Commissioner of Patents to that effect the applicant has appealed to this court.

The appellant's contention is merely that he uses the Herzian exciter to produce ozone, while Tesla does not use that means for the same purpose, but only electrical currents of ordinary high frequency. But inasmuch as Tesla in his first and second patent does use the Herzian exciter, and that in the specifications of his third patent he says that the appliances of the other two patents may also be used for the production of ozone, as well as the

special appliance which he does use for that special purpose, we concur with the tribunals of the Patent Office in holding that this was a plain anticipation of Verley's idea. An attempt is made to distinguish between the Herzian exciter and other apparatus for the production of electric currents of high frequency, and between electrical currents having oscillations of twenty or thirty thousand a second and those having billions of such oscillations; but we fail to find any warrant for the distinction. The difference is plainly one of degree, not of kind. Moreover, Tesla expressly refers to currents of high frequency having many millions of oscillations a second. We can, therefore, find no patentable novelty in the use of the Herzian exciter to produce ozone.

There would seem to be some advantage in the applicant's location of his condenser, exciter and oscillator in the secondary circuit of his transformer, instead of having them in the primary circuit, where Tesla places them. It would seem that this special location tends to prevent the formation of arcs across the exciter or air-space, and that such prevention is desirable in the production of ozone. If there is patentable novelty in this arrangement, as possibly there may be, we presume that a patent would be allowed upon application and specifications distinctly directed thereto. The question of the patentability of the appellant's device in that special regard does not seem to have been passed upon by the Commissioner of Patents, or by the other tribunals of the Patent Office, except by their general refusal of a patent, notwithstanding that the point seems to have been made before all of them by the applicant's counsel. But we have no means of ascertaining on this appeal whether the result of the appellant's location of his condenser would be as claimed, or whether there is such superiority in it over Tesla's device as would justify its being regarded as patentable invention. There are modes by which this can be determined; and we think that the appellant should be remitted to some of those modes for the establishment of this special claim, if he can establish it.

It is our conclusion that no sufficient reason has been shown to induce us to disturb the decision of the Commissioner of Patents, and that the decision should be affirmed. It is accordingly hereby affirmed.

The clerk of the court will certify this opinion and the proceedings of the court in this cause to the Commissioner of Patents according to law.

Attorneys.
DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 4, 1902.
This Office has been advised by the Secretary of the Interior of the disbarment of the following attorneys from practice before the Department or any Bureau thereof: John Wainwright, Wilmington, Del., May 10, 1902; Lindsey Steele, Chester, Ill., May 10, 1902.
C. M. IRELAND,
Chief Clerk.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 4, 1902.
This Office has been advised by the Secretary of the Interior that Department Order of April 20, 1899, disbarring Thomas J. Devitt, of Montpelier, Vt., from practice before the Department and its Bureaus was rescinded May 21, 1902.
C. M. IRELAND,
Chief Clerk.

Access to Pending Applications.
Hereafter no person except the applicant, the assignee whose assignment is of record, or the attorney of record will be permitted to have access to the file of any application, except as provided for under the interference rules, unless written authority from the applicant, assignee, or attorney, identifying the application to be inspected, is filed in the case to become a part of the record thereof, or upon the written order of the Commissioner, which will also become a part of the record of the case.

Roster of Registered Attorneys.

An alphabetical list of the individuals and firms registered in this Office under the provisions of Rule 17 of the Rules of Practice, as amended August 4, 1897, corrected to January 2, 1902, has been published, and copies will be furnished at the price of ten cents each, two five-cent coupons being acceptable in payment therefor.

Registrants are requested to give notice of any error that appear in the list as published or any change of address since the list was prepared for publication.

Any solicitor, agent, or attorney who, in circulars or advertisements or otherwise, refers to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of his professional standing, does so without authority.

Hearings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 28, 1902.

Notice is hereby given that there will be no cases placed upon the docket to be heard by either the Commissioner or the Assistant Commissioner during the months of July and August, 1902.

F. I. ALLEN,
Commissioner.

PATENTS

GRANTED JUNE 10, 1902.

701,824. COMBINED TABLE AND GUARD ATTACHMENT FOR SEWING-MACHINES. RALPH H. ANDERSON, Philadelphia, Pa. Filed Dec. 28, 1901. Serial No. 87,176. (No model.)

Claim.—1. A combined table and guard attachment for sewing-machines, comprising a plate or table adapted to be attached to a fixed part of the machine, and an upwardly-extending shield having the form of a conical frustum in cross-section, curved to said table and adapted to enclose the machine-arm, substantially as described.

2. A combined table and guard attachment for sewing-machines, comprising a plate, adapted to overlap the machine-table, an upwardly-extending conical shield adapted to enclose the machine-arm, and means for attaching said plate to the machine-table, substantially as described.

3. A combined table and guard attachment for sewing-machines, comprising a plate adapted to be attached to the machine-table, an upwardly-extending shield having a conical curved, reduced lower portion and a flaring upper portion adapted to enclose the machine-arm and means for attaching said plate to the machine, substantially as described.

4. A combined table and guard attachment for sewing-machines, comprising a plate adapted to be attached to the machine-table having an integral ear or flange extending from one end thereof and a downwardly-extending apron attached to one edge, an integral conical curved shield extending from the other end of said plate, said shield where connected to said plate having a gradually upwardly curving surface and reduced at its lower portion and fixed above to enclose the machine-arm and means for attaching said plate to the machine, substantially as described.

701,825. SMOOTHING-IRON. EDWARD F. ALDRICH, Covington, La. Filed Sept. 12, 1901. Serial No. 78,268. (No model.)

Claim.—1. In a smoothing-iron, a fuel-chamber having a flared or corrugated bottom, lateral air-flues open along their lower edges into said bottom, an end flue in the plane of the lateral flues at the heel of said iron connecting the lateral flues, an opening in the rear wall of said heel in the horizontal plane of said connecting-flue for leading the exhaust-air horizontally or directly into said connecting-flue, combined with a three-part damper consisting of an open part, a reversed part, and a closed part arranged as that any of said parts can be brought to coincide with said opening in the heel of the iron.

2. In a smoothing-iron, a fuel-chamber having a flared or corrugated bottom, an air-admission opening thereto in the heel of the iron in approximately the plane of the bottom, combined with a three-part damper comprising an open part, a reversed part, and a closed part, said damper being journaled so that any of said parts can be brought to coincide with the said air-admission opening.

701,826. INVALID RECLINING-CHAIR. EDWARD W. ANDERSON and EDWARD L. JOHNSON, Nevada, Mo. Filed Nov. 14, 1901. Serial No. 82,280. (No model.)

Claim.—The combination with a flexible chair-seat section having a double reinforced surrounding central opening therein, of a detachable rectangular flexible pad provided with a central opening, a downwardly-projecting curved flexible tube detachably connected with the reinforced opening, and a conical-shaped flexible apron secured to the tube and adapted to coast with the pad, substantially as and for the purpose specified.

701,827. SEWAGE-DISPOSAL PLANT. GEORGE E. ANDERSON, JOHN W. SEYMOUR, and ALEXANDER LOPEZ, New York, N. Y., assignors to the United States Sanitary and Utility Sewage Disposal Company of New Jersey, New York, N. Y. Filed Aug. 5, 1901. Serial No. 79,602. (No model.)

Claim.—1. In a sewage plant, the combination of a series of vertical filters and tanks arranged side by side so that the effluent drains side-wise from one to the other, a series of pipes adapted to drain the final tank of said series of filters, suitable spraying attachments for distributing said drainage, means for creating said spray consisting of blowers for driving in the pure air and drawing out the final air from said spraying-chamber and means for burning the gases in said air as it comes through the spray.

2. In a sewage plant, the combination with a series of suitable vertical filtering devices arranged side by side, drain-pipes therefor provided with branch pipes and spraying attachments to distribute and aerate the effluent as it is drained from the filters, a chamber in which said spraying is effected, a blower at either end of said chamber for forcing air in and out, for the purpose of aerating the effluent, and a return for destroying the gases in the air that come from said chamber, substantially as described.

3. The combination in a sewage plant, of a series of tanks and filters intermediate of said tanks, the whole arranged to insure the drainage of effluent from one to the other, connections for draining the last of said series, a system of perforated piping connected with said drainage adapted to finely distribute said effluent on a large area of surface, means for thoroughly aerating said distributed water as it falls from the pipe, a filter

ing-bed through which said water flows and perforated drains beneath said bed to convey the water therefrom.

4. In a sewage plant the combination with a filtering and settlement tank, of a series of fixed suction-pipes located therein, a track extending around said tank and portable pump mounted upon said track adapted to be successively connected with each of said suction-pipes, substantially as described.

5. In a sewage plant, the combination with a series of settlement-tanks arranged adjacent to each other, filters intermediate of said tanks to permit the effluent to drain from one to the other, a stationary main suction-pipe extended across said tanks, branch pipes extended into each tank from said main pipe, valves for cutting out any or all of said branch pipes and a pump for said pipes.

6. In a sewage plant the combination with a series of filtering-tanks for containing sewage and arranged side by side, of means for removing the sludge therefrom consisting of a series of transverse pipes extending across said series and having depending members for each section with suitable valves for opening and closing the several parts thereof and a portable pump adapted to be connected with either of said pipes to draw up said sludge and convey it to a suitable receptacle.

7. In a sewage plant, the combination with a series of tanks for containing sewage arranged adjacent to each other and filters intermediate of said tanks, of means for removing the sludge therefrom consisting of stationary sections of piping covering adjoining parts of the tanks, branch pipes on each of said sections, valves for opening and closing the several branches in said sections, a track adjacent to the tanks and a portable pump located upon the track adapted to be moved from one section of piping to another for attachment therewith to remove the sludge from the tanks through said sections and discharge it into any suitable vehicle.

8. In a sewage plant the combination with a receiving-tank, of a second tank adjacent thereto, one or more screens dividing said tank, the same adapted to fit in suitable ways and to float with the effluent in a manner to retard the light substances in said effluent, substantially as shown and described.

9. In a sewage plant, the combination with a receiving-chamber, of a mixing-wheel located therein adapted to receive the inflow from the sewer, means for grinding and feeding fine or coarse other suitable disinfectant thereon, tanks arranged adjacent to said mixing-chamber, valves for controlling the flow of sewage from said chamber to each of said tanks, a series of vertically-arranged tanks and filters and means for raising the effluent from the first-named tanks.

10. In a sewage plant, the combination with receiving-tanks, of a pump adapted to raise the effluent therefrom, a series of vertical tanks and filters through which the effluent is passed, blowers for purifying the effluent as it comes from said vertical filters and a robot to receive and burn the air as it comes from the blowers, a horizontal filtering-bed upon which said effluent is freely distributed during aeration.

11. In a sewage plant of the class described, the combination with

a receiving-tank, a series of vertical filters located side by side, means for feeding the water from the tank to the filters, a storm-cover connected with the tank adapted to receive the effluent therefrom after it reaches a given height, a drain-pipe for said vertical filters with perforations for distributing and aerating the water as it comes from said filters, a final horizontal filtering-bed through which said effluent passes, and drains for said bed connected with the storm-cover adapted to receive the purified water.

701,828. MAT-CUTTER. CHARLES ARNDT, Chicago, Ill., assignor to John E. McDonald, Chicago, Ill. Filed Nov. 4, 1901. Serial No. 51,082. (No model.)

Claim.—1. In combination, the guide-plate provided with oval grooves, a traveler-plate means for coming said plate to move in conformity with said oval grooves and an arm rigidly secured to said traveler-plate.

2. A guide-plate provided with guide-grooves therein, a traveler-plate, rollers on said latter plate to engage said grooves, an arm rigidly and adjustably secured to said traveler-plate and carrying a cutter.

3. A guide-plate provided with grooves adjustable holding-points, a traveler-plate provided with rollers or equivalent means adapted to engage with said grooves, an arm adjustably secured to said traveler-plate, a clotted center-head on said arm, a handle adapted to engage with said dot, means for adjustably holding said handle and means, comprising a pair of handles, for operating said arm and cutter substantially as described.

701,829. REUSE. SALON E. BARON, Paterson City, Cal. Filed Oct. 18, 1901. Serial No. 73,966. (No model.)

Claim.—1. A brush comprising brush fiber arranged in a bunch, a filler-block inclosed therein, a resilient clamping member adapted to engage the bunch and provided with a tang, the free end of the said member being located adjacent to the point of juncture of the tang, a handle loosely mounted on the tang and adapted to engage the said free end, and means carried by the tang for moving the handle into engagement with the said end.

2. A brush comprising brush fiber arranged in a bunch, a resilient clamping member having oppositely-disposed outward bulges and provided with a tang, the free end of the member being arranged adjacent to the point of juncture of the tang, a filler-block inclosed in that portion of the bunch included between the bulges, a handle mounted on the tang, and means for moving the handle into engagement with the free end of the clamping member to bind the brush therein.

3. A brush comprising brush fiber arranged in a bunch, a resilient clamping member having oppositely-disposed outward bulges and constricted edge portions, and provided with a tang, the free end of the member being arranged adjacent to the point of juncture of the tang, a filler-block inclosed in that portion of the bunch included between the bulges, a handle mounted on the tang, and means for moving the handle into engagement with the free end of the clamping member to bind the brush therein.

701,830. PARTITION FOR MOLD-FLASKS. HARRY W. BELL, New York, N. Y. Filed Jan. 31, 1902. Serial No. 91,968. (No model.)

Claim.—1. A division-board or partition for molds for building-blocks, comprising a structure provided with a facing of relatively thin and flexible material the greater area of which is free or unattached and possesses

the capacity to be peeled from the surface of the molded block, said facing also having attached areas, whereby the facing is caused to restore itself to the side of said structure as the partition is drawn away from the block.

2. A division-board or partition for molds for building-blocks, comprising a structure provided with a facing of relatively thin and flexible sheet metal the greater area of which is free or unattached, and possesses the capacity to be peeled from the surface of the molded block, said facing also having attached areas, whereby the facing is caused to gradually restore itself to the side of said structure as the partition is drawn away from the block.

3. A division-board or partition for molds for building-blocks, comprising a structure provided with a facing of relatively thin and flexible material, and means clamping the facing to the structure at the edges, said facing having the capacity to be peeled from the surface of the molded block on separation of the partition from the block.

4. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of sheet metal, and means independent of the side pieces of the flask also of metal holding the facing in place and soldered thereto.

5. A partition for molds for plastic blocks, comprising a structure provided with a facing having the capacity to be drawn outwardly from said structure by adhesion of the material of the block thereto, on separation of the partition from the block, and to peel from the surface of the block on gradually-changing lines; and means securing said facing to the partition at portions only thereof whereby the unsecured areas or portions are caused to restore themselves to the side of the structure on similarly-changing lines with each increment of force applied to separate the partition from the block.

6. A partition for molds for plastic blocks, comprising a structure provided with a facing of relatively thin and flexible sheet metal having the capacity to be drawn outwardly from said structure by adhesion of the material of the block thereto, on separation of the partition from the block, and also to peel from the surface of the block on gradually-changing lines; and means securing said facing to the partition at portions only thereof, whereby the unsecured areas or portions are caused to gradually restore themselves to the side of the structure on similarly-changing lines with each increment of force applied to separate the partition from the block.

7. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of sheet metal, and means also of metal clamping the facing in place and soldered thereto.

8. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing, and a frame independent of the side pieces of the flask for holding said facing in place.

9. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing, and a frame of metal independent of the side pieces of the flask clamping the facing in place.

10. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of sheet metal, and a frame independent of the side pieces of the flask for holding said facing in place.

11. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of sheet metal, and a frame also of metal and independent of the side pieces of the flask for holding the facing in place.

12. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing, and a frame independent of the side pieces of the flask joined to the facing and holding the same in place.

13. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing, and a frame independent of the side pieces of the flask joined to said facing and holding the same in place.

14. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of

sheet metal, and a frame independent of the side pieces of the flask and joined to said facing and holding the same in place.

15. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of sheet metal, and a frame also of metal independent of the side pieces of the flask and joined to said facing and holding the same in place.

16. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing of sheet metal, and a frame also of metal soldered to said facing and holding the same in place.

17. A division-board or partition for flasks for brick and similar molds comprising a board or similar structure provided with a facing on either side thereof, and a frame bent to embrace the structure at the edges to hold the facings in place against the board, said frame being soldered along its edges to the facings.

18. A mold for building-blocks, comprising detachably-connected side portions and division-boards or partitions forming mold-spaces, each of said portions and partitions being provided with a facing of relatively thin and flexible material the greater area of which is free or unattached and possesses the capacity to be peeled from the surface of the molded block, said facings each also having attached areas whereby the facing is caused to gradually restore itself to the side of its support on drawing said portions and partitions away from the block.

19. A mold for building-blocks, comprising side portions having corresponding grooves at intervals of the lower surfaces thereof, and division-boards or partitions with their ends detachably fitting the grooves to form mold-spaces, each of said portions and partitions being provided with a facing of relatively thin and flexible material the greater area of which is free or unattached and possesses the capacity to be peeled from the surface of the molded block, said facings each also having attached areas whereby the facing is caused to gradually restore itself to the side of its support on drawing said portions and partitions away from the block.

701,831. MACHINE FOR GRINDING TROWELS. HARRY BROS. Frankford, Pa. Filed Dec. 31, 1901. Serial No. 97,911. (No model.)

Claim.—1. In a machine for grinding trowels, a trowel-block, a clamping-lever pivoted in one end thereof, a wire connected to the lever, the said wire passing through the said block at an angle, a cam-shaped lever pivoted in the block and connected to the wire, a pivoted arm upon the cam-shaped lever, a hook upon the said arm, a ratchet upon the side of the block adapted to engage the said hook, a plate upon the top of the block, the said plate having a depression and flanges, the bottom of the block having a central groove and corrugations substantially as shown and described.

2. In a machine for grinding trowels, a trowel-block, a clamping-lever pivoted in one end of the said block, a cam-shaped lever pivoted in the other end, a wire passing through the block at an angle, the said wire connecting the two levers, an arm pivoted to the cam-shaped lever, a hook upon the free end of the said arm, a ratchet upon the side of the block adapted to engage the said hook, a plate upon the top of the block, a depression and flanges upon said plate, the bottom of the block being curved, a central groove and corrugations upon the curved portion of the block, substantially as shown and described.

3. A machine for grinding trowels, in combination with a grind-

ring mounted in said groove, the said carriage consisting of similar curved handles, braces connecting the said handles, a tongue upon one of the said braces, an enlarged portion upon the said tongue, curved faces formed upon the said handles, a block having slots in the bottom thereof engaging the curved faces upon the handles, the said block connected by a chain to and operated by a foot-lever, the top of the block being curved, a central rib and corrugations upon the curved portions, a travel-block adapted to rest upon the first-mentioned block, substantially as shown and described.

4. A machine for grinding troughs, in combination with a grindstone, an adjustable horizontal bar, a groove in said bar, a rocking carriage mounted in said groove, a sliding block mounted upon said carriage, a foot-lever connected to and controlling said block, a travel-block mounted upon the first-mentioned block, substantially as shown and for the purpose set forth.

701,882. GAME OR PUZZLE. JOHN H. BURNETT and MCHEN L. ZIEHENDRUM, Philadelphia, Pa. Filed Sept. 10, 1901. Serial No. 74,935. (No model.)

Claim.—1. In a game or puzzle, a box having compartments and passages therebetween, obstructions in the passages, movable pieces varying in susceptibility to the movement of the box, means whereby the pieces may be magnetically connected and whereby the movement of one is communicated to the other.

2. In a device of the character described, a box, plates movable therein, rollers for supporting the pieces, the roller on one piece being more sensitive to the movement of the box than the roller on the other pieces and means for magnetically connecting the pieces.

3. In a game or puzzle, a circular box, a transparent cover placed over said box, a circular central compartment, concentric circular partitions arranged around the central compartment at a distance one from the other so as to form a series of circular passages in between each two partitions, openings formed through said partitions at suitable places, the bottom of the box adapted to be painted or printed to represent a spider-web, ridges slightly raised above the bottom of the box and extending across the openings through the partitions, two movable objects, one formed to represent a spider and the other a fly adapted to move along the passages, small wheels or rollers journaled underneath and in the body of said movable objects, said wheels or rollers resting upon the bottom of the box, the wheel or roller within the fly adapted to roll more easily than the wheel or roller within the spider, a piece of magnetized steel secured in one of the objects and projecting outward therefrom, a piece of soft iron secured in the other object and projecting outwardly therefrom, substantially as and for the purpose set forth.

701,888. TRAIN-PIPE COUPLING. GUY L. BURNAN, Birmingham, Pa. Filed Jan. 15, 1902. Serial No. 55,053. (No model.)

Claim.—1. In a device of the class specified, an automatic coupling comprising a male member having an opening or passage, a female member having an opening or passage in communication with the train-pipe, an automatic valve carried by the female member and adapted to be moved to open position and wholly out of the path of the flow of air by contact with the male member, said valve having a closing movement in the direction of the mouth of the female member and curving to keep the same clear from foreign matter, substantially as specified.

2. In a device of the class specified, a male member comprising a tubular portion having a closed end, there being an opening formed in the wall of said tube, packing-rings arranged on the periphery of said male member, a female member having an opening or passage in communication with the train-pipe, a spring-pressed valve situated in said female member and normally held in closed position, said valve being adapted to be opened by contact with the male member, and to be moved thereby wholly out of the path of the flow of air, and the packing-rings of the

male member serving to prevent leakage of air from the female member, substantially as specified.

3. In a device of the class specified, a coupling comprising interfitting male and female members having registering and communicating openings, the opening in one of said members being elongated to permit longitudinal play of said coupling members, without diminishing the flow of air.

4. In a device of the class specified, a male member comprising a tubular portion having a closed end and an opening for the passage of air, packing-rings disposed on said male member at a point to the rear of the air-passage, a female member having at its rear and a valve-containing chamber and coupled at a point intermediate of its length to the train-pipe, a cylindrical valve adapted to said female member, a buffer disposed on the end of said valve for contact with the male member, and a compression-spring situated within the female member and normally holding said valve in closed position.

5. In a device of the class specified, a male member comprising a tubular portion having an air-passage or opening, a female member comprising an elongated tubular body, a coupling arranged intermediate of the length of the female member and having a narrow elongated passage in communication with the train-pipe, said female member having an enlarged conical mouth, a valve arranged within the female member, packing-rings disposed on said valve, and a spring situated within the female member and normally holding said valve at a point adjacent to the mouth of the tubular body and serving to prevent the accumulation of foreign matter therein, substantially as specified.

6. In a device of the class specified, a pair of interfitting coupling members, and an automatic valve carried by one of said members and adapted to be opened by contact with the mating member, said valve when opened being wholly out of the path of the flow of air.

701,884. KNOCKDOWN CRATE. BERNARD E. ROTA, Newark, Mich. Filed Mar. 12, 1902. Serial No. 57,592. (No model.)

Claim.—1. A knockdown crate having side and end walls formed with horizontal top and bottom bars, the adjacent ends of said bars having a socket-and-tongue engagement one with the other, pins jointly connecting adjacent sockets and tongues, slanting interior upright corner-strips, and a separable bottom, said ends provided with ledges to support the bottom.

2. A knockdown crate having side and end walls formed with horizontal top and bottom bars, the adjacent ends of said bars having a socket-and-tongue engagement one with the other, pins jointly connecting adjacent sockets and tongues, interior slanting upright corner-strips, and a separable bottom, said ends provided with ledges to support the bottom, said corner-strips cut away at their lower ends to permit the bottom resting thereunder.

3. A knockdown crate having side and end walls formed with horizontal top and bottom bars, the adjacent ends of said bars having a socket-and-tongue engagement one with the other, pins jointly connecting adjacent sockets and tongues, interior slanting upright corner-strips, and a separable bottom, said ends provided with ledges to support the bottom, said corner-strips cut away at their lower ends to permit the bottom resting thereunder to hold the bottom from rising off from the support.

701,885. CONVEYER. GASTON A. BARNARD, Brooklyn, N. Y. Filed May 2, 1901. Serial No. 55,044. (No model.)

Claim.—1. A conveyor, a liquid-sealed flue, over and between the body of the conveyor and its running-gear, all in combination with means for propelling the conveyor in the said flue.

2. A conveyor, wheels journaled to the conveyor, a flue with its side walls extending between the body or buckets of the conveyor and the wheels thereof, all in combination with means for propelling the conveyor in the said flue.

3. The combination of a conveyor, wheels journaled to the conveyor, a trough below the conveyor, a flue extending from above the conveyor and between the body of the conveyor and the wheels thereof, and means for propelling the conveyor.

4. A conveyor, wheels carrying the conveyor, a flue with its side walls extending between the body or buckets of the conveyor and the wheels of the conveyor, in combination with an exhausting apparatus, and means to propel the conveyor.

5. A conveyor, wheels journaled to the conveyor, a liquid-sealed flue interposed between the body of the conveyor and the wheels thereof, in combination with an exhausting apparatus connected to the flue, and means for propelling the conveyor in the flue.

6. The combination of a conveyor, a trough below the conveyor, a flue covering the body of the conveyor, wheels of the conveyor located outside of the flue and the trough, and means for propelling the conveyor.

7. A cake-conveyor, a water-trough under and communicating the conveyor, a cooling-flue issuing the body of the conveyor and projecting into the said water-trough, chutes leading into the flue, means for spraying and quenching hot cake in its descent through the chutes, additional means for spraying and quenching the cake in its passage through the flue, means for preventing the cake choking up the flue, all in combination with an exhausting apparatus connected with said flue.

8. The combination of a water-trough, a cooling-flue projecting into the trough, a conveyor with its body located by the said flue and trough, and wheels of the conveyor located outside of the flue and trough, and means for propelling the conveyor through the said flue and trough.

9. The combination of a conveyor, a trough below the conveyor, a flue including the body of the conveyor, running-gear connected to conveyor outside of said flue, chutes leading into the flue, water-outlet pipes in the chutes, and means for propelling the conveyor through the trough and flue.

10. The combination of a conveyor, a trough below the conveyor, a flue over the conveyor, chutes leading into the flue, covers on the chutes, water-outlet pipes in the chutes, valves fitted in the said pipes, means to

operate the valves by the opening and closing of the covers, and means to drive the conveyor through the said trough and flue.

11. The combination of a conveyor, a trough below the conveyor and extending above the bottom of the conveyor, a flue covering the conveyor and projecting into the trough, chutes leading into the flue, water-outlet pipes in the chutes, a main water-supply pipe connecting the said outlet, covers swinging on the top of chutes, valves in the outlet-pipes, links connecting the covers and the said valves, and means to drive the conveyor.

12. The combination of a conveyor, a trough below the conveyor and projecting above the bottom of the conveyor, a flue covering the body of the conveyor and projecting into the trough, projecting pieces extending from the sides of the flue on the inside, cross-braces connecting the inside faces of the flue above the conveyor, chutes leading into the flue, and means for driving the conveyor.

13. The combination of a conveyor, a trough below the conveyor, a flue covering the body of the conveyor and projecting into the trough, projecting pieces extending from the sides of the flue on the inside, cross-braces connecting the inside faces of the flue above the conveyor, chutes leading into the flue, and means for driving the conveyor.

14. The combination of a bucket conveyor, a trough with a depression and elevated end, a flue over the buckets of the conveyor and extending into the trough, ends projecting from the flue and extending below and between the sides of the conveyor-buckets and the running-gear wheels journaled to the conveyor outside of the said flue, and means for driving the conveyor.

15. A conveyor, wheels carrying the conveyor, a trough secured below the conveyor, a flue fixed above the conveyor and projecting into the trough, between the body or buckets of the conveyor and the wheels thereof, in combination with an exhaust apparatus connected to the flue, and means for driving the conveyor.

16. The combination of a bucket conveyor, openings in the body of the bucket, combined frames and links carrying the buckets, wheels journaled to the frames, a trough secured below the buckets of the conveyor, the wheels of conveyor rolling on the top faces of the sides of the trough, a flue above the conveyor and extending into the trough, chutes leading into the flue, an exhaust-blower connected to the flue, means for driving the blower, covers on the chutes, spray-pipes in the chutes, valves fitted to said pipes, a main supply-pipe connecting the spray-pipes, covers on the chutes, links connecting the covers and the valves, sprocket drive-wheels, idler-wheels, guiding-curves for the conveyor, secondary outlets extending into the flue from the main water-supply pipe, and means for driving the conveyor.

701,886. FASTENING FOR SADDLE-GIRTH. GUYTON I. BURN, Kansas City, Mo., assignor of one-half to Frank H. Crocker, Kansas City, Mo. Filed Apr. 15, 1901. Serial No. 55,057. (No model.)

Claim.—1. A fastening comprising a base-plate, and an extension of said base-plate at one end thereof, and extending and downwardly ex-

tended legs upon said extension having recesses in their under surfaces, and a notch intermediate said legs, a downwardly-curved projection of the under surface of said extension of the base-plate in rear of said notch, an operating-lever, and an extension of said lever at an angle thereto and inwardly between said legs, having a curved depression in the upper surface bearing upon the downwardly-curved projection of the extension of said base-plate, and a keeper-plate having an opening for the operating-lever extending beneath said legs and engaging with the mid extension of the operating-lever.

2. In fastenings for saddle-girths, &c., an extended lever, a leg upon the free end of said lever, and ribs on said leg, a strap having a socket, a reinforcing-plate in said socket having spring sides bent upon the upper surface of said strap, and a bottom to said plate extending beyond the plane of the lower surface of the strap, and a covering-strip upon the bottom of said plate engaging with the lower surface of said strap.

701,837. BOLSTER FOR CARR. SAMUEL F. BURN, Columbus, Ohio. Filed Aug. 12, 1901. Serial No. 73,551. (No model.)

Claim.—1. A car-bolster comprising an integrally-formed compression member and strut, in combination with a single plate tension member, and means for securing the ends of the tension and compression members together, substantially as described.

2. A car-bolster comprising an integrally-formed compression member, and strut, in combination with a separate single plate tension member, and means for securing the said tension member and compression member together at the ends of the same, comprising end castings secured upon one side of the tension member, and rivets passing through the end castings, the tension member, and the compression member, substantially as described.

3. A car-bolster having a channel-iron compression member, said compression member having a center plate and side bearings formed integrally therewith, a tension member, a strut, and means for securing the compression member and tension member together at the ends of the same, substantially as described.

4. A car-bolster comprising an integrally-formed compression member and strut, in combination with a tension member, means for securing the ends of the tension and compression members together, and a separately-formed tension-member seat for said strut, substantially as described.

5. A car-bolster having an integrally-formed channel-iron compression member and strut, said compression member having flanges upon the strut side thereof, constructed to brace the strut, a plate-tension member, and means for securing the compression member and tension member together at the ends, substantially as described.

701,838. LEATHER-STRETCHING MACHINE. JOHN CALDWELL, Minneapolis, Minn., assignor to W. A. Holt Company, Minneapolis, Minn., a Corporation of Minnesota. Filed Jan. 4, 1902. Serial No. 34,578. (No model.)

Claim.—1. The combination with a leather-holder having a projection in rear of its leather-engaging means, of a coupling device provided with means for making laterally-variable pivotal connection with said projection, and means for adjustably and pivotally connecting the coupling device to a part of a stretching mechanism, substantially as set forth.

2. The combination with a leather-holder having a projection in rear of its leather-engaging means, of a coupling device having means for making laterally-variable connection with said projection, and means for

pivotally and adjustably connecting the coupling device to a part of a stretching mechanism, substantially as set forth.

3. The combination with a leather-holder having a projection in rear of its leather-engaging means, of a coupling device having a transverse slot converging to ward the leather-holder for making laterally-variable pivotal connection with said projection, and means for adjustably and pivotally connecting the coupling device to a part of a stretching mechanism, substantially as set forth.

4. The combination with a stretcher-head, of a series of leather-holders having projections in rear of their leather-engaging means, a corresponding series of coupling devices having means for making laterally-variable pivotal connection with said projections, and means for adjustably and pivotally connecting the coupling devices to the stretcher-head, substantially as set forth.

5. The combination with a stretcher-head having guideways extending parallel with the direction of tension of the machine, of a series of leather-holders having projections in rear of their leather-engaging means, a corresponding series of coupling devices having means for making laterally-variable pivotal connection with said projections and provided with pivotally-connected bodies adapted to be adjustably inserted and retained in said guideways, substantially as set forth.

701,839. ENVELOP. ARTHUR F. GALLAGHER, Chicago, Ill. Filed Dec. 9, 1901. Serial No. 55,117. (No model.)

Claim.—In combination with an envelop having a comparatively opaque face and a display-opening therein having transparent covering, of a folded communication sheet therein, said sheet being so folded with regard to the position of the sender's name and address upon the same side of the sheet with the communication, that only said name and address appear through the display-opening whereby the sender's name and address as a part of the communication serve also as the envelop address.

701,840. WORD-COUNTING ATTACHMENT FOR TYPE-WRITING MACHINES. HENRY A. GARY, Los Angeles, Cal. Filed Oct. 2, 1901. Serial No. 73,622. (No model.)

Claim.—1. A counting attachment for bar type-writing machines, consisting of a main frame carrying suitable registering mechanism, two independent rocking frames pivoted within the main frame and provided with projections for contacting with the key and spacing-bar levers, and means intermediate of the rocking frames and the registering mechanism for operating the latter, substantially as hereinafter set forth.

2. In a word-counting attachment for type-writing machines, a frame adapted to be secured to the type-writing machine and beneath the key-levers thereof, a rocking frame mounted upon a fulcrum and provided in front of its fulcrum with vertical contacts or projections for receiving the impact of the spacing-lever and punctuating key-levers, and with similar contacts or projections in rear of the fulcrum for receiving the impact of the alphabet key-levers, a registering mechanism and means intermediate of said registering mechanism and the rocking frame for transmitting the motion of the rocking frame to the registering mechanism, substantially as and for the purpose set forth.

3. In a counting attachment for type-writing machines, a frame adapted for movement to the type-writing machine, a rocking frame mounted upon a fulcrum within said frame and provided with fingers or projections for contacting with the alphabet key-levers and the spacing-bar and punctuating key-levers, a swinging ball provided with a rocking shaft curved with cam adapted to contact with the numeral and sign key-levers, mechanism intermediate of the rocking frame and also between the

swinging ball and indicator device for operating the indicators and mechanism between the swinging ball and paper-carriage-shifting bar for transmitting the shifting motion of the rocking shaft to the swinging ball, substantially as and for the purpose set forth.

4. In a word-counting attachment for type-writing machines the combination with a suitable frame for attachment to the machine, a rocking frame adapted to contact with predetermined key-levers, and the spacing-bar, a swinging ball provided with a rock-shaft having a crank at one end, and means for contacting with the numeral key-levers in either upper or lower case, a spring for restoring the swinging ball to normal position, mechanism intermediate of the rocking frame and also the swinging ball and the respective indicators for operating the latter, and a vibrating pivoted lever attached to the front of the machine and pivotally connected at one end to a connection with the crank of the rock-shaft of the swinging ball, and at its upper end to an arm connected with the frame of the paper-carriage, substantially as and for the purpose set forth.

5. In a word-counting attachment such as described, the rock-shaft in the swinging ball provided with contact-cams adapted to contact with predetermined numeral key-levers whether in lower or upper case, in combination with means connecting the paper-carriage and the rock-shaft for rotating the rock-shaft, substantially as hereinafter set forth.

6. In a word-counting attachment for type-writing machines, in combination with the frame adapted to be clamped to a machine, a rocking frame provided with contacts for the alphabet key-levers, on one side of its fulcrum, and on the other side with contacts for the spacing-bar and punctuating key-levers, a swinging ball provided with contacts for the numeral key-levers, a knee-lever pivoted to the frame and connecting the rocking frame and an indicator, and a lever-arm pivoted to the frame connecting the rock-shaft of the swinging ball and an indicator, substantially as and for the purpose set forth.

7. In a word-counting attachment such as described, in combination with the crank-arm of the rock-shaft of the swinging ball, the arm 24, the lever 25 adapted to be pivotally connected with a machine, and the arm 26 pivoted at one end to the lever 25, and provided with a boss 30, adapted to pass over the end of the shifting-bar of a paper-carriage, substantially as and for the purpose set forth.

701,841. ROLL FOR PLATING MACHINES. DANIEL L. DEARDEN, Ayr, Mass., assignor to George J. Burns, Ayr, Mass. Filed Sept. 11, 1901. Serial No. 73,641. (No model.)

Claim.—1. A roll comprising a peripheral portion composed of a plurality of independently-movable annular sections, a supporting-shaft,

and independent spring devices interposed between said shaft and peripheral portion and each comprising a trunk portion and a plurality of spring-fingers integral therewith and bearing on a plurality of said sections, the said fingers extending substantially tangential to the shaft.

2. A roll comprising a peripheral portion composed of a plurality of independently-movable annular sections, a supporting-shaft, independent spring devices interposed between said shaft and peripheral portion and each comprising a plate extending longitudinally of the shaft and having a plurality of integral spring-fingers bearing upon a plurality of said sections and independent removable clamping devices detachably securing said plates to the shaft.

3. A roll comprising a peripheral portion composed of a plurality of independently-movable annular sections, and means yieldingly pressing said sections together in an axial direction and adapted to yield to permit their axial expansion.

701,842. ENGINEER'S VALVE. NILES A. CHANDLER, Milwaukee, Wis. Filed Aug. 27, 1900. Serial No. 24,148. (No model.)

Claim.—1. In an engineer's valve the combination of a valve-cam having main-reservoir and train-pipe connections and an exhaust-port, a main valve controlling the supply and release of fluid-pressure to and from the train-pipe, means for manually operating said valve, an automatic feed-valve for restoring and maintaining the desired pressure in the train-pipe when the main valve is in running position, a movable part exposed on one side to train-pipe pressure, a spring acting on said movable part in opposition to the train-pipe pressure, and tending to open said feed-valve, and a port or passage adapted to be opened and to admit pressure to the other side of said movable part when the main valve is in service position, substantially as and for the purpose set forth.

2. In an engineer's valve the combination of a valve-cam having main-reservoir and train-pipe connections and an exhaust-port, a main valve controlling the supply and release of fluid-pressure to and from the train-pipe, means for manually operating said valve, an automatic feed-valve for restoring and maintaining the desired pressure in the train-pipe when the main valve is in running position, a movable part for operating said feed-valve exposed on one side to train-pipe pressure, a spring acting on said movable part in opposition to the train-pipe pressure and tending to open said feed-valve, and means operated by the main-valve-opening means to admit fluid-pressure to the opposite side of said movable part when the main valve is in service position and to release such pressure when the main valve is in running position, substantially as and for the purpose set forth.

3. In an engineer's valve the combination with a main valve directly controlling the supply and release of fluid-pressure to and from the train-pipe, and a handle for operating said valve, of an automatic feed-valve controlling the supply of fluid-pressure to the main valve and adapted to restore and maintain the desired pressure in the train-pipe when the main valve is in running position, a movable part for operating said feed-valve, normally exposed on one side to train-pipe pressure, a spring tending to open said feed-valve and means operated by said handle for admitting pressure to the opposite side of said movable part when the main valve is in position to apply the brakes, substantially as and for the purpose set forth.

4. In an engineer's valve the combination with a main valve di-

rectly controlling the supply and release of fluid-pressure to and from the train-pipe and a handle for operating said valve, of an automatic feed-valve for restoring and maintaining the desired pressure in the train-pipe when the main valve is in running position, a movable part for operating said feed-valve normally exposed on one side to train-pipe pressure, and means operated by said handle for admitting pressure to the opposite side of said movable part when the main valve is in a certain position and releasing such pressure when the main valve is in another position, substantially as and for the purposes set forth.

5. In an engineer's valve the combination with a main valve controlling the supply and release of fluid-pressure to and from the train-pipe and a handle for operating said valve, of an automatic feed-valve adapted to restore and maintain the desired pressure in the train-pipe when the main valve is in running position, a movable part normally exposed on one side to train-pipe pressure for operating said feed-valve, a push-pin for manually operating said movable part and opening said feed-valve provided with a valve for closing the opening in the valve-case through which said pin projects, and means operated by said handle for admitting pressure to the opposite side of said movable part and closing the valve on the push-pin when the main valve is in a certain position and releasing such pressure when the main valve is in another position, substantially as and for the purposes set forth.

6. In an engineer's valve the combination with a valve-case having main-reservoir and train-pipe connections and an exhaust-port and a main valve controlling the supply and release of fluid-pressure to and from the train-pipe, of an automatic feed-valve for restoring and maintaining the desired pressure in the train-pipe when the main valve is in running position, a stem for operating said main valve fitted to turn in said case and provided with a movable part which is normally exposed on one side to train-pipe pressure and with a port which is adapted to register with ports in the valve-case and to admit pressure to the other side of said movable part when the main valve is in service position and to gradually release such pressure when the main valve is in running position, and a spring acting on said movable part in a direction tending to open said feed-valve, substantially as and for the purposes set forth.

7. In an engineer's valve the combination with a valve-case having main-reservoir and train-pipe connections and an exhaust-port and a main valve for controlling the supply and release of fluid-pressure to and from the train-pipe, of an automatic feed-valve for restoring and maintaining the desired pressure in the train-pipe when the main valve is in running position, a tabular stem for operating said main valve, fitted to turn in said case and provided with a movable part which is normally exposed on one side to train-pipe pressure and with a port which is adapted to register with ports in the valve-case and to admit pressure to the other side of said movable part when the main valve is in service position and to gradually release such pressure when the main valve is in running position, a spring acting on said movable part in a direction tending to open said feed-valve, and a push-pin for manually operating said movable part and opening said feed-valve, provided with a valve which is adapted to close the opening through which said pin passes when pressure is admitted into said tabular stem, substantially as and for the purposes set forth.

701,843. AUTOMATIC CONTROLLER FOR ELECTRIC MOTORS.
STIM A. CHRISTENSEN, Milwaukee, Wis. Filed Oct. 31, 1901. Serial No. 79,398. (No model.)

Claim.—1. In an automatic controller the combination of two magnets having a common core or plunger movable axially therein, a spring-actuated arm mounted upon said plunger and provided with a contact-piece, and an opposing contact-piece arranged in the path of the movable contact-piece, substantially as described.

2. In an automatic controller the combination of two magnets having a common core or plunger movable axially therein, a contact-piece mounted upon said plunger and movable with said plunger, and an opposing contact-piece yieldingly mounted upon a fixed support in the path of said movable contact-piece, substantially as described.

3. In an automatic controller the combination of two magnets arranged in line with each other and having a common core or plunger movable axially therein, a spring-arm mounted upon said plunger and

provided with a contact-piece, and a spring-arm mounted on a fixed support and provided with a contact-piece in the path of the contact-piece carried by said plunger, substantially as described.

4. In an automatic controller the combination of two solenoid-magnets having a common core or plunger movable axially therein, an insulated arm mounted upon said plunger and provided with a contact-piece, a stationary electric conducting guide or slip with which said arm has a sliding contact, and a contact-piece arranged in the path of the contact-piece on said arm, substantially as described.

5. In an automatic controller the combination of two solenoid-magnets arranged in line with each other and having a common plunger movable axially therein, an insulated spring-arm mounted on said plunger approximately parallel therewith and provided with a contact-piece, another insulated contact-piece arranged in the path of the contact-piece on said spring-arm, and a switch controlling the circuit of said magnets and having a fluid-actuating connection, substantially as described.

6. In an automatic controller the combination of two solenoid-magnets arranged in line with each other and having a common plunger movable axially therein, an insulated spring-arm mounted on said plunger and provided with a contact-piece, a stationary guide or slip with which said arm has a sliding contact, and with which one terminal of an electric circuit is connected, an insulated spring-arm mounted on a stationary support and provided in the path of the first contact-piece with another contact-piece with which the other terminal of said circuit is connected, and a switch controlling the circuit of said magnets and having a fluid-actuating connection, substantially as described.

7. In an automatic controller the combination of two solenoid-magnets having a common plunger movable axially therein, a main switch having a contact-piece mounted on and movable with said plunger, and another contact-piece arranged in the path of said movable contact-piece, a primary switch controlling the circuit of said magnets, and a circuit-breaker mounted on said plunger and adapted to open the circuit through the switch-opening magnet when the main-switch contact-pieces are separated, substantially as described.

8. In an automatic controller the combination of two solenoid-magnets arranged in line with each other and having a common plunger movable axially therein, a main switch having contact-pieces one of which is mounted upon said plunger and movable therewith into and out of engagement with the other, a primary switch having minimum and maximum pressure contact-pieces and a fluid-pressure-actuated contact-piece for controlling the circuit of said magnets, normally-engaged springs in the circuit of the switch-opening magnet, and a circuit-breaker carried by said plunger and adapted to separate said springs when the main switch is opened, substantially as described.

9. In an automatic controller the combination of two magnets arranged in line with each other and having a common core or plunger movable axially therein, a switch having a contact-piece mounted on said plunger and another contact-piece in the path of said movable contact-piece, and a blow-out magnet arranged in circuit with said contact-pieces and having one of its poles in proximity with the stationary contact-piece, substantially as described.

701,844. WHEEL ATTACHMENT FOR CULTIVATORS.
WILLIAM F. CLAFF, North Rush, N. Y. Filed Dec. 14, 1901. Serial No. 83,912. (No model.)

Claim.—1. The combination with a cultivator of a wheel; a support for the wheel, adapted to carry the wheel on either side of the cultivator, and means whereby the wheel is caused to assume its operative position on either side of the cultivator.

2. The combination with a cultivator of a wheel; a support for the wheel adapted to carry the wheel on either side of the cultivator; and means for attaching the wheel to its support, whereby the wheel is caused to assume its operative position on either side of the cultivator.

3. The combination with a cultivator of a wheel; a support for the wheel adapted to carry the wheel on either side of the cultivator; means whereby the wheel is caused to assume its operative position on either side of the cultivator; and means for transferring the wheel from one side of the cultivator to the other.

4. The combination with a cultivator of a wheel; a support for the wheel on one side of the cultivator and movably attached thereto; means for attaching the wheel to its support, whereby the wheel is adapted to assume its operative position on either side of the cultivator; and means for moving the support from one side of the cultivator to the other.

5. The combination with a cultivator of a wheel; a support for the wheel adapted to carry the wheel on either side of the cultivator; and means for pivotingly attaching the wheel to its support, whereby the weight of the wheel will cause it to assume automatically its operative position when the support is on either side of the cultivator.

6. The combination with a cultivator of a wheel; a support for the wheel, adapted to transfer the wheel from one side of the cultivator to the other; means for pivotingly attaching the wheel to the support; and means for connecting the wheel with the cultivator, whereby said wheel is caused to assume an operative position on either side of the cultivator.

7. The combination with a cultivator of a wheel; a support for the wheel, adapted to transfer the wheel from one side of the cultivator to the other; means for pivotingly attaching the wheel to its support, whereby its own weight will cause it to assume an operative position on either side of the cultivator; and means for connecting the wheel with the cultivator, whereby said wheel is caused positively to assume an operative position on either side of the cultivator.

8. The combination with a cultivator of a wheel; the arm K revolvably attached to the cultivator; means for pivotingly attaching the wheel to the arm K whereby the wheel is caused to assume automatically an operative position on either side of said cultivator; and means for transferring the arm K from one side of the cultivator to the other.

9. The combination with a cultivator of a wheel; the arm K revolvably attached to the cultivator; a support for the wheel revolvably secured to the arm K; and means for connecting said support with the cultivator, whereby the wheel is caused to assume an operative position on either side of the cultivator.

10. The combination with a cultivator of a wheel; the arm K revolvably attached to the cultivator; the sprocket-wheel I pivotally attached thereto; means for connecting the wheel with the sprocket-wheel I; the sprocket-wheel M, rigidly secured to a part of the cultivator; and the chain L connecting said sprocket-wheels.

11. The combination with a cultivator of a wheel; the arm K, revolvably attached to the cultivator; the sprocket-wheel I, pivotally attached thereto; means for connecting the wheel with the sprocket-wheel I; the sprocket-wheel M, rigidly secured to a part of the cultivator; the chain L, connecting said sprocket-wheels; and means for transferring the wheel from one side of the cultivator to the other.

12. The combination with a cultivator of a wheel; the arm K, revolvably attached to the cultivator; the sprocket-wheel I, pivotally attached thereto; means for connecting the wheel with the sprocket-wheel I; the sprocket-wheel M, rigidly secured to a part of the cultivator; the chain L, connecting said sprocket-wheels; the rod K, revolvably supported upon the cultivator; and a sliding connection between the arm K and said rod K.

13. The combination with a cultivator having the central beam A' of a wheel; the revolvable arm K supported by said central beam A'; means for pivotingly connecting the wheel to the arm K; and means for transferring the wheel from one side of the cultivator to the other.

701,845. SHIPPING-PACKAGE. FRANK W. COLLIER, Eastford, Me. Filed Nov. 4, 1901. Serial No. 81,380. (No model.)

Claim.—1. A shipping-package comprising an inner and an outer casing spaced apart to form an air-compartment which entirely surrounds the sides and top of said inner casing, said compartment communicating with the inner casing at its upper and lower ends, whereby a cold-air circulation is maintained through the inner casing and air-compartment, the outer casing being provided with a waste-drip in its bottom, substantially as set forth.

2. A shipping-package comprising an inner and an outer casing spaced apart to form an air-compartment which entirely surrounds the sides and top of said inner casing, said compartment communicating with the inner casing at its upper and lower ends, whereby a cold-air circulation is maintained through the inner casing and air-compartment, the outer casing being provided with a waste-drip in its bottom, substantially as set forth.

701,846. BARR-GUTTER FOR TREEMING-MACHINES.
F. CUMBER, Fort Haven, Mich. Filed July 12, 1901. Serial No. 86,418. (No model.)

Claim.—The combination with the thrasher-frame, the thrasher-rotator and shaft, and the handle-thrower, of a drive-shaft mounted in the frame and in gear with said thrasher-shaft, a frame connected to swing upon the drive-shaft, a crank-shaft journaled in the swinging frame, gearing between the drive and crank shafts, crank-arms mounted intermediate upon the crank-shaft, V-shaped band-cutting and spreading devices provided with cutting-knives and carried by the lower ends of said crank-arms, links connecting the upper ends of the crank-arms to the thrasher-frame to control the action of said arms to swing said cutting and spreading devices in an elliptical path whose major axis lies parallel with the path of travel of the straw, and cushioning-stops upon the frame to take up the jar of impact upon the downward movement of the frame, thereby relieving the parts from strain, substantially as set forth.

701,847. INSULATOR. VERNER S. CONVERSE, Pittsburgh, Pa. Filed Aug. 2, 1901. Serial No. 78,574. (No model.)

Claim.—1. An insulator for currents of high voltage, consisting of separable sections, the number employed dependent upon the amount of insulation required, and means for holding the sections assembled against any force applied.

2. An insulator for currents of high voltage, having extreme sections and one or more separable mean sections, the number of the latter employed dependent upon the amount of insulation required and means for holding the sections assembled against any force applied.

3. An insulator for currents of high voltage including in its composition separable insulating-sections with outwardly-extending flanges, a gap being between the flanges of adjacent sections and beyond the flange of an extreme one of said sections, and means for holding the sections assembled against any force applied.

4. A high-voltage insulator made up of three or more parts which are separate articles of manufacture, one of which acts as a cap to cover or protect the pin or support from the elements, the second a tube or cylinder of a smaller diameter than the first part which surrounds or encloses the pin and electrically protects it, and the third one or more parts with outwardly-extending flanges or pot-heads which intervene between the first and second parts.

5. A high-voltage insulator made up of three or more parts which are separate articles of manufacture, one of which acts as a cap to cover or protect the pin or support from the elements and has a downwardly-extending flange or petticoat, the second a tube or cylinder of a smaller diameter than the first part which surrounds or incloses the pin and has an upwardly-extending groove which will hold oil or other insulating material, the third one or more parts with outwardly-extending flanges or petticoats which intervene between the first and second parts and have downwardly-extending flanges or petticoats, and upwardly-extending grooves which hold oil or other insulating material.

701,848. INSULATOR. VERNON G. CONVERSE, Pittsburg, Pa. Filed Mar. 17, 1902. Serial No. 94,962. (No model.)

Claim.—1. An insulator for currents of high voltage, consisting of sections separate in manufacture, the number employed dependent upon the amount of insulation required, and means for holding the sections permanently assembled against any force applied.

2. An insulator for currents of high voltage, having extreme sections and one or more mean sections separate in manufacture, the number of the latter employed dependent upon the amount of insulation required and means for holding the sections permanently assembled against any force applied.

3. An insulator for currents of high voltage including in its organization insulating sections separate in manufacture and with outwardly-extending flanges, a gap being between the flanges of adjacent sections and beyond the flange of an extreme one of said sections, and means for holding the sections permanently assembled against any force applied.

4. A high-voltage insulator made up of three or more parts which are separate articles of manufacture, one of which acts as a cap to cover or protect the pin or support from the elements, the second a tube or cylinder of a smaller diameter than the first part which surrounds or incloses the pin and electrically protects it, and the third one or more parts with outwardly-extending flanges or petticoats which intervene between the first and second parts, the said parts being permanently united for use.

5. A high-voltage insulator made up of three or more parts which are separate articles of manufacture, one of which acts as a cap to cover or protect the pin or support from the elements and has a downwardly-extending flange or petticoat, the second a tube or cylinder of a smaller diameter than the first part which surrounds or incloses the pin and has an upwardly-extending groove, the third one or more parts with outwardly-extending flanges or petticoats which intervene between the first and second parts and have downwardly-extending flanges or petticoats, and upwardly-extending grooves, the said parts being permanently united for use.

701,849. CONCRETE RAIL-JOINT AND TIE-PLATE. THOMAS OGDON, Kansas City, Mo. Filed Oct. 2, 1901. Serial No. 77,966 (No model.)

Claim.—A rail-joint comprising a tie-plate provided with recesses, a chair having projections entering said recesses, to prevent relative move-

ment therebetween, a longitudinal groove in the top of the chair, the rails having their bases cut away at the ends and the ends of their webs mounted in said groove, and bolts passing through the webs and the chair; substantially as described.

701,850. EXTENSION-CYLINDER FOR PIN-LOCKER. ALEXANDER GRAMMER, Lyons, Iowa. Filed Jan. 14, 1902. Serial No. 95,004 (No model.)

Claim.—1. In a lock, the combination with a shell, a cam mounted thereon, and operating-rods secured to the cam, of a block having a key-plate adjustably engaging the rods, and an adjustable connection between the shell and block.

2. In a lock, the combination with a threaded shell provided with a series of holes, a cam mounted on the shell, and operating-rods secured to the cam, of a block having a key-plate adjustably engaging the rods, and a spring-pressed pin on the block adapted to enter the holes in the shell.

3. In a lock, the combination with a threaded shell provided with a series of perforations, a cam mounted thereon, and operating-rods secured to the cam, of a block adapted to the shell, a spring-pin on the block adapted to the perforations of the shell, and a key-plate in the block provided with longitudinal holes to receive the rods.

4. In a lock-cylinder the combination with a cup-shaped shell having interior ribs, and a cam mounted on the cap of the shell, of a block having grooves or channels adapted to receive the ribs, a key-plate within the block, extendible connections between the plug and cam, and extendible connections between the shell and block.

5. In a cylinder for locks, the combination with a shell having a series of holes in its wall and a perforation in its rear plate, a connecting washer in the perforation, a cam in the rear of the plate, and shoulder connecting-rods in the shell passing through the washer and stem and being headed to secure the parts together, of a block having a pin-chamber, a rotating key-plate normally communicating therewith and having longitudinal holes to receive the rods, and a spring-pressed pin on the rear of the block adapted to the holes in the shell-wall.

701,851. ORE SEPARATOR AND CLASSIFIER. CHARLES CULVER, London, Canada. Filed July 4, 1901. Serial No. 67,577. (No model.)

Claim.—1. An ore-classifier comprising a cone-shaped hopper forming a settling-chamber, an inflow-conduit leading into the top thereof, a secondary cone-shaped hopper forming an sorting-chamber and having its wide mouth attached to the reduced lower end of the main hopper, a pipe having a branch adapted to form a means for an upward current of water through said hoppers, one or more lines leading from the upper end of said second hopper upwardly, and a trough surrounding the upper end of the main hopper into which said lines debouch.

2. An ore-classifier comprising a cone-shaped hopper forming a settling-chamber, an inflow-conduit leading into the top thereof, a secondary cone-shaped hopper forming an sorting-chamber and having its wide mouth attached to the reduced lower end of the main hopper, a pipe having a branch adapted to form a means for an upward current of water through said hoppers, one or more lines leading from the upper end of said second hopper upwardly, a trough surrounding the upper end of the main hopper into which said lines debouch, and a baffle-plate comprising a vertical dam portion extending from side to side of the main hopper, across the open top thereof, and a horizontal portion extending toward said inflow-conduit, whereby to check the disturbance caused by the inflow of water.

701,852. ACETYLENE-GAS GENERATOR. AUGUSTUS DAVIS, Chicago, Ill. Filed Jan. 21, 1902. Serial No. 95,971. (No model.)

Claim.—1. In a gas-generator, the combination, with a generator-chamber, of a cylinder revolvably supported therein at both ends, provided with a ferrous body and a hollow axle and adapted to contain the carbide or other solid, a fixed or stationary perforated pipe or sprinkler located within the upper portion of the cylinder, and a water-supply pipe connected thereto and extending through the hollow axle of the cylinder to the exterior of the chamber, substantially as described.

2. In a gas-generator, the combination, with a generator-chamber, of a revolvable cylinder therein adapted to contain the carbide or other solid, and having a ferrous body, and a coil of pipe externally surrounding said body, connected to suitable water supply and discharge pipes and supporting and rotating along with the ferrous body, substantially as described.

3. In a gas-generator, the combination, with a generator-chamber, of a revolvable cylinder therein adapted to contain the carbide or other solid and comprising terminal heads and connecting-rods, a ferrous body of wire-netting or the like, and a coil of pipe surrounding and rotating along with said ferrous body and having suitable supply and discharge connections for a cooling medium such as water, substantially as described.

4. In a gas-generator, the combination, with a generator-chamber provided with a water-jacket, of a revolvable carbide-cylinder within said chamber provided with a surrounding cooling-coil, means for supplying water to the carbide in the cylinder, and means for simultaneously supplying water to the water-jacket and cooling-coil, substantially as described.

5. In a gas-generator, the combination, with a generator-chamber to contain the carbide or other solid and cooling device for said generator-chamber, of means controlled by the volume of gas generated for simultaneously supplying water to the carbide and to the cooling device, substantially as described.

6. In a gas-generator, the combination, with a generator-chamber, of a revolvable carbide-cylinder therein having a ferrous body, an inclined trough or receptacle in said chamber below said cylinder, a conveyor located in said trough or receptacle, a residuum-discharge opening at the upper end of said trough or receptacle, and a water-discharge opening at the lower end thereof, substantially as described.

7. In a gas-generator, the combination, with a generator-chamber, of a revolvable carbide-cylinder therein having a ferrous body, an inclined trough or receptacle in said chamber below said cylinder, a conveyor located in said trough or receptacle, a residuum-discharge opening at the upper end of said trough or receptacle, a water-discharge opening at the lower end thereof, and a water-supply pipe discharging into the upper end of said trough or receptacle, substantially as described.

8. In a generator of the character described, the combination, with a generator-chamber having a residuum-discharge pipe provided with a cover having a depending annular flange, of a residuum-receptacle provided with an annular water seal to receive said flange, and means for raising and lowering and supporting in a raised position said receptacle, substantially as described.

9. In a gas-generator of the character described, the combination, with a generator-chamber having a residuum-discharge pipe provided with a cover having a depending annular flange, of a residuum-receptacle provided with an annular water seal to receive said flange, and a lever

provided with a yoke to engage said receptacle and with means whereby said lever may be locked, substantially as described.

10. In a gas-generator of the character described, the combination, with a generator-chamber having an inclined bottom, a conveyor therein, and a water-supply pipe, of a water-discharge pipe, and a liquid-receptacle into which said discharge-pipe opens below the water-level, said liquid-receptacle being connected to a suitable discharge-pipe and provided with a water-sealed cover, substantially as described.

701,853. GEOGRAPHICAL TIMEPIECE. CHARLES E. DAVIS, New York, N. Y., assignor of one-third to Henry D. Hartman, New York, N. Y. Filed Feb. 12, 1901. Serial No. 47,596. (No model.)

Claim.—1. In a geographical timepiece, the combination with two fixed disks upon opposite faces thereof, one of said disks divided off into the twelve hours of the day or night, and the other of said disks divided off into the twenty-four hours of the day and night, of hour and minute hands for the twelve-hour dial, driving mechanism for driving the same, a geographical disk arranged to rotate in proximity to said twenty-four-hour dial, and a revolving gear-chain driven from the driving mechanism of the hands of the twelve-hour dial and driving said geographical disk adapted to drive the same at half the speed of the hour-hand of the twelve-hour dial, and composed entirely of continuous spur-gears whereby it is adapted to transmit motion continuously from said driving mechanism to the geographical disk, and to rotate the same in the opposite direction to the hands of the twelve-hour dial.

2. In a geographical timepiece, the combination with two fixed disks upon opposite faces thereof, of a minute-spindle, a pinion secured to rotate therewith, a pinion loosely mounted upon said minute-spindle, two intermediate gear-wheels secured to rotate together, one of said intermediate gear-wheels meshing with one of said pinions, an idler gear-wheel, independently mounted, and meshing with the other said pinion and with the other intermediate gear-wheel, the ratio of said gearing being such that the two said pinions rotate at the same rate of speed with respect to a fixed point, but in opposite directions to each other, and a hand secured to rotate with each said pinion, one in proximity to the said dial on one face of the timepiece and the other in proximity to the said dial on the opposite face thereof.

3. In a geographical timepiece, the combination with two fixed disks upon opposite faces thereof, one of the said disks divided off into the twelve hours of the day or night, and the other of the said disks divided off into the twenty-four hours of the day and night, of a minute-spindle adapted to make one revolution per hour, in a direction from left to right with respect to the twelve-hour dial, a pinion-rod secured to rotate in proximity to the said twelve-hour dial, an hour-dial mounted on said minute-spindle and geared to rotate therewith at a rate of one to twelve therewith, an hour-hand mounted on said hour-dial, a pinion secured to said minute-spindle, a pinion loosely mounted upon said minute-spindle, two intermediate gear-wheels secured to rotate together, one of said intermediate gear-wheels meshing with one of said pinions, an idler gear-wheel, independently mounted, and meshing with the other said pinion and with the other said intermediate gear-wheel, the ratio of said gearing being such that the two said pinions rotate at the same rate of speed with respect to a fixed point, but in opposite directions to each other, a minute-hand secured to rotate with the pinion which is loosely mounted upon the said minute-spindle, and in proximity to the said twenty-four-hour dial, another hour-dial loosely mounted upon the axle of the minute-spindle, and geared to rotate with respect to the last-mentioned pinion at the rate of one to twenty-four, and a geographical disk, having various location denoted thereon, secured to rotate with said last-mentioned hour-dial, and in proximity to the said twenty-four-hour dial.

701,854. RIDING-SCUR. CHARLES W. DAVIES, Philadelphia, Pa. Filed Aug. 19, 1901. Serial No. 72,599. (No model.)

Claim.—A yoke comprising a single piece of spring metal and provided with a plurality of studs, a riding-scur carried by said yoke; in combination with the heel of a boot or shoe having chambers, circularly-saw-threaded plugs occupying the outer portions of the chambers and serving as seats to receive said studs, a plunger slidably mounted in each plug and having headed ends, the inner headed end of the plunger extending through

the inner end of the plug and occupying the inner portion of the plug-chamber and adapted to abut against said plug to limit the outward movement of the plunger, and a spring in the plug between the inner end of the plug and the outer beveled end of the plunger, and adapted, when the studs are removed, to force the plunger outward to close the plug-chamber, substantially in the manner set forth.

701,855. LUBRICATING ATTACHMENT FOR CAR-AXLES. Geo. W. DUNN, Scranton, Pa. Filed Aug. 9, 1904. Serial No. 71,472. (No model.)

Claim.—A car-axle-lubricating attachment comprised in an axle-box proper with a free open end, a lubricant-receptacle removably secured within the walls of said box, suitable supporting-springs arranged on the bottom of said receptacle, a take-up roller mounted within said lubricant-receptacle, and arranged to parallel the journal to be lubricated and to be contact therewith, in combination with means for revolving said take-up roller, substantially as specified.

701,856. FEAT-PRESS. ARTHUR A. DUNN, Toronto, Can. Filed June 24, 1901. Serial No. 85,571. (No model.)

Claim.—1. In a feat-compressing machine, a piston or plunger, a die-block, a supplemental plunger carried by the die-block and adapted

to act as an ejector, the said plunger being actuated by the main compressing power through the said block being formed, the die-block being fixed in its relation to the main piston in the ordinary action of the machine and adapted to yield bodily to any excess of pressure beyond a predetermined limit.

2. A compressing-machine comprising one part having a die-cavity for the reception of the material to be compressed and a second part consisting of a plunger or piston operating to compress said material within the die-cavity and yielding means adapted to give only on an excess of pressure beyond a predetermined limit, the compressed material being held intact and unbroken at all times.

701,857. MOTOR. WILLIAM DUNN, Brooklyn, N. Y., and HARRY O'NEILL, Chicago, Ill.; said O'NEILL assignor of his right to Irving A. O'Hara, Brooklyn, N. Y. Filed Feb. 20, 1901. Serial No. 68,178. (No model.)

Claim.—In an engine of the character described, a steam-motor, an explosive-motor, operative connected, a steam-jacket interposed between the cylinders of said motors, a piston movable in the cylinder of the steam-motor, a plunger movable in the combustion-chamber of the explosive-motor, and a piston-rod carrying said piston and plunger and movable through said steam-jacket, substantially as shown and described.

701,858. TRACE-CARRIER. WILLIAM E. DUFFY, Des Moines, Iowa. Filed Mar. 20, 1908. Serial No. 708,778. (No model.)

Claim.—A trace-carrier comprising a single imperforate base-ring, a single curved bar extending across the center of the ring with its ends integral with the inner portion of said ring, said cross-bar provided on opposite sides at its center with a downwardly-extending straight arm the ends of which terminate beyond the side of the said curved bar and below the plane of the upper portion of the base-ring, substantially as shown and described.

701,859. ORE-CONCENTRATOR. WILLIAM S. DUNN, San Francisco, Cal. Filed Feb. 3, 1902. Serial No. 82,328. (No model.)

Claim.—1. An ore-concentrator comprising an inclined circular table having an unrifled or plain portion adjacent its discharge for the removal of a series of curved rifled plates extending from approximately a radial division of the table onto the plain or unrifled portion thereof, means for

imparting an oscillatory motion to the table, and an inclined launder or trough attached to and carried by the table, said launder or trough arranged to receive the middlings from the table and to discharge same thereon for reworking.

2. An ore-concentrator comprising an inclined circular table having an unrifled or plain portion adjacent its discharge for the removal of a series of curved collecting-rifles arranged on the working face thereof and discharging onto the plain or unrifled portion of said table, means for imparting an oscillatory motion to the table, and a valve-controlled return launder or trough attached to and carried by the table, said launder or trough arranged to receive the middlings discharged from the table and to return the same thereto at its head.

3. The combination with an inclined circular concentrating-table, a series of curved rifled plates arranged on the working face thereof, means for imparting an oscillatory motion to the table, and an inclined launder or trough attached to and carried by the table, said launder or trough arranged to receive the middlings from the table and to discharge same thereon for reworking.

4. A circular concentrating-table comprising a body portion composed of a series of adjustable pieces, a cover therefor, a series of curved rifled plates arranged thereon and discharging onto a plain or unrifled portion of the table, and means for imparting vertical adjustment to the pieces composing the body portion of the table.

5. The combination with an inclined circular concentrating-table, of a series of curved rifled plates on the working surface thereof, the terminals of said rifled plates extending and discharging onto a plain or unrifled portion of the table, and means whereby the inclination of the table may be increased or decreased.

6. The combination with an oscillatory inclined circular concentrating-table having a plain or unrifled portion, of a series of curved rifled plates arranged on the working face thereof and discharging onto the plain or unrifled portion, the rifled plates having increasing terminals, and means for increasing or decreasing the inclination of the table.

701,860. OXIDIZING APPARATUS. ALEXANDER H. DUNN, Philadelphia, Pa. Filed Mar. 12, 1908. Serial No. 82,891. (No model.)

Claim.—1. In an apparatus for oxidizing dyed material, the combination with an inclosing compartment; of a pervious, revolvable drum or cylinder, and air-flooding means arranged therein, an alarm for indicating when the temperature within the compartment reaches a predetermined point, said device comprising a thermometer arranged within said compartment and provided with a plurality of contacts; a bell, battery and switchboard arranged upon the exterior of the compartment, said switchboard having contacts, and a controlling-switch, and wires extending to the exterior through the wall of the compartment and connected to the contacts of the thermometer with the bell, battery and contacts of the switchboard, together with a ventilator for allowing the heat to escape from the compartment, substantially as described.

2. In an oxidizing apparatus, an inclosing structure containing a revolvable pervious drum, means for heating the air upon the interior of said structure to the exclusion of outside air, means for sealing said structure and enclosing and admitting air to the interior of said structure and regulating the discharge of heat therefrom, a thermometer within the inclosing structure, an indicator on the exterior, electrical connections between the thermometer and indicator, and an adjustable controlling device in circuit with the thermometer, indicator and connections for regulating the passage of an electrical current to adapt the indicator to sound at different predetermined temperatures, whereby the indicating means may be adjusted from without while the chamber is sealed, so that when the temperature reaches a given point the sealing means may be opened to admit air to, and allow heat to discharge from, the inclosing structure, substantially as described.

701,860

701,861. GAS-FURNACE FOR STEAM-BOILERS. EDWARD J. DUFF, Liverpool, England, assignor of one-half to United Alkali Company, Limited, Liverpool, England. Filed July 17, 1901. Serial No. 82,892. (No model.)

Claim.—1. In gas-furnaces, a combustion-chamber having a perforated arch at top and inlet-ports for gas at bottom and inlet-ports for air at each side so arranged that the streams of gas are met and crossed by incoming streams of air proceeding from opposite sides of the streams of gas, a heating-chamber into which the hot gases are discharged from said

combustion-chamber, discharge flue or flues leading from said heating-chamber, and an air-flue of elongated cross-section for supplying fresh air to the air-inlet ports, said flue having its narrow side in contact with and presenting a limited area to the heating-chamber and its wider side in contact with and presenting a larger area to the discharge flue or flues, whereby the maximum heat may be derived from the hot gases leaving the heating-chamber through the discharge flue or flues for preheating the air and the heat heat extracted from the heating-chamber, substantially as described.

2. In gas-furnaces, a combustion-chamber small at bottom and having a perforated arch at top, and gas-inlet ports at bottom and inlet-ports for air at each side so arranged that the streams of gas are met and crossed by incoming streams of air proceeding from opposite sides of the streams of gas, a heating-chamber into which the hot gases are discharged from said combustion-chamber, discharge flue or flues leading from said heating-chamber, and an air-flue of elongated cross-section for supplying fresh air to the air-inlet ports, said flue having its narrow side in contact with and presenting a limited area to the heating-chamber and its wider side in contact with and presenting a larger area to the discharge flue or flues, whereby the maximum heat may be derived from the hot gases leaving the heating-chamber through the discharge flue or flues for preheating the air and the heat heat extracted from the heating-chamber, substantially as described.

701,862. SEWING-MACHINE. ARTHUR W. HAYES, Boston, Mass., assignor to the Universal Sewing Machine Company, Paterson, N. J., a Corporation of New Jersey. Filed Aug. 9, 1900. Serial No. 96,396. (No model.)

Claim.—1. A sewing-machine, having, in combination, a needle, a needle-guide, mechanism for positively actuating the guide to advance toward the work, means for disconnecting the guide from such mechanism at the end of its positive movement permitting a forward movement of the needle with relation to the guide, and means for actuating the needle, substantially as described.

2. A sewing-machine, having, in combination, a needle, a needle-carrier, a needle-guide, connections between the guide and carrier for positively actuating the needle-guide, means for disconnecting said connections during the forward movement of the needle-carrier permitting a forward movement of the needle with relation to the guide, and means for actuating the needle-carrier, substantially as described.

3. A sewing-machine, having, in combination, a curved needle, a needle-segment, a needle-guide, a pawl pivoted to the needle-segment and engaging the needle-guide, a cam acting to disengage the pawl during the forward movement of the needle-segment, and means for actuating the needle-segment, substantially as described.

4. A sewing-machine, having, in combination, a needle, a needle-guide, mechanism for positively actuating the guide in both directions, means for disconnecting the guide from its actuating mechanism at the end of its positive forward movement permitting a forward movement of the needle with relation to the guide, and means for actuating the needle, substantially as described.

5. A sewing-machine, having, in combination, a needle, a needle-carrier, a needle-guide, connections between the guide and carrier for positively actuating the needle-guide to advance toward the work and thereupon permitting a forward movement of the needle with relation to the guide, and means for actuating the needle-carrier, substantially as described.

701,868. BINOCULAR GLASSES. CORTLAND PRINCE, Cleveland, Ohio, assignor to the Warner and Swasey Company, Cleveland, Ohio, a Corporation of Ohio. Filed Oct. 24, 1901. Serial No. 79,700. (No model.)

Claim.—1. A binocular glass composed of two barrels side by side and adjustably connected together, and two cap-plates secured to the objective ends of said barrels, said cap-plates projecting beyond the outer surface of their respective barrels and being there perforated to form strap-eyes, and guides for the straps secured respectively to said barrels and lying vertically over the said strap-eyes, substantially as and for the purpose specified.

2. A binocular glass composed of two barrels side by side and adjustably connected together, and four cap-plates secured respectively to the two ends of said two barrels, said four cap-plates being perforated beyond the sides of their respective barrels, substantially as and for the purpose specified.

3. A binocular glass composed of two connected members, each including a barrel having in its outer surface a longitudinal depression, and two cap-plates secured respectively to opposite ends of said barrel and having integral perforated extensions in alignment with said depression, substantially as and for the purpose specified.

701,864. FEEDING DEVICE FOR BEAN-SORTING MACHINES. ALBERT T. FRERELL, Saginaw, Mich. Filed May 24, 1901. Serial No. 81,715. (No model.)

Claim.—1. In a feeding device of the class described, a box located between the apron and the hopper and carrying a slidably-adjustable inclined gate; a reciprocating plate having a flange which is interrupted in its length to form a space for the lower edge of the inclined gate and having at its sides laterally-extending supporting-flanges; a wheel carrying ratchet-teeth; an arm or pawl attached to the plate and overriding the teeth; and a spring for holding the arm normally in contact with the teeth.

2. In a feeding device for sorting-machines, a reciprocating inclined feeding-plate having a flange which is interrupted in its length to form a space for the lower edge of the inclined gate, for the purpose set forth.

701,865. BRUSH ATTACHMENT FOR GRAIN-CLEANING MACHINES. ALBERT T. FRERELL, Saginaw, Mich. Filed May 24, 1901. Serial No. 81,716. (No model.)

Claim.—1. A screen-cleaning device comprising in combination: a brush-carrying bracket slidably mounted on a shaft in proximity to the screen; an eccentric-carrying bracket at each end of the shaft; an eccentric revolvably mounted in each of said brackets and supporting the shaft whereby the shaft and bracket can be adjusted toward or from the screen; a reciprocating block movable between guides; cords connecting the brush-carrying bracket with said block; sprocket-wheels near the extremities of travel of the block; a sprocket-chain on said wheels, carrying a laterally-projecting finger engaging a vertical slot in said block to traverse it along its guides; and means for rotating said sprocket-wheels, substantially as described.

2. In a screen-cleaning device the combination with a shaft parallel with the surface of the screen and having eccentrics near its ends whereby the shaft can be adjusted relatively to the screen; of a brush-carrying

brush slidably mounted on the shaft by means of bearings having packing-boxes, for removing dirt from said shaft; together with means for traversing said brush along said shaft, substantially as described.

3. In a screen-cleaning device, a shaft arranged parallel with the surface of the screen; a brush-carrying bracket slidably mounted on the shaft; eccentrics near the ends of said shaft whereby the shaft can be adjusted relatively to the screen; and means for traversing the brush-carrying bracket back and forth along said shaft.

4. In a screen-cleaning device, the combination with a shaft parallel with the surface of the screen; of eccentrics near its ends whereby the shaft can be adjusted relatively to the screen; of a brush-carrying bracket slidably mounted on the shaft by means of a bearing intermediate its ends which permits a limited rotary motion around the shaft whereby the brush may assume an even bearing throughout its length against the under side of the screen, substantially as described.

701,866. BLAST-REGULATOR FOR GRAIN-CLEANERS. ALBERT T. FERRALL, Saginaw, Mich. Filed May 31, 1901. Serial No. 61,717. (No model.)

Claim.—1. An air or blast device comprising a drum divided into sections; a fan divided into sections operating in the drum-sections; double-leaf valves slidably adjustable between the drum-sections; the leaves of said valves being yieldingly held against the ends of said drum-sections, substantially as described.

2. An air or blast device comprising a drum divided transversely into sections; a fan divided transversely into sections operating in the drum-sections; valves slidably adjustable between the drum-sections; said valves being yieldingly held against the ends of said drum-sections, substantially as described.

701,867. WRITING ATTACHMENT. JOHN C. FINE, Steelton, Pa. Filed Feb. 3, 1901. Serial No. 46,122. (No model.)

Claim.—1. In a device of the character described, a receptacle, and a partition forming an ink-well inclosure within said receptacle comprising a sheet of metal bent to form a front and sides and secured to the bottom and sides of the receptacle, one end of said partition being bent around to form a pen-wiper inclosure connected to the end of said ink-well inclosure and forming a partition between the two inclosures, substantially as described.

2. In a device of the character described, a receptacle having a cover hinged thereto, a partition within the receptacle forming an inclosure for an ink-well, one end of said partition being bent around to form a pen-wiper inclosure connected to the end of said ink-well inclosure and forming a partition between the two inclosures, lugs projecting from the inside of the cover and arranged to support pen-holder, lugs also projecting from the inside of the cover and holding a closure or stopper for the ink-well contained in one of said inclosures, and means for holding said cover shut,

whereby the said cover, when closed, supports the pen-holder and holds the ink-well closure or stopper against the mouth of the ink-well, substantially as described.

701,868. TILTING GATE. DEVLIN A. FINNEY, Hamilton, Mont. Filed July 18, 1901. Serial No. 63,464. (No model.)

Claim.—In a tilting gate the combination of inclined lever-supports, bearing-posts, braces connecting said supports and posts, a roller journaled in said posts, a gate carried by said roller, stays connected to said roller upon each side of the gate having their upper ends connected to the gate, chains connected to said stays and to the gate, coupling or lifting rods connected to the said chains, levers pivoted in the upper ends of said inclined supports and connected to the said lifting-rods, supports connected by a bolt between the rails at the lower ends of the gate, a weight carried by the free ends of said supports, checks carried by the roller, and a stop upon each side of the gate adapted to be engaged by the lower ends of the supports which also contact with the checks when the gate is ascending or descending.

701,869. PNEUMATIC-DESPATCH SYSTEM. EDWARD W. FINE-LAND, Chicago, Ill., assignor to the American Pneumatic Service Company, Boston, Mass., a Corporation of Delaware. Filed Sept. 22, 1899. Serial No. 711,690. (No model.)

Claim.—1. In a pneumatic-despatch system, a terminal comprising a main tube and a receptacle adjacent thereto adapted to rotate intermittently and in but one direction across the open end of the main tube, said receptacle having an endwise-rotating carrier-tube section therein which is open at one end and closed at the other, said receptacle being adapted by its intermittent rotation to alternately present the open end or mouth of the carrier-tube section to the main tube and the open air, substantially as described.

2. In a pneumatic-despatch system, a terminal comprising a main tube and a receptacle adjacent thereto adapted to rotate intermittently in a vertical plane and in but one direction across the open end of the main tube, said receptacle having an endwise-rotating carrier-tube section

therein which is open at one end and closed at the other, said receptacle being adapted by its intermittent rotation to alternately present the open end or mouth of the carrier-tube section to the main tube and the open air, and sealing the end of the main tube when the carrier-tube is in the latter position, substantially as described.

3. In a pneumatic-dispatch system, a terminal comprising a main tube having an inclined end portion and a receptacle adjacent thereto adapted to rotate intermittently in a vertical plane and in but one direction across the open end of the main tube, said receptacle having an endwise-rotating similarly-inclined carrier-tube section therein which is open at one end and closed at the other, said receptacle by its intermittent rotation alternately presenting the open end or mouth of the carrier-tube section to the main tube and the open air, substantially as described.

4. In a pneumatic-dispatch system, a terminal comprising a main tube and a rotating receptacle adjacent thereto, having two carrier-tubes arranged oppositely to each other and transversely to the axis of rotation, their outer ends being open and their inner ends closed, one of said carrier-tubes presenting its mouth to the main tube and the other of said carrier-tubes presenting its mouth to the open air, and said receptacle being adapted by a half-revolution to reverse the positions of said carrier-tubes, substantially as described.

5. In a pneumatic-dispatch system, a terminal comprising a main tube, and a receptacle adjacent thereto adapted to rotate in a vertical plane, said receptacle having two parallel carrier-tubes arranged oppositely to each other and transversely to the axis of rotation and having their outer ends open and their inner ends closed, whereby the rotation of the receptacle will alternately present the mouth of each tube to the main tube and to the open air, substantially as described.

6. In a pneumatic-dispatch system, a terminal comprising a main tube having an inclined end portion and a receptacle adjacent thereto and rotating in a vertical plane, said receptacle having two parallel carrier-tubes arranged oppositely to each other and transversely to the axis of rotation, with a normal inclination substantially identical with that of the end of the main tube, the outer ends of said carrier-tubes being open and their inner ends closed, and said tubes being arranged to be successively presented to the main tube and to the outer air, substantially as described.

7. In a pneumatic-dispatch system, a terminal comprising a main tube and a receptacle adjacent thereto adapted to rotate intermittently and in but one direction across the open end of the main tube, an endwise-rotating carrier-tube section open at one end and closed at the other carried by said receptacle, an automatic mechanism for actuating said receptacle when a carrier is introduced into the same so as to alternately carry the open end or mouth of said tube-section into registration with the main tube and the open air, substantially as described.

8. In a pneumatic-dispatch system, a terminal comprising a main tube and a rotating receptacle adjacent thereto, having two parallel carrier-tubes arranged oppositely to each other and transversely to the axis of rotation, their outer ends being open and their inner ends closed, one of said carrier-tubes presenting its mouth to the main tube and the other of said carrier-tubes presenting its mouth to the open air, and means for

imparting a half-revolution to said receptacle to reverse the positions of said carrier-tubes, substantially as described.

9. In a pneumatic-dispatch system, a terminal comprising a main tube and a rotating receptacle adjacent thereto, having two parallel carrier-tubes arranged oppositely to each other and transversely to the axis of rotation, their outer ends being open and their inner ends closed, one of said carrier-tubes presenting its mouth to the main tube and the other of said carrier-tubes presenting its mouth to the open air, and automatic mechanism whereby, upon the advent of a carrier in one of said tubes, a half-revolution will be imparted to said receptacle to reverse the positions of said carrier-tubes, substantially as described.

10. In a pneumatic-dispatch system, a terminal comprising a main tube having an inclined end portion and a receptacle adjacent thereto and rotating in a vertical plane, said receptacle having two parallel carrier-tubes arranged oppositely to each other and transversely to the axis of rotation with a normal inclination substantially identical with that of the end of the main tube, one of said carrier-tubes presenting its mouth to the main tube and the other of said carrier-tubes presenting its mouth to the open air, and means for imparting to said receptacle a half-revolution, whereby the carriers are adapted to enter and leave said receptacle by gravity, substantially as described.

11. In a pneumatic-dispatch system, a terminal comprising a main tube and a rotating receptacle adjacent thereto, having two oppositely-directed transverse carrier-tubes therein, and means for imparting to said receptacle an intermittent rotary motion in a uniform direction of one hundred and eighty degrees, substantially as described.

12. In a pneumatic-dispatch system, a terminal comprising a main tube and a rotating receptacle adjacent thereto, having oppositely-directed transverse carrier-tubes, a motor having mechanism to impart an intermittent rotary motion of one hundred and eighty degrees in a uniform direction to said receptacle, and means actuated by the advent of a carrier in said receptacle for controlling said motor, substantially as described.

13. In a pneumatic-dispatch system, the combination, with a main tube and a rotating receptacle having oppositely-arranged transverse carrier-tubes, of a motor for imparting to said receptacle a half-revolution, automatic mechanism actuated by the carrier for controlling said motor, and means for throwing said automatic mechanism out of operative position, substantially as described.

14. In a pneumatic-dispatch system, the combination, with a main tube and a rotating receptacle having oppositely-arranged transverse carrier-tubes, of a motor for imparting to said receptacle a half-revolution, automatic mechanism actuated by the carrier for controlling said motor, means for throwing said automatic mechanism out of operative position, and means for manually controlling said motor when the automatic mechanism is inoperative, substantially as described.

15. In a pneumatic-dispatch system, the combination, with a main tube and a rotating receptacle having oppositely-arranged transverse carrier-tubes, of a motor for imparting a half-revolution to said receptacle, and means for controlling said motor both automatically by the carrier and manually, substantially as described.

16. In a pneumatic-dispatch system, the combination, with a main tube, of sending and receiving terminals thereof, each comprising a rotating receptacle having oppositely-arranged transverse carrier-tubes, automatic mechanism whereby said receptacles are actuated upon the introduction of a carrier, and mechanism for introducing the carriers into the sending-terminal and removing them from the receiving-chute of the receiving-terminal, substantially as described.

17. In a terminal of the character described, a rotating receptacle secured on an axis, a shouldered disk also secured on said axis, gear loosely mounted on said axis in different planes and having pawls to engage the shouldered disk, each engaging said gear on opposite sides, a motor comprising a cylinder having a piston connected with said racks, and means for controlling said motor, substantially as described.

18. In a terminal of the character described, a rotating receptacle having an axis on which it is secured, a shouldered and flattened disk also secured on said axis, two gear-segments loosely mounted on said axis in different planes and having pawls to engage the shouldered disk, two racks engaging the opposite sides of said segments, cross-bars connecting said racks at top and bottom and adapted to contact with the flat portion of the shouldered disk at the limits of their movement, a motor comprising a cylinder and a piston connected with said racks, and means for controlling said motor, substantially as described.

19. A pneumatic-dispatch terminal comprising a rotary receptacle having oppositely-arranged transverse carrier-tubes therein, each tube being provided at its inner end with a spring-controlled rock-shaft having a stop-arm and an actuating-arm, a motor for actuating said receptacle, a valve controlling said motor, and a lever connected to said controlling-valve and having projections adapted to be successively engaged by the actuating-arms of the carrier-tubes, substantially as described.

20. A pneumatic-dispatch terminal, comprising a rotating receptacle

having oppositely-arranged transverse carrier-tubes, each tube being provided at its inner end with a spring-controlled rock-shaft having a contact-arm adapted to be engaged by the carrier and an actuating-arm, a motor for actuating said receptacle, a valve controlling said motor, a lever connected with said valve and having projections adapted to be respectively engaged by the actuating-arms of the carrier-tubes when said lever is in one position, and a shifting-arm carrying said lever and adapted to shift the same out of operative position, substantially as described.

21. In a pneumatic-dispatch-tube system, the combination, with a main tube, of a rotating receptacle having an annular periphery or rim and transversely-arranged carrier-tubes, a casing inclosing said receptacle and having a tubular extension surrounding the end of the main tube, and a spring-actuating packing located between said tubular extension and the main tube and bearing against the rim of the receptacle, substantially as described.

22. In a pneumatic-dispatch-tube system, the combination, with a main tube, of a rotating receptacle having an annular periphery or rim and transversely-arranged carrier-tubes, a casing inclosing said receptacle and having a tubular extension surrounding the end of the main tube, a sleeve fitting and adapted to slide in the space between the main tube and said tubular extension and bearing against the rim of the receptacle at one end, a packing bearing against the other end of said sleeve, and springs for holding said packing in position and pressing the sleeve against the rim of the receptacle, substantially as described.

23. In a pneumatic-dispatch-tube system, the combination, with a main tube having an upwardly-inclined sending end and a downwardly-inclined receiving end, of terminals therefor each comprising a rotating receptacle having carrier-tubes the normal inclination whereof corresponds with that of the ends of the main tube with which they are connected, substantially as described.

24. In a pneumatic-dispatch system, the combination, with a main tube having an upwardly-inclined sending end and a downwardly-inclined receiving end, of sending and receiving terminals therefor, each comprising a receptacle adapted to rotate in a vertical plane and having oppositely-arranged transverse carrier-tubes, and automatic mechanism whereby said receptacles are actuated upon the introduction of a carrier, substantially as described.

25. The combination, with the sending-terminal of a pneumatic-dispatch system, of a tilting cradle or chute which is normally horizontal, said chute being pivoted eccentrically of its length, whereby it is adapted to be tilted or rocked to discharge the carrier into the terminal when the carrier is placed in said chute, and a counterbalance for returning said chute to its normal position after the discharge of the carrier, substantially as described.

26. The combination, with the sending-terminal of a pneumatic-dispatch system, of a tilting cradle or chute pivoted eccentrically of its length, means for holding said chute normally in a horizontal position and returning it to said position when displaced, and a dash-pot connected with said chute to retard its action, substantially as described.

27. The combination, with the sending-terminal of a pneumatic-dispatch system, of a tilting cradle or chute pivoted eccentrically of its length, means for holding said chute normally in a horizontal position and for returning it to said position when displaced, a piston connected with said chute, and a cylinder in which said piston moves, provided with a valve-controlled outlet and with an inlet having a check-valve, substantially as described.

28. In a pneumatic-dispatch apparatus, a dispatch-tube, a terminal, a receiver for the carriers consisting of receiving-tubes, and mechanism for moving one tube at a time into alignment with the dispatch-tube to receive the carriers, from said dispatch-tube, and means for stopping the carriers in the receiver.

29. In a pneumatic-dispatch-tube apparatus, a dispatch-tube, a terminal, a receiver for the carriers consisting of two receiving-tubes, mechanism for automatically moving said receiving-tubes into alignment with the dispatch-tube to receive the carriers, from said dispatch-tube, and means for stopping the carriers in the receiver.

30. In a pneumatic-dispatch apparatus, a dispatch-tube, a terminal, a receiver for the carriers consisting of receiving-tubes, and mechanism operated by compressed air for automatically moving one tube at a time into alignment with the dispatch-tube to receive the carriers from said dispatch-tube, and means for stopping the carriers in the receiver.

701,870. ARMORED GUN-TOWER. ERIC GUNLUND, Winterthur, Switzerland. Filed May 22, 1901. Serial No. 51,459. (No model.)

Claim.—1. In an armored gun-tower the combination of a standard, with a rotatable carriage mounted thereon, a shield, a gun-casing exterior of said shield and means for rotating said carriage horizontally and gun-

casing vertically above and below the horizontal plane, substantially as described.

2. In an armored gun-tower the combination of a standard, with rotatable carriage mounted thereon, a gun-casing containing a gun running in a slide in said casing, a recoil mechanism, a mechanism for rotating said carriage horizontally and gun-casing vertically above and below the horizontal plane, and a shield protecting said mechanism, said gun being mounted anterior of said shield, substantially as described.

3. In an armored gun-tower the combination of a standard, a carriage mounted thereon, a gun-casing containing a gun running in a slide in said casing, a fluid recoil mechanism, means for rotating said carriage horizontally and gun vertically above and below the horizontal plane, a shield protecting said mechanism and a sighting or aiming mechanism operated from within said shield, substantially as described.

4. In an armored tower the combination of a standard, a carriage mounted thereon, a gun-casing containing a gun, a recoil mechanism a shield, said shield containing observing-scope, a sighting mechanism, means for rotating said carriage and means for rotating and fastening said gun-casing which latter is composed of two sets of gears in a spring-mounting in combination with bevel-gearing, worm-wheel and hand-wheel, substantially as described.

5. In an armored tower the combination of a standard, a carriage mounted thereon, a gun-casing containing a gun, a recoil mechanism, a shield and means for rotating said gun-casing vertically, said recoil mechanism consisting of rollers over which a hand passes, the latter being connected to a piston contained in a cylinder of fluid, substantially as described.

6. In an armored tower the combination of a standard, a carriage carrying an operating-platform, a gun-casing, a shield, and means for rotating said gun-casing vertically above and below the horizontal plane, substantially as described.

7. In an armored tower the combination of a cone-like shield with a gun mounted at the apex thereof and mechanism for swinging the same vertically above and below the horizontal plane, substantially as described.

701,871. BUTTON-SHEWING MACHINE. ARTHUR GLASSMAN, San Francisco, Cal., assignor to Andrew White, Vallejo, Cal. Filed July 8, 1901. Serial No. 57,257. (No model.)

Claim.—1. In a button-sewing machine, the combination of the main driving-shaft, the needle-bar carrier, a rock-shaft operatively connected therewith to shift the same horizontally and driven from the main driving-shaft, a button-clamp mechanism, a cam-wheel driven in a uniform direction from said shaft step by step synchronously with the rocking thereof, said cam-wheel having two cams, a lever for shifting said button-clamp mechanism vibrated by one of said cams, stopping and starting mechanism, and a lever for controlling the latter vibrated by the other cam, substantially as described.

2. In a button-sewing machine, the combination of a shaft extending through the arm of the machine from front to rear, a ratchet-wheel

mounted on the front end of said shaft, and suitably driven from the main driving-shaft, a fixed disk behind the rear face of said ratchet wheel, friction material between said rear face and said disk, a nut on the rear end of the shaft for drawing said wheel toward said disk, a cam-wheel on the rear end of the shaft having a radial groove in its front face, a pin through said shaft arranged to enter said groove to key the cam-wheel to the shaft, and clamp mechanism shifted by said cam-wheel, substantially as described.

3. In a button-coring machine, the combination of a driving-pulley, a clutch sliding in the main driving-shaft, a lever for shifting said clutch, a slide having an arm engaging said lever, a cam-roller carried by said slide, a cam-wheel driven synchronously with the rotation of the main driving-shaft, a spring interposed between the driving-pulley and clutch and holding said roller to its cam, a stud projecting from the cam-wheel, and a pawl-carrying lever for engaging said stud to rotate said cam-wheel to shift the roller from the low to the high dwell, substantially as described.

701,872. STARTING OR STOPPING MECHANISM. AGNES M. MAGNIN, San Francisco, Cal., assignor to Andrew White, Vallejo, Cal. Filed July 8, 1901. Serial No. 67,530. (No model.)

Claim.—1. In a starting and stopping mechanism for sewing or other machines, the combination of a driving-shaft, a driving-pulley loosely mounted thereon, a clutch rotating with said shaft, but slidable thereon, a spring interposed between said driving-pulley and clutch to move the latter from the former, a lever having its free end shutting against the other side of the clutch to move the clutch up to the pulley against the action of said spring, a slide having an arm shutting against said lever to shift the latter, a roller carried by said slide and a cam-wheel, whose cam operates said roller to actuate said slide, substantially as described.

2. In a starting and stopping mechanism, the combination with the main driving-shaft, of a clutch rotating with said shaft and sliding thereon, a lag projecting from said clutch, a lever swinging in a plane at right angles to said shaft and outward therefrom, and a spring for drawing

said lever toward said shaft, said lever having an inwardly-inclined surface arranged to engage said lag when the latter is brought into the plane of the lever to swing said lever outwardly against the action of said spring, the pressure of said spring-actuated lever upon said lag thereby acting as a brake, substantially as described.

3. In a starting and stopping mechanism the combination with the main driving-shaft, of a clutch rotating with said shaft and sliding thereon, a lag projecting from said clutch, a fixed stop upon which the lag impinges when the clutch is moved longitudinally on said shaft, a lever swinging in a plane at right angles to said shaft and outward therefrom, and a spring for moving said lever toward said shaft, said lever having an inclined under surface engaging said lag when said clutch is so moved laterally, thereby acting as a brake, and the end of the lever being distant from the stop substantially the width of the lag, whereby said lever prevents rebound of said lag after its arrest by the stop, substantially as described.

4. In a starting and stopping mechanism, the combination with the main driving-shaft, of a clutch rotating with said shaft and sliding thereon, said clutch comprising a clutch-body having an annular groove and an elongated aperture in its inner surface, a block in said groove having a lag extending through said aperture, a block secured in said groove, and a spring interposed between said blocks, and a stop engaging said lag to arrest said clutch, substantially as described.

5. In a starting and stopping mechanism the combination, with the main driving-shaft, of a driving-pulley loose on said shaft, a clutch rotating with said shaft and sliding thereon, a lag on said clutch, and a spring-actuated stud carried by the driving-pulley, movable in and out relative thereto, and arranged to engage said lag on said clutch, substantially as described.

701,878. DEVICE FOR BRUSHING FLIES FROM CATTLE AND TRAPPING SAME. O. E. CROSS, Thayer, Iowa. Filed Feb. 26, 1902. Serial No. 95,531. (No model.)

Claim.—1. In a device of this character the combination of an enclosure, an entrance-door mounted therein intermediate of its length, a trap in communication with said enclosure, a movable bottom for said trap, means for opening or closing said bottom operated by the entrance-door, and means for brushing the flies from the cattle as they leave the enclosure.

2. In a device of this character the combination of an enclosure, an entrance-door hingedly mounted therein, a trap in communication with said enclosure, a series of rollers mounted in the bottom of said trap to control communication between it and the enclosure, means operated by the entrance-door to revolve said rollers, and means for brushing flies from the cattle as they leave the enclosure.

701,874. BUTTER-CUTTING MACHINE. CHRISTIAN GLASS, Milwaukee, Wis. Filed Dec. 24, 1901. Serial No. 57,171. (No model.)

Claim.—1. A butter-cutting machine comprising a supporting-frame, a table on the frame, a vertically-movable platen having a depending Shank extending through the table central of the same, means in connection with said frame and Shank for actuating the platen, a tab on said table having vertical barbs, means for holding the tab in place, a loose bottom in the tab on said platen, an upper tab-fixing frame, and crossed wires in the latter frame engaging the tab-wall barbs.

2. A butter-cutting machine comprising a supporting-frame, a table on the frame, a vertically-movable platen having a depending Shank extending through the table central of the same, means in connection with said frame and Shank for actuating the platen, a tab on said table having vertical wall-barbs, means for holding the tab in place, a loose bottom in the tab on said platen, an upper tab-fixing frame, crossed wires in the latter frame engaging the tab-wall barbs, and a horizontal gage having a

vertical cone-arm adjustable between the overhead tub and said upper frame thereon.

701,875. CABLE-TERMINAL. BESSIE GORMAN, Wheaton, Ill. Filed Apr. 11, 1900. Serial No. 108,261. (No model.)

Claim.—1. A cable-terminal comprising a casting adapted to receive the end of the cable or conductor, an insulating-bushing interposed between said casting and cable or conductor, and a tapered sleeve adapted to be interposed between the cable or conductor and said bushing, all combined and arranged as and for the purpose set forth.

2. A cable-terminal comprising a casting adapted to receive the end of the cable or conductor, said casting being enlarged into bell shape, an insulating-bushing arranged to be received within the enlarged portion of said casting, and a tapered sleeve interposed between said bushing and the cable or conductor covering or sheathing, said parts adapted to be assembled while the casting is in a heated condition, whereby in shrinking the parts are bound tightly together, as and for the purpose set forth.

3. A cable-terminal comprising a casting, having a socket or nest adapted to receive the end of the cable, and having an enlarged chamber, an insulating-bushing arranged in the enlarged part of said casting, a tapered sleeve interposed between the bushing and the exterior of the cable or conductor, the cavity of said enlarged part adapted to be filled with an insulating compound, all combined and arranged as and for the purpose set forth.

701,876. VARIABLE-SPEED GEARING. FREDERICK W. GORDON, Hartford, Conn., assignor to Pratt & Whitney Company, Hartford, Conn. Filed Feb. 28, 1900. Serial No. 95,389. (No model.)

Claim.—1. In variable-speed gearing, the combination, substantially as set forth, of a first shaft, a shaft parallel therewith, a series of dissimilar-sized gears fast on the first shaft, a gear fast on the second shaft having a length equal to the length of the series of gears on the first shaft, a dotted wall-like support disposed concentric and parallel with said second shaft, a bracket seated upon the inner surface of said support and longitudinally and angularly adjustable upon the inner surface of said support, and a gear carried by said bracket and constantly engaging said long gear and adapted for engagement with any of said dissimilar-sized gears.

2. In variable-speed gearing, the combination, substantially as set forth, of two parallel shafts, selective gearing connecting said two shafts and adapted to serve in transmitting motion from one to the other at selective speeds, a third shaft and a fourth shaft arranged parallel with each other and with their axes parallel with those of the first-mentioned shafts, a gear on the third shaft, a gear on the fourth shaft in the place of the one on the third shaft, a gear on one of said first-mentioned shafts in the place of those on the third and fourth shafts but free of engagement therewith, a rocking tumbler, and a gear carried by said tumbler and constantly engaging the last-mentioned gear and adapted to engage the gear on the third shaft or the gear on the fourth shaft.

701,877. SANDING-MACHINE. OLIVER E. HANCOCK, Toronto, Canada, assignor of two-thirds to Alexander H. Campbell and Vernon Rubin, Toronto, Canada. Filed Jan. 26, 1900. Serial No. 91,178. (No model.)

Claim.—1. The combination with a railway car or vehicle having wheels arranged at opposite sides, respectively, of the car or vehicle, of hoppers arranged within the body of the car and at opposite sides thereof, conveyor-chains located beneath said car and in open communication with the respective hoppers, discharge-apertures depending from each of said chains, and arranged to discharge in advance of the said wheels of said cars, screw conveyors arranged within each of said chains, and having their shafts extending beyond the end of said casing, ratchet-wheels rigidly secured on each of the conveyor-shafts outside of said casing, a pawl-carrying head rotatably mounted on each conveyor-shaft adjacent to the ratchet-wheels and having the pawl in engagement with the teeth of the said ratchet-wheel and means for operatively connecting the respective pawl-carrying heads, substantially as described.

2. The combination with a railway car or vehicle having wheels arranged on opposite sides, respectively, of the car or vehicle, of hoppers arranged within the body of the said car, and at opposite sides thereof,

conveyer-arms located beneath said car and in open communication with the respective hoppers, discharge-spouts depending from each of said cars and arranged to discharge in advance of the said wheels of the said car, screw conveyers located within the respective casings and having the ends of the conveyer-shafts extending beyond the ends of the said casings, a ratchet-wheel rigidly secured on each of the conveyer-shafts outside of said casing, a pawl-carrying head rotatably mounted on each of the said conveyer-shafts adjacent to the respective ratchet-wheel, a pawl mounted upon each of the said heads and arranged to engage the teeth of the respective ratchet-wheel, a rod operatively connecting the said pawl-carrying heads, an operating-rod mounted vertically in an opening in the floor of said car and a bell-crank lever connecting said operating-rod and the said connecting-rod, substantially as described.

3. The combination with a railway car or vehicle having wheels arranged at opposite sides, respectively, of the car or vehicle, of hoppers arranged within the body of the said car and at opposite sides thereof, conveyer-arms located beneath said cars and in open communication with the respective hoppers, discharge-spouts depending from each of said cars and arranged to discharge in advance of the wheels of the said car, screw conveyers arranged within said casings having their ends projecting through the ends thereof, ratchet-wheels keyed on each of the conveyer-shafts outside of said casing, pawl-carrying heads rotatably mounted on each of the said conveyer-shafts adjacent to the said ratchet-wheel, a pawl mounted on the respective pawl-carrying heads and arranged to engage the teeth of the respective ratchet-wheel, a rod operatively connecting the said pawl-carrying heads, a shaft mounted above said connecting-rod and at right angles thereto, a lever-arm forming an operative connection between said connecting-rod and said shaft, an operating-rod mounted vertically in an opening in the floor of said car, a lever-arm forming an operative connection between the said shaft and the said operating-rod, and a spring for holding the last-mentioned lever-arm in its normal position, substantially as described and for the purpose set forth.

701,878. POCKET-KNIFE LEATHER-PUNCH. OWEN L. HARRIS, Calista, Ill. Filed Feb. 20, 1898. Serial No. 95,344. (No model.)

Claim.—1. In a device of the class described, the combination with a knife-handle, of a punch pivoted to the knife-handle and provided with a longitudinal groove to receive the adjacent outer side edge of the handle and to permit the escape of cuttings, said punch being provided with an inner longitudinal cutting edge arranged within the handle when the punch is closed and having an exterior longitudinal portion extending along the handle and arranged to be grasped, substantially as described.

2. In a device of the class described, the combination with a handle, of a punch pivoted to the handle and provided at its inner face with an angular longitudinal groove having flat faces to receive the adjacent portion of the handle and forming an enlarged exterior portion extending along the outer side edge of the handle and arranged to be grasped, said punch being tapered and provided with a curved outer face and having an inner longitudinal cutting edge adapted to be sharpened by grinding the flat face of the inner portion, substantially as described.

3. In a device of the class described, the combination of a knife-handle, and a tapering approximately conical punch, having a curved outer face and provided at its inner face with a longitudinal groove angular in cross-section to fit the adjacent portion of the knife-handle, said punch being composed of an enlarged outer portion extending along the outer side edge of the handle and arranged to be grasped and a thin inner portion having a longitudinal cutting edge and adapted to extend into the knife-handle, substantially as and for the purpose described.

4. In a device of the class described, the combination of a tapering knife-handle and a tapering approximately conical punch, having a curved outer face and provided at its inner face with a longitudinal groove, said punch being also provided with a solid conical point and consisting of an inner thin longitudinal cutting portion fitting within the knife-handle and provided with a longitudinal cutting edge, and an enlarged tapering outer portion extending along the outer side edge of the handle and arranged to be grasped and having a smooth exterior edge and fitting against the tapered portion of the handle, substantially as described.

701,879. APPARATUS FOR GRINDING AND POLISHING GEMS. FREDERICK E. HILLMAN, Brooklyn, N. Y., assignor to Lippman Manufacturing Co., New York, N. Y. Filed Dec. 23, 1891. Serial No. 7,122. (No model.)

Claim.—1. In a machine for cutting and polishing gems, the combination of a standard, means for adjusting same vertically and horizon-

tally, a screw-down support from and revolvably mounted in said standard with means for revolving said shaft, a screw-threaded block arranged to travel on said shaft, means for setting said block rigidly at any point on said shaft, means for registering the elevation of said block, a shoulder on said block and means for adjusting the angle of inclination of the said shoulder, substantially as shown and described.

2. A dip-holder having a cylindrical casing, a spindle revolvably mounted therein, a plurality of toothed disks centered on said spindle, an equal number of toothed steps cut transversely through said casing, a corresponding series of springs on said casing engaging with said steps and tending to engage them with said disks, a corresponding series of latches on said casing holding said steps normally out of engagement and means for releasing the steps from engagement, substantially as shown and described.

3. In a dip-holder, the combination of a cylindrical casing, a spindle revolvably mounted therein, a contained means for positively locking said spindle at any desired point of rotation, with means for measurably indicating each degree of rotation, as and for the purposes set forth.

701,880. HORSE-COLLAR-MOCKING MACHINE. JOSE H. EBERHART, St. Paul, Minn., assignor to Frank E. Purgo and Joseph J. Purgo, Leominster, Wis. Filed Dec. 2, 1901. Serial No. 94,319. (No model.)

Claim.—1. In a machine for shaping horse-collars, means for holding a collar, blocking means arranged above and below said holding means and means for actuating said blocking means to carry the same against the belly and rim of an interposed collar.

2. In a machine for shaping horse-collars, means for holding a collar, blocking devices arranged respectively above and below said holding

means said devices being adapted by independent movement to apply pressure to the interposed collar, and means for actuating said devices.

3. In a machine for shaping horse-collars, clamping-arms for holding a collar, blocking means arranged above and below said arms, and means for actuating said blocking means to apply pressure to an interposed collar.

4. In a machine for shaping horse-collars, clamping-arms for holding a collar, blocking means arranged above and below said arms, and means for independently actuating said blocking means.

5. In a machine for shaping previously-stuffed horse-collars, means for holding a collar, a block supported above said holding means, a die having spring-support below the same, and means for actuating said block and die.

6. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, clamping-arms arranged upon opposite sides of said lower member, a die supported below said arms, and means for actuating said upper block member and said die for the purpose set forth.

7. In a machine for shaping previously-stuffed horse-collars, the combination with the framework, of lower and upper block members, clamping-arms arranged upon opposite sides of said lower member, a die supported below said arms, and means for actuating said block members and said die for the purpose set forth.

8. In a machine for shaping previously-stuffed horse-collars, the combination with the framework, of lower and upper block members, clamping-arms arranged upon opposite sides of said lower member, means for actuating said arms, a die supported below said arms, and means for actuating said block members and said die for the purpose set forth.

9. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, clamping-arms arranged upon opposite sides of said lower block member, means for carrying said arms toward and from said member, a die arranged below said arms, and means for actuating said block members and said die for the purpose set forth.

10. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, clamping-arms arranged upon opposite sides of said lower block member, means for carrying said arms toward and from said member, and means for raising and lowering said block members, for the purpose set forth.

11. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, clamping-arms supported upon opposite sides of said lower member, means for carrying said arms toward and from said member, a die supported below said arms, and means for raising and lowering said block members and said die for the purpose set forth.

12. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, clamping-arms supported upon opposite sides of said lower block member, means for carrying said arms toward and from said member, a die arranged below said arms, and means for actuating said block members and said die for the purpose set forth.

13. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, clamping-arms supported upon opposite sides of said lower member, means for carrying said arms toward and from said member, means for holding said arms in adjusted position, a die arranged below said arms, and means for actuating said block members and said die for the purpose set forth.

14. In a machine for shaping previously-stuffed horse-collars, the combination with the framework, of upper and lower block members, pivotally-supported clamping-arms arranged upon opposite sides of said lower member, means for actuating said arms, a supporting-shaft for said block members, a toggle-joint connection between said shaft and the framework, and driving mechanism connecting said toggle-joint with a source of power.

15. In a machine for shaping previously-stuffed horse-collars, the combination with the framework, of upper and lower block members, a spring-support for said lower member, a vertical shaft supporting said upper member, actuating means for said shaft, clamping-arms arranged upon opposite sides of said lower member, and means for actuating said arms.

16. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, a spring-support for said lower member, a vertical shaft supporting said upper member, actuating means for said shaft, clamping-arms arranged upon opposite sides of said lower member, means for actuating said arms, and means for holding said arms in adjusted position.

17. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, a spring-support for said lower member, a vertical shaft supporting said upper member, means for adjusting said member upon said shaft, means for actuating said shaft, clamping-arms arranged upon opposite sides of said lower member, and means for actuating said arms.

18. In a machine for shaping previously-stuffed horse-collars, the combination with framework, of lower and upper block members, a spring-support for said lower member, a vertical shaft supporting said upper member, means for adjusting said member upon said shaft, means for actuating said shaft, clamping-arms arranged upon opposite sides of said lower member, means for carrying said arms toward and from said lower block member, and means for holding said arms in adjusted position.

701,881. TYPE-DISTRIBUTING MACHINE. PHILIP E. HODGKIN and GEORGE E. KIMMEL, London, England. Filed Dec. 8, 1898. Serial No. 730,654. (No model.)

Claim.—1. A type-distributing machine comprising type-feeding mechanism adapted to feed the type in line, type-ejecting mechanism adapted to separate the types one at a time from the line thereof, a type distributing or grouping device arranged below said type-ejecting mechanism and into which all the type fall, said device being adapted to divide the types into groups and direct the types one by one into one or other of a series of channels corresponding to the particular group to which the ejected type belongs, and a plurality of type-separating devices corresponding to and in communication with the several grouping-channels and each adapted to automatically separate from each other the types corresponding to the particular group of types fed into the same.

2. A type-distributing machine comprising a feed-trough having an exit-opening for types and a separate exit-opening for spaces, mechanism for feeding mixed type and spaces along said trough, type-ejecting mechanism adapted to force the types one by one through the type exit-opening, a type distributing or grouping device adapted to receive the ejected types and divide them into groups, and stationary type-separating devices connected with the type distributing or grouping device and each adapted to automatically separate the types belonging to one group from each other.

3. A type-distributing machine comprising a support for types in column form, a type-trough having a type exit-opening, means for lifting lines of types one at a time from said support and placing them in said trough, mechanism for feeding a line of types along said trough toward said type exit-opening, mechanism adapted to eject the successive types through said exit-opening, a type distributing or grouping device adapted to receive ejected type and direct them into one or other of a series of channels, said channels being in number less than the different kinds of types to be distributed so as to divide the several types of a feed into groups, and a stationary type-separating device adapted to automatically separate the types fed through each channel from one another.

4. In a type-distributing machine, a type-galley having at one end a wall formed with a recess the bottom of which is above the level of said galley and is adapted to carry a line of types, means for pressing a column of types against said wall, a trough arranged in line with said recess and having at one end separate exit-openings for types and spaces,

a vertically-movable pusher adapted to raise the foremost line of types to the level of the bottom of said recess, means for operating said pusher, means for feeding a line of types along said recess and trough toward said exit-hole, and means for ejecting the foremost type through the type exit-opening.

5. In a type-distributing machine, a type-trough having a space exit-opening at one end of a height equal to that of the space to be distributed and a type exit-opening at one side thereof, a pusher adapted when operated to force the foremost type through said type exit-opening, means for operating said pusher, means for lifting a line of types from a column thereof to the level of said trough, means for feeding the raised line of types sidewise into the trough, feeding mechanism for feeding said line of types toward said exit-opening, and means carried by said feeding mechanism for actuating the type-lifting means when said feeding mechanism is drawn back to its starting position, substantially as described.

6. In a type-distributing machine, a type-trough having a type exit-opening one side of which is formed by a movable block or plate, that is normally held in a said position and is capable of moving in opposite directions from said said position and key-operated mechanism adapted to move said block or plate endwise from its normal position to different extents in each direction to vary the width of said type exit-opening to suit the particular type to be ejected.

7. In a type-distributing machine, a type-trough having a type exit-opening one side of which is formed by an endwise-movable block, but is capable of moving in opposite direction from its normal position, a device adapted to hold said block in its normal position but capable of yielding to allow of said block being moved endwise, separate adjusting devices each adapted to move said block endwise from its normal position to a different extent, type-ejecting mechanism, and key-actuated mechanism for operating said adjusting devices.

8. In a type-distributing machine, a type-trough having a type exit-opening one side of which is formed by an endwise-movable block having a projecting part, a spring-lever having a notched portion engaging said projecting part and adapted to hold said block in a yielding manner in its normal position, two sets of separate adjusting devices adapted to act against opposite sides of said pin and move said block endwise to different extents, and key-actuated mechanism connected to said adjusting devices.

9. In a type-distributing machine, a type-trough having a type exit-opening one side of which is formed by an endwise-movable block, a device adapted to hold said block in its normal position but capable of yielding to allow of said block being moved endwise, separate adjusting devices each adapted to move said block endwise from its normal or stationary position in either direction and to a different extent, pivoted frames or levers each connected to one of said adjusting devices, and a series of key-levers, key-levers corresponding to types of given thickness, connecting those of a given normal thickness, acting to operate the corresponding pivoted frame or lever, substantially as described for the purpose specified.

10. In a type-distributing machine, a type-trough having a type exit-opening one side of which is formed by an adjustable block, type-ejecting mechanism, a type discharge-passage arranged below said type exit-opening and leading to a type-separating device, and means comprising a pivoted weight adapted to prevent turning of the types while falling through said discharge-passage, substantially as described.

11. In a type-distributing machine, a type-trough having at one end an exit-opening in line with the trough and of a height above the floor of the trough corresponding to that of a space, and two transverse openings formed through the front and back walls of the trough adjacent to said exit-opening, the opening in the front wall being adjustable in width, a type-ejector arranged to work through the rear opening and force the foremost type of a line of types in said trough through the type exit-opening, key-actuated mechanism for adjusting the width of the type exit-opening to suit the width of the type to be ejected, and means for actuating said type-ejector.

12. In a type-distributing machine, a type grouping or distributing device comprising a support having an inlet-channel for the types to be distributed, a series of plates or shutters fixed at their lower ends to spindles journaled in the back wall of said support and spaced apart at their lower ends so that a series of type-distributing channels can be formed between them, a series of levers each fixed on the rear end of a shutter-spindle, a series of rock-shafts each carrying a lever provided with two pins arranged to embrace one of the levers on the shutter-spindle, and key-operated levers, each of the rock-shafts being adapted to be operated by each of the key-levers corresponding to the types belonging to a particular group of types.

13. In a type-distributing machine, a type grouping or distributing device comprising a chamber or space of gradually-increasing width from top to bottom and having a type-inlet channel at the top and a series of type-distributing channels at the bottom, a series of plates or shutters fixed at their lower ends to spindles journaled in the back wall of said

chamber or recess and arranged to rest against one another at their upper ends and spaced apart from each other and from the inner sides of said chamber at their lower ends, a series of levers each fixed on the rear end of a shutter-spindle, a series of rock-shafts each carrying a lever provided with two pins arranged to embrace one of the levers on the shutter-spindle, and key-operated levers, each of the rock-shafts being adapted to be operated by each of the key-levers corresponding to the types belonging to a particular group of types.

14. In a type-distributing machine, the combination with type-ejecting mechanism, of a type grouping or distributing device comprising a support having a type inlet-channel, a series of plates or shutters fixed to spindles in said support and capable of forming between them a series of type-distributing channels, a series of rock-shafts each adapted to rock the corresponding spindle and shutter and another shutter or shutter that may be resting against it, and key-operated levers, each of said rock-shafts being adapted to be operated by each of the said levers corresponding to the particular types corresponding to a given group of types.

15. In a type-distributing machine, the combination with type-ejecting mechanism, of a type grouping or distributing device comprising a support having a type inlet-channel, a series of plates or shutters pivoted to said support and capable of forming between them a series of type-distributing channels, and each carried by a spindle journaled in said support and provided on its rear end with a two-armed lever adapted to be rocked in opposite directions, a series of key-operated type-levers, and a series of rock-shafts, each adapted to be operated in one direction only from each of the type-levers corresponding to the particular types belonging to a given group of types, each of said rock-shafts except the outermost ones, being pivoted with an arm carrying a two-armed lever provided with pins or projections arranged to extend at opposite sides of the two-armed lever on the corresponding shutter-spindle, and the two outermost rock-shafts being each provided with an arm carrying a single pin, substantially as described for the purpose specified.

16. In a type-distributing machine, a type separating or selecting device comprising a box having a main inlet-channel that serves for the entrance of the different types to be automatically separated from each other and which at different parts is made of different thicknesses or heights corresponding to the different thicknesses of types to be separated, branch passages extending from the main channel at the points where the thickness or height is varied, and deflecting or guiding surfaces between the main and branch passages.

17. In a type-distributing machine, type-ejecting mechanism, a type grouping or distributing device comprising a support having a type inlet-channel through which the ejected types fall, a series of plates or shutters pivoted to said support and capable of forming between them a series of type-distributing channels, and key-actuated mechanism for moving one or other of said plates or shutters to open the proper channel for the type about to be ejected, and an automatic type separating or selecting device having a series of main type-channels corresponding to the several distributing-channels and each of which is made at different parts of its length of different thicknesses or heights corresponding to the different thicknesses of the types in the group of types to be separated from one another and is provided at the parts where the alteration of thickness or height takes place with branch channels and deflecting or guiding surfaces between said main and branch channels, substantially as described.

18. In a type-distributing machine, the combination with type-ejecting mechanism of a type grouping or distributing device comprising a chamber having a type inlet-channel through which the ejected types fall, a series of plates or shutters carried by spindles journaled in the back of said support and capable of forming between them a series of type-distributing channels, levers fixed to said spindles, key-operated type-levers and rock-shafts each adapted to be operated in one direction only from certain of said type-levers and to operate the lever on the corresponding shutter-spindle, and an automatic type separating or selecting device comprising a series of main type-channels corresponding to the several distributing-channels and each of which is provided at different parts along its length with bridge-pieces arranged at different distances from the bottom of the channel corresponding to the different thicknesses of the types to be separated and with branch passages and lateral deflecting or guiding surfaces adjacent to said bridge-pieces, substantially as described for the purpose specified.

19. A type-distributing machine comprising a main type-channel; a series of minor type-channels communicating with and leading from said main channel; means for feeding type into said main channel; and means for diverting the type, according to thickness from said main channel into said minor channels.

701,882. FRAME FOR KEY-MACHINES. DANIEL L. HOLMES, Philadelphia, Pa. Filed Aug. 14, 1901. Serial No. 73,992. (No model.)

Claim.—1. In an key-machine, rectangular-section frame therefor, horizontal flanges in the frame, vertical grooves around the side flanges,

horizontal grooves above the top flange and below the bottom flange, and passage-ways for air above the top flange and for water below the lower flange and connection from the top groove to an exit for the air.

2. In rectangular-section key-machine frame, perforated rectangular flanges therefor, vertical and horizontal grooves around the flanges and connected to the interior of the frame by the perforations thereof, water-passage from the grooves at the bottom of the frame, air and water channels connecting the grooves at the top of the frame, a control passage, and a pump having connection to said passage and adapted to remove the air from the passage-ways and grooves.

3. In an key-machine, rectangular-section frame therefor, perforated flanges for the frame, vertical and horizontal air and water grooves and passages around the flanges, a pump having its supply or suction connection in communication with said grooves and passages and to the frame by the flange-perforations, and a delivery from the pump to the forcing-tank of the machine.

4. In an key-machine, a pair of rectangular-section frames therefor, a pump having connection to each frame to remove the air therefrom, and a check-valve in the delivery-pipe of the pump.

5. In an key-machine, rectangular-section frame therefor, and gates therefor, having a vertical side next the press end, and an angular side opposite thereto, means to remove the gates and uncover the press end and means independent of the moving means to lock the gates when moved into position, to thereby prevent the pressure from forcing the gates upward on their inclined flange.

6. In an key-machine, frame therefor, vertical and gates for the press and means for their moving, shafts supported above the gates, notches in the gates, and means supported on the shafts to engage the notches and thereby lock the gates from raising.

7. In an key-machine, frame therefor having end gates and means for their vertical operation, and means under control of the operator for locking the gates when moved into position and thereby prevent their raising when subjected to pressure.

8. In an key-machine, rectangular-section frame, and gates thereof of wedge shape, means to lift and lower the gates to cover or to uncover the press end, and a yielding material inserted in the vertical face of the gates and adapted to be compressed to exclude air from the frame.

9. In an key-machine, rectangular-section frame therefor, wedge-section end gates for the press, means to operate the gates for closing and unclosing the press, and yielding material so placed and fixed in the vertical face of the wedge-shaped gates as to prevent air-passage between the ends of the frames and their gates when the gates are in operative position against and closing the press.

701,888. GAS-VENTILATOR. FRANK E. BOLT, Milwaukee, Wis. Filed Feb. 24, 1902. Serial No. 84,946. (No model.)

Claim.—1. A device of the class described comprising a bearing-bracket, designed to be mounted on a car or the like, an exterior shaft, mounted on the bracket and provided with an exterior fan, an inwardly-extending shaft also mounted on the bearing-bracket and projecting into

the car, wheels secured to the adjacent ends of the shafts, one of the wheels being resilient and being deflected by the other, and an interior fan connecting with the inwardly-extending shaft, substantially as described.

2. A device of the class described, comprising a bearing-bracket, consisting of a tubular body portion, provided at its outer end with an off-set arm and having an enlargement at its inner end, said body portion being also provided between its ends with a flange, adapted to be secured to a car, an exterior shaft, mounted on the arm, an inwardly-extending shaft arranged in the tubular portion of the bearing-bracket, wheels arranged at the adjacent ends of the shafts and connecting the same, a casing mounted on the outer portion of the bracket and receiving the wheels, an outer fan mounted on the exterior shaft, an inner fan having a socket receiving the enlargement of the bracket, and means for connecting the inner fan with the inwardly-extending shaft, substantially as described.

3. A device of the class described, comprising a bearing-bracket, an exterior shaft mounted thereon, an outer fan secured to the shaft, an inwardly-extending shaft, mounted on the bearing-bracket, and provided at its inner end with a notch, wheels connecting the shafts, an inner fan journaled on the bearing-bracket, and a spring-pressed, pivoted locking device mounted on the inner fan and arranged to engage the notch of the inwardly-extending shaft, substantially as described.

4. A device of the class described comprising a bearing-bracket, a shaft mounted thereon, an outer fan secured to the shaft, an inwardly-extending shaft, mounted on the bearing-bracket, and provided at its inner end with a notch, wheels connecting the shafts, an inner fan journaled on the bearing-bracket, and a spring-pressed, pivoted locking device mounted on the inner fan and arranged to engage the notch of the inwardly-extending shaft, substantially as described.

701,884. END-GATE FOR WAGON. FRANK LEE, Redford, Iowa. Filed Apr. 13, 1902. Serial No. 100,002. (No model.)

Claim.—1. In an end-gate, the combination of a wagon-body, an end-gate, cybels secured to the sides of the wagon-body, an operating-arm pivoted to the end-gate having projections opposite its pivot, hooked rods engaging the cybels and the opposite projections of the operating-arm, a recess in the operating-arm, and a lever-hatch pivoted in the end-gate having a detent and a holding-flap upon one end, adapted to embrace and enter the recess in the operating-arm.

2. In an end-gate, the combination of a wagon-body, a notched end-gate, locking device carried upon one of the notches for locking together the sides of the body, and a latch device carried by the other notches for holding the end-gate in alignment and also locking the sides, whereby the tail-board may be raised and withdrawn horizontally.

701,885. REFRIG. FLAP. H. H. HENRY, South Kensington, England. Filed Oct. 12, 1901. Serial No. 73,001. (No model.)

Claim.—The combination of a recess, a partition perforated with small holes at its inner end, dividing the recess into two chambers, the lower of carbonaceous material in the upper chamber, and a block in the upper chamber holding the flap in position and having a cavity for the reception of the air.

701,886. SYNCHRONIZING ALTERNATORS. ROBERT E. BUSH, New York, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Sept. 14, 1901. Serial No. 73,010. (No model.)

Claim.—1. A phase-indicator for synchronizing alternating-current machines, comprising an indicating device responsive to alternating currents, circuit connections in parallel between said device and a plurality of machines, and current-reducing devices in said parallel connections.

2. A phase-indicator for synchronizing alternating-current machines, comprising an indicating device responsive to alternating currents, circuit connections in parallel between said device and a plurality of machines, current-reducing devices in said parallel connections, and switches for coupling the several machines in parallel relation to a distribution-circuit.

3. A phase-indicator for synchronizing alternating-current generators, comprising a transformer in the secondary circuit of which is included an indicating device and having its primary terminals connected in parallel relation to the two generators to be synchronized, a resistance in series with the transformer and means for coupling said generators in parallel relation to the supply-circuit.

4. Means for coupling alternating-current machines in parallel relation to a common distribution-circuit, comprising controlling-switches for the several machines, a common phase-indicator for all the machines in parallel relation to their leads, and a current-reducing resistance in each parallel circuit, for the purpose described.

5. A synchronizing device for alternating-current dynamo-electric machines consisting of a transformer with means for connecting the machines to be synchronized in parallel relation to its primary, and an indicating device in the secondary.

6. A synchronizing device for alternating-current dynamo-electric machines consisting of a transformer with means for connecting both machines to be synchronized on its primary through a current-reducing device, and an indicating device in the secondary.

701,887. RIVETING AND CONVEYING MACHINE. SAMUEL JAMES, Fayetteville, N. Y. Filed Sept. 24, 1891. Serial No. 74,300. (No model.)

Claim.—1. The operating-lever 20, the rod 40 secured thereto at its lower end, the slotted arm 41 and the brake 42 to which the arm 41 is connected, and the strap 43 combined with the shaft 35, the gear 26 secured thereto provided with the hub against which the brake bears, the pinion 26 secured to the lower end of the shaft 35, an intermediate train of wheels, a platform mounted upon a truck, and having a circular trackway with which one of the train of wheels is made to engage, substantially as shown.

2. A windlass, a suitable train of gears for operating it, the main operating-shaft 29, a friction-clutch which operates with the last one of said train of gears, the rod 52, and the hand-lever 53 by which the friction-clutch is operated, a lever 54 secured to the rod 52, the shaft 55 to which the lever 54 is secured, an arm 56 secured to the shaft 55, an arm 57 pivoted to the outer end of the arm 56, a shoe 58 connected to and operated by the arm 57, and the wheel 59 mounted upon the central shaft 29, substantially as set forth.

3. In a hoisting and conveying machine, the combination with a truck and a rotary superstructure mounted thereon, a gear connected to rotate the wheels of the truck, a friction-drum on one of the revoluble parts, a driving-shaft having loose gears meshing with the former gear at opposite sides of its axis for rotating said former gear in reverse directions, a clutch movable with the shaft and arranged to lock either or neither of the latter gears to the driving-shaft, a brake-shoe normally engaged with the drum when the clutch is released from either of the gears, a clutch-operating member, and means connected to said member whereby the brake engages the drum when the clutch is released from said gears and is disengaged from the drum when the clutch is locked to either of the gears.

4. In a hoisting and conveying machine, the combination with a truck, a vertical shaft connected to the wheels of the truck for propelling the same, said vertical shaft being provided with a gear, a main driving-shaft having loose gears meshing with the former gear at opposite sides of its axis for rotating the said former gear in reverse directions, a clutch arranged to lock either of the latter gears to the former gear, said clutch having a neutral position whereby both of the gears are released, a lever

for holding the clutch in either of its operative positions, and also for rotating the same in its neutral position, a brake-shoe arranged to engage one of the revoluble parts, a toggle connected to the brake-shoe and to the clutch-operating lever, whereby the brake-shoe is forced into engagement with one of the revoluble parts when the clutch is moved to its neutral position.

5. In a hoisting and conveying machine, the combination with a truck and a rotary superstructure mounted thereon and provided with a circular rack, an upright shaft mounted on the superstructure and geared to the rack, said upright shaft being provided with a gear, a main driving-shaft having gears meshing with the former gear at opposite sides of its axis, a clutch arranged to lock either of the latter gears to the former gear, said clutch having a neutral position whereby both of the gears are released, a lever for holding the clutch in either of its operative positions and also for rotating the same in its neutral position, a toggle connected to the brake-shoe and to the clutch-operating lever, whereby the brake-shoe is forced into engagement with one of the revoluble parts when the clutch is moved to its neutral position.

6. In a hoisting and conveying machine, the combination with a truck and a rotary superstructure mounted thereon, of a main driving-shaft mounted on the superstructure, a pinion loose on the shaft, a windlass mounted on the superstructure and geared to the pinion, a friction-drum on one of the revoluble parts of the driving mechanism for the windlass, a clutch for locking the pinion to the shaft, a hand-lever connected to the clutch for moving the same into and out of operative position, a brake movable into and out of engagement with the drum for controlling the speed of movement of the windlass, and means connecting said hand-lever to the brake-shoe whereby as the clutch is moved to its inoperative position, the brake is simultaneously forced into engagement with the drum.

7. In a hoisting and conveying machine, the combination with a truck and a rotary superstructure mounted thereon, of a driving-shaft mounted on the superstructure, a pinion loosely mounted on the driving-shaft, a windlass mounted on the superstructure and geared to the pinion, a clutch for locking the pinion to the shaft and releasing the same therefrom, a drum secured to the pinion, a brake-band controlling the drum, a rock-arm connected to the clutch for moving the same into and out of operative position, a hand-lever, a bell-crank having one arm connected to the brake-band and its other arm connected to the hand-lever and to the rock-arm whereby the clutch is forced to its inoperative position and the brake-band is simultaneously drawn into engagement with the drum.

8. In a hoisting and conveying machine, the combination with a truck and a rotary superstructure mounted thereon, an upright shaft also mounted on the superstructure and geared to the traction-wheels of the truck for rotating the same, a circular rack secured to the truck and hav-

ing its center coincident with the axis of the upright shaft, a second upright shaft mounted on the superstructure and geared to said rack for rotating the superstructure, said upright shaft being provided with gears at their upper ends, independent pairs of gears loosely mounted on the main driving-shaft, the gears of each pair being engaged with the gears on the upright shaft at opposite sides of their respective axes, the gears on the upright shaft being provided with friction-drums, brake-shoes for engaging the drums, a pinion loosely mounted on the main driving-shaft, a windlass mounted on the superstructure and geared to said pinion which is provided with a friction-drum, a clutch interposed between each pair of gears, rock-arms for actuating said clutches, a toggle connected to each of the brake-shoes, a hand-lever connected to each of the clutches and connections between each of the hand-levers and their respective toggles whereby the brake-shoes are forced into engagement with the friction-drums of the upright shaft as the clutches are released, an additional clutch for locking the pinion to the main driving-shaft, a rock-arm for actuating said clutch, a hand-lever, a brake-band for engaging the drum on the pinion and a bell-crank having one arm connected to the brake-band and its other arm connected to the latter hand-lever and to the latter rock-arm for the purpose described.

701,888. SHOW-CASE. ALEXANDER JAMES, Philadelphia, Pa. Filed July 21, 1891. Serial No. 74,301. (No model.)

Claim.—1. In a show-case, a lower frame for embracing the lower edge of the sides, and means for holding the top in contact with the sides, said means consisting of a corner-frame comprising a flat strip resting on the upper edges of the sides at the corners, one struck from the outer edge of the strip and bent down to engage the outer surfaces of the sides and one struck down from the inner edge of the strip to engage the inner surfaces of the sides, said strips removably secured to the outer ends of the upper frame bent to engage the upper corners of the top of the case, as and for the purpose described.

2. In a show-case of the character described, a rectangular framework adapted to rest upon a suitable base, a channel formed in said framework in which the lower edges of the sides of the case are adapted to rest, a rectangular framework adapted to rest upon the upper edges of the sides, legs formed with the upper framework and adapted to be turned downward from the same at each corner and contact the sides upon the outside of the case, legs formed with the upper framework and adapted to be turned down from the same and contact the sides at each corner upon the inside of the case, holes formed in each corner of the upper framework, rods adapted to be passed downward through said holes, heads formed upon the upper end of said rods adapted to abut against the upper corners of the upper frame, holes formed through each corner of the lower framework, laterally-curved threaded nipples adapted to protrude upward through said holes, enlarged heads formed upon the lower end of said nipples adapted to abut against the under surfaces of the lower framework, screw-threads formed upon the lower end of the rods and adapted to be threaded within said nipples, the top of the case adapted to rest upon the upper framework, strips secured to the upper frame at one end, the other end of said strips adapted to be bent over the upper corners of the top and secure the same in position, substantially as described and for the purpose set forth.

3. In a show-case of the character described, a lower rectangular

frame adapted to rest upon a suitable base, the outer edges of said frame adapted to be turned up to form an outer flange, the inner edges of said frame adapted to be bent upward to form an inner flange, the lower edges of the sides of the case adapted to rest in the channel formed between said flanges, projections formed with the outside flanges at each corner and adapted to extend upward above the flanges to strengthen the corners, an upper framework adapted to rest upon the upper edge of the sides, said framework consisting of a flat rectangular strip of metal of about the same relative width as the thickness of the glass forming the sides, two legs formed with said frame at each corner and turned down from the same upon the outside of the sides, two legs formed with said frame at each corner and turned down from the same and adapted to contact the sides upon the inside, vertical connections at each corner adapted to connect the upper and lower framework together, the top of the case adapted to rest upon the upper frame, strips, one secured to each of the outside legs of the upper frame, said strips adapted to be hooked over the edge of the top and hold the same in position, substantially as and for the purpose set forth.

701,889. SWITCH-THROWING DEVICE. CHARLES C. JAMES, Memphis, Tenn. Filed Sept. 4, 1891. Serial No. 74,302. (No model.)

Claim.—1. In a switch-throwing device, the combination with operative devices on the car, of a switch-point, an arm pivoted in advance of the switch-point and a connecting-rod pivotally connected to said switch-point and said arm, and extending diagonally from said arm to said switch-point, all substantially as and for the purpose set forth.

2. In a switch-throwing device, the combination with means of operating said device, of a pivoted switch-point, a switch-throwing arm pivotally mounted between the rails of the track, a second pivot in said arm so located that the line of centers of it and the center pivot of the arm make an obtuse angle with the center line of the arm and a connecting-rod extending from said second center to the switch-point and pivotally connected thereto, substantially as and for the purpose described.

3. In a switch-throwing device, the combination with operative mechanism carried by a car, of a pivoted switch-point, a switch-throwing arm pivoted between the rails in advance of the switch-point, a short lever-arm extending from said throwing-arm at an obtuse angle thereto and a connecting-rod extending diagonally from said lever-arm to the switch-point, substantially as shown and described.

4. In a switch-throwing device, the combination with operating mechanism carried by a car, of a depressed box situated between the rails slightly in advance of the switch-point, a removable cover-plate for said box, a pivoted switch-point, a switch-throwing arm pivoted in said box and having its ends of such length that they swing just within the head of the rail and a connecting-rod extending diagonally from said throwing-arm to said switch-point, substantially as shown and described.

5. In a switch-throwing device for a track having a grooved rail, the combination with operating mechanism carried by a car, of a pivoted switch-point, a switch-throwing arm pivoted between the rails in advance of the switch-point and having its ends of such length that they swing just within the head of the rail and so located that they swing just above the bottom of the groove in said rail, slots cut through the guard-flange of said rail to permit the ends of said throwing-arm to swing into said groove and a connecting-rod extending diagonally from said throwing-arm to the switch-point, substantially as shown and described.

6. In a switch-throwing device, the combination with a pivoted switch-point, a switch-throwing arm pivoted between the rails in advance of said point, and operatively connected with said point, of means carried by the car of operating said switch, consisting of arms pivoted at one end to the underframing of the car and extending forward and terminating in pins which extend upward through the car-platform, a spring for each normally holding the arms in a raised position, switch-operating rods extending downward from same and which when depressed come directly in the path of the switch-throwing arm and guide-pins fastened to the underframing of the car and extending downward therefrom to guide the said operating-rods, substantially as shown and described.

701,890. CARBURIZER. FRED KILMER, Chicago, Ill., assignor, by mesne assignments, of one-half to WILLIAM A. KILMER, Chicago, Ill. Filed Aug. 12, 1900. Renewed Apr. 17, 1902. Serial No. 108,691. (No model.)

Claim.—A carburizer comprising a cylinder divided into three chambers by means of horizontal partitions, one of which is solid and one perforated, the upper and lowermost chambers being adapted to contain naphtha and communicating with each other through a vertical pipe extending from the bottom of the upper chamber to a point adjacent the bottom of the lowermost chamber, a valve in said pipe controlled by a float for maintaining a given level in said lowermost chamber, a filter at the upper end of said pipe, filtering material filling the intermediate chamber and resting upon said perforated partition, a gas-chamber formed in said intermediate chamber and communicating with said lowermost chamber through said filtering material only, a gas-inlet into said lowermost chamber, wicks of absorbent material depending from said perforated partition into said naphtha in said lowermost chamber and adapted to increase the evaporating-surface therein, a gas-outlet from said gas-chamber in said intermediate chamber, and means for filling said upper chamber, substantially as described.

701,891. INTERNAL-COMBUSTION ENGINE. CARWILLAMER W. KILMER, Philadelphia, Pa. Filed Jan. 20, 1901. Serial No. 46,132. (No model.)

Claim.—In an internal-combustion engine, the combination with the cylinder and its inlet-valve, the enlarged chamber at the base of the cylinder, the piston in said cylinder and a fly-wheel in said chamber, connected to the piston for operation thereby and provided on its periphery with a cam-groove, of an exhaust-valve chamber on the cylinder and overhanging the fly-wheel chamber, an exhaust-valve in said valve-chamber and provided with a depending valve-stem having a collar between its

ends and springs at opposite sides of said collar, a vertical spindle extending through a gland or bearing in the fly-wheel chamber to slide and turn therein and provided at its upper end with a collar or sleeve engaged by the lower end of the valve-stem and also forming a bearing for the lower spring thereon, a transverse pivot or shaft on the lower end of said spring and a laterally-movable collar mounted thereon in engagement with said cam-groove, substantially as described.

701,892. GRAVITY-LOCK. DAVID J. KENNEDY, Independence, Mo., assignor of one-third to E. P. DAVIS, Nebraska, Mo. Filed Sept. 20, 1901. Serial No. 70,977. (No model.)

Claim.—1. In a lock, a latch-bolt, a tumbler pivoted in rear of the latch-bolt and carrying at its free end a weight disposed thereover, and a bent link having its terminals pivotally connected with the latch-bolt and with the tumbler intermediate of their ends and adapted to move vertically with the tumbler.
2. In a lock, a latch-bolt, a tumbler pivoted in rear of the latch-bolt and carrying at its free end a weight disposed thereover, a bent link pivotally connected at its terminals with the latch-bolt and with the tumbler intermediate of their ends, the link being adapted for upward movement with the tumbler, and a lifter engaging the under side of the tumbler.
3. In a lock, a latch-bolt, a tumbler pivoted in rear of the latch-bolt and carrying at its free end a weight disposed thereover, an L-shaped link pivotally connected at its terminals with the latch-bolt and with the tumbler intermediate of their ends and freely movable vertically with the tumbler, and a dog adapted to be turned into the path of movement of the rear end of the latch-bolt to lock all of the parts against movement.

701,893. TOP FOR TOOTH-POWDER BOTTLES OR CANS OR OTHER CONTAINERS. HENRY A. KENT, New Brunswick, N. J. Filed Mar. 6, 1902. Serial No. 94,974. (No model.)

Claim.—In a bottle or can top, the combination with a neck portion formed with a discharge-aperture and, for a portion of its length, with screw-threads and at its end with a lateral bulge or shoulder, of a screw-threaded cap engaged with said neck portion and formed at its upper end with a bulge to receive that of the neck and of greater length than that of the neck to permit of the vertical movement of said cap in screwing it to close and expose the discharge-opening, substantially as set forth.

701,894. CRUIS-WAGON. BRAMBLE L. KETTER, Hopedale, Ill. Filed Apr. 12, 1902. Serial No. 102,997. (No model.)

Claim.—1. The box or body of a grain-wagon having a gate on one or both sides, two oppositely-inclined end-boards H H and the inclined side-board I, said boards being loose and their inclination changeable as shown and described.
2. The combination with the three-part false bottom H H I, of the pivoted lower A, seats A' and crank-shaft J, all arranged to operate as shown and described.
3. A wagon body or box having a three-part false bottom of which the side piece I is adapted to be used upon either side which happens to be next the elevator as described.

701,894.

the ends of the chain cord, two similar hollow buttons 13 with eyes 14, one of which serves to secure one end of the chain cord to the shoe, and the other acting to secure a button or cap on the free end of the chain cord, and a spring-rod secured to the opposite side of the opening of the shoe, said parts being arranged so that when a shoe is fastened thereby it will present the appearance of rows of buttons symmetrically arranged on opposite sides of the shoe-opening, substantially as described.

701,897. SAW-CLAMP. WILLIAM I. KIRK, Dubois, Pa. Filed Nov. 14, 1901. Serial No. 82,588. (No model.)

Claim.—1. A device of the kind described comprising a stationary section having a longitudinal recess arranged therein, a shaft revolvably positioned in the said recess, transverse members arranged on the ends of the shaft, arms connected to the said transverse members at their inner ends, a jaw connected to the outer ends of the arms and means whereby said shaft may be operated, substantially as shown and described.
2. A device of the kind described, comprising a stationary section having a longitudinal slot arranged therein in its upper surface, and a shoulder upon its lower surface, a shaft held in the slot and having transverse members arranged on the ends thereof, arms connected at their inner ends to the transverse members and having their outer ends terminating in arched portions, the extreme ends being bent downwardly, a jaw connected to the said downwardly-bent portions, cushions arranged in the apex of the arched portions of the arms, and a handle secured to the said shaft, substantially as shown and for the purpose specified.

701,895. STEAM-GENERATOR. JOHN J. KILMER, Brooklyn, N. Y. Filed June 20, 1901. Serial No. 68,144. (No model.)

Claim.—In a steam-generator, the combination with a casing having within it a furnace, of water-drums at the sides of the furnace, a steam-drum above said water-drums, said steam-drum comprising two members arranged side by side, and out of water communication with each other except through the generating-tubes and water-drums, generating-tubes connecting the steam with the water-drums, and two longitudinal dividing-walls each located within the nest of generating-tubes connecting one of the said water-drums with one of the said steam-drum members, said longitudinal dividing-walls dividing the space into a combustion-chamber and two return-passages.

701,896. SHOES-FASTENER. DONALD H. KENNEDY and WILLIAM W. JONES, Boston, Mass. Filed Dec. 7, 1901. Serial No. 24,877. (No model.)

Claim.—In a shoe-fastener, the combination of an elastic cord or body portion 10, suitable washers 11 having sockets 12 clamped onto

701,898. APPARATUS FOR COLLECTING AND SETTLING DUST. CHRISTIAN E. LARSEN, Chicago, Ill. Filed Mar. 20, 1901. Serial No. 82,023. (No model.)

Claim.—1. A dust-collecting and settling apparatus comprising a descending intake-leg, an ascending discharge-leg, and a part 6 establishing communication between said intake and discharge legs and forming a dust-trap, in combination with pneumatic means to discharge dust into said intake-leg, means to discharge a steam-jet downwardly in the latter, to precipitate the finer dust particles, and means to spray water downwardly in said intake-leg, at a point below said steam-jet, through which water spray the dust particles pass, said discharge-leg permitting the escape of the air after the separation of the dust particles therefrom, substantially as described.

2. A dust-collecting and settling apparatus comprising a descending intake-leg, an ascending discharge-leg, and a part 6 establishing communication between said intake and discharge legs and forming a dust-trap, in combination with pneumatic means to discharge dust into said intake-leg, means to discharge a steam-jet downwardly in the latter to precipitate the finer dust particles, and means to spray water downwardly in said intake-leg, at a point below said steam-jet, through which water spray the dust particles pass, said discharge-leg permitting the escape of the air after the separation of the dust particles therefrom, and means to spray water downwardly in said discharge-leg, to arrest such dust particles as may pass the part 6, substantially as described.

701,899. COMBINED CORN HARVESTER, HOOKER, AND
LOADER. JOHN R. LARSON, Silver Creek, Mo. Filed Mar. 5, 1902.
Serial No. 98,908. (No model.)

Claim.—1. In an apparatus of the character described, the combination with a reel; of a gatherer comprising an endless conveyor provided with teeth or tines to engage and remove the ears from the stalks held by the reel, means for vertically adjusting the gatherer and horizontally adjusting the reel, and gearing for driving the gatherer and reel.

2. In a machine of the character described, the combination with a gatherer for detaching the ears from the stalks; of runners for engaging the stalks to prevent the uprooting of said stalks when the gatherer is detaching the ears, and springs yieldingly supporting said runners and normally pressing the same toward each other.

3. In a machine of the character described, the combination with a gatherer; of runners adapted to engage the stalks to prevent uprooting of said stalks while the gatherer is detaching the ears, springs acting on the runners to normally force them toward each other, and means for vertically adjusting said runners.

4. In a machine of the character described, the combination with a gatherer; of runners for engaging the stalks to prevent the uprooting thereof when the gatherer is detaching the ears, hangers pivoted to the runners and movably connected with the frame of the machine, springs acting on said hangers for normally pressing the runners toward each other, and means for vertically adjusting the runners, substantially as specified.

5. In a machine of the character described, the combination with a gatherer; of spring-actuated runners for engaging the stalks to hold the same fast while the gatherer is detaching the ears, and guides connected to said runners for guiding the stalks to the gatherer.

701,900. TOOL-BOX FOR HAND-CARS. LEWIS LARSON, Norway,
Iowa. Filed Apr. 11, 1902. Serial No. 102,658. (No model.)

Claim.—In combination with a hand-car, a tool-box conforming to the outline of the hand-car-lever standard, and secured thereto, said tool-box being provided with a series of shelves for tools, and a series of hinged, drop-doors, with suitable means for fastening them in closed position, substantially as described.

701,901. QUILTING-FRAME. THOMAS LEWIS SMITHFIELD, Pa.
Filed July 24, 1901. Serial No. 99,388. (No model.)

Claim.—1. In a quilting-frame, the combination with a brace and pairs of legs pivoted thereto, of quilting-rails connecting the legs, and disengageable rest-rods connected to the outer leg of each pair of legs and extending under the inner legs and connected to the brace, said inner legs resting against and being supported by said rest-rods.

2. In a quilting-frame, the combination with a brace and pairs of legs pivoted thereto, quilting-rails connecting the legs, stay-rods disengageably extending from one leg of each pair to the other leg of the same pair, and disengageable rest-rods connected to the outer legs and to the brace and extending underneath the inner legs.

701,902. BURNER FOR CRUDE OIL. THOMAS E. LEWIS, ALBERT
J. RAY, and HILEY R. WILSON, Fort Worth, Tex. Filed Aug. 10, 1901.
Serial No. 71,666. (No model.)

Claim.—1. In a burner for crude oil, a casing having apertures at its upper and lower portions, a wall for forming a flue within said casing, a closure for said upper opening therein, a liquid-conveying surface within said casing, and means for controlling the passage of air through said flue; substantially as specified.

2. In a burner for crude oil, a casing having openings at its upper and lower portions, a wall for forming a flue within said casing, a closure for said upper opening therein, a liquid-conveying surface within said casing, means for controlling the passage of air through said flue, and a perforated burner-plate at the lower portion of said casing; substantially as specified.

3. In a burner for crude oil, a casing, a reversible oil-conducting plate having edge flanges upon opposite faces and apertures therethrough flanged upon one face, and means for removably supporting said plate within said casing; substantially as specified.

4. An oil-conducting plate for a crude-oil burner having side flanges and one end flange upon one face, flanged apertures upon the same face in said plate; substantially as specified.

5. An oil-conducting plate for a crude-oil burner having side flanges and one end flange upon one face, flanged apertures upon the same face of said plate; and a flange upon both sides and ends of the opposite side of said plate; substantially as specified.

6. In a burner for crude oil, a casing provided with openings at its upper and lower portions, a flue-wall therein to form a flue, a burner-plate at the lower portion of said casing having apertures therethrough, and means for controlling the passage of air through said plate and flue; substantially as specified.

7. In a burner for crude oil, a casing provided with openings at its upper and lower portions, a flue-wall therein to form a flue, a burner-plate at the lower portion of said casing having apertures therethrough, and a damper-plate adapted to alternately open or close the openings in said burner-plate or said flue; substantially as specified.

8. In a burner for crude oil, a casing provided with openings at its upper and lower portions, a flue-wall therein to form a flue, a burner-plate at the lower portion of said casing having apertures therethrough, a damper-plate adapted to alternately open or close the openings in said burner-plate and said flue, and an inclined conducting-plate extending from the upper portion of said casing to said burner-plate; substantially as specified.

9. In a burner for crude oil, a casing provided with openings at its upper and lower portions, a flue-wall therein to form a flue, a burner-plate at the lower portion of said casing having apertures therethrough, a damper-plate adapted to alternately open or close the openings in said burner-plate and said flue, and a perforated inclined conducting-plate having flanges surrounding the perforations thereof; substantially as specified.

10. In a burner for crude oil, a casing provided with openings at its upper and lower portions, a flue-wall therein to form a flue, a burner-plate at the lower portion of said casing having apertures therethrough, a damper-plate adapted to alternately open or close the openings in said burner-plate and said flue, a perforated inclined conducting-plate having flanges surrounding the perforations thereof, and a ridge or partition upon said burner-plate at the delivery end of the lowermost conducting-plate; substantially as specified.

11. In a burner for crude oil, a casing provided with openings at its upper and lower portions, a flue-wall therein to form a flue, a burner-plate at the lower portion of said casing having apertures therethrough, a damper-plate adapted to alternately open or close the openings in said burner-plate and said flue, a perforated inclined conducting-plate having flanges surrounding the perforations thereof, a ridge or partition upon said burner-plate at the delivery end of the lowermost conducting-plate, and a pivoted damper for the opening in the upper portion of said casing; substantially as specified.

12. In a burner for crude oil, the combination with a casing, an oil-conducting means therein, of a burner-plate having flanged perforations therethrough, depending flanges at the opposite portions of said burner-plate, and a slide-damper located therein to control the openings in said plate; substantially as specified.

13. A burner for crude oil, a casing provided with openings at its upper and lower portions and having a rear wall extended below its front wall, a flue-wall within said casing, a perforated burner-plate having a flanged edge and adapted to receive the front and rear walls of said casing, means for conducting oil from the upper portion of said casing to said plate, and a damper carried by said plate for controlling the openings therein and the flue within the casing; substantially as specified.

14. In a burner for crude oil, a casing provided with openings at its upper and lower portions and having a rear wall extended below its front wall, a flue-wall within said casing, a perforated burner-plate having a flanged edge and adapted to receive the front and rear walls of said casing, means for conducting oil from the upper portion of said casing to said plate, a damper carried by said plate for controlling the openings therein and the flue within the casing, a lateral rib or partition carried by the upper face of said plate for directing the oil received from the conducting means to the front of said plate beyond said casing; substantially as specified.

15. In a burner for crude oil, the combination with a casing, of an oil-conducting plate therein having flanged apertures therethrough, and a cap or cover for said apertures; substantially as specified.

701,908. CARVING-MACHINE. EMIL R. LOEHMAN, St. Louis,
Mo. Filed July 4, 1901. Serial No. 67,667. (No model.)

Claim.—1. In a carving-machine, a suitable operating-table, a tool-carriage comprising an inner longitudinal shaft and an outer tube freely rotatable about the same mounted in proximity to said table, and having a motion of translation parallel therewith, swinging arms mounted on the carriage and adapted to sweep in planes parallel, and at right angles to the operating-table, and tools in cooperative connection with the free ends of said arms, substantially as set forth.

2. In a carving-machine, a suitable operating-table, means for adjusting the same in planes parallel and at right angles to the operating-surface thereof, a tool-carriage comprising an inner longitudinal shaft and an outer tube freely rotatable about the same mounted in proximity to the table and having a motion of translation parallel with the operating-surface of the table, swinging arms mounted on the carriage and adapted to sweep in planes parallel to and at right angles to the operating-surface of the table, and tools in cooperative connection with the free ends of said arms, substantially as set forth.

3. In a carving-machine, a suitable operating-table, a tool-carriage comprising an inner longitudinal shaft having a motion of translation in a plane parallel to the operating-surface of said table, and an outer tube freely rotatable about said shaft, swinging arms pivotedly connected about said tube and adapted to sweep in planes parallel and at right angles to

the said operating-surface, and tools in cooperative connection with the free ends of said arms, substantially as set forth.

4. In a carving-machine, a suitable operating-table, means for feeding or advancing the same in a plane parallel to the operating-surface thereof, a tool-carriage having an inner longitudinal shaft and an outer tube rotatable about the same mounted in proximity to the table and having a reciprocating motion parallel to said operating-surface, swinging arms mounted on the carriage and adapted to sweep in planes parallel, and at right angles to the operating-surface, and in lines at right angles to the direction of the feed of said table, and tools in cooperative connection with the free ends of said arms, substantially as set forth.

5. In a carving-machine, a suitable tool-carriage having a central longitudinal shaft, means for supporting and guiding the opposite ends thereof, a tube enveloping said shaft and freely rotatable about the same, and a series of arms connected to said tube, and tools in cooperative connection with the free ends of said arms, substantially as set forth.

6. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends of the shaft, ways on which said wheels travel, a tube enveloping said shaft and freely rotatable about the same, a series of tools, and intermediate connections between the tools, and the tube, substantially as set forth.

7. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends thereof, a hollow tube enveloping the shaft, terminal adjustable disks secured to the ends of the tube, a cup located along the outer surface of each disk, and antifriction-balls interposed between each cup and the hub of the adjacent wheel, substantially as set forth.

8. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends of the shaft, parallel peripheral grooves formed in the wheels, and cables wound about the grooves and having their free ends secured to a stationary part of the machine, substantially as set forth.

9. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends thereof, parallel peripheral grooves formed in the wheels, a cable wrapped about the grooves and having its opposite ends secured to a stationary part of the machine, a diagonal depression cut from the rib separating the grooves to allow the wrap of the cable to cross from one groove to the other, and a staple for securing the portion of the cable spanning said depression, substantially as set forth.

10. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends thereof, parallel peripheral grooves formed in the wheels, a cable wound about the grooves, suitable rounded and grooved projections formed on a stationary part of the machine about which the ends of the cable pass, a block having a fixed end and a free end, the free end having an eye for the reception of the end of the cable, a screw for securing the cable within the eye, and a screw operating through an intermediate portion of the block for forcing the free end away from the machine and thus tightening or drawing upon the cable, substantially as set forth.

11. In a carving-machine, a suitable reciprocating tool-carriage means for supporting the same, a main drive-shaft, a swinging arm having

one end loosely embracing said shaft, a second or counter shaft disposed parallel to the main shaft, and carried by the other end of said arm, belt-and-pulley connections between the shafts, a driving-pulley carried by the counter-shaft, a middle pulley suspended from the tool-carriage, guide-pulleys mounted in said saddle, a second pulley mounted on the tool-carriage, a belt passing over the driving-pulley on the counter-shaft and the second pulley on the tool-carriage, and having its respective legs passing over the pulleys of the saddle, the counter-shaft being adapted to rise and fall with the reciprocations of the carriage, a weighted balance-lever pivoted to the stationary part of the machine, and a link pivotally coupling the end of one arm of said lever, to the arm interposed between the main shaft and counter-shaft, substantially as set forth.

12. In a carving-machine, a suitable tool-carriage having an inner longitudinal shaft, stationary ways for supporting and guiding the opposite ends thereof, an outer tube enclosing said shaft, a tool-supporting arm pivoted to the tube, a tool-supporting bar carried between the free ends of said arm, a transverse arm pivotally connected to the tube, and having a forked forward end embracing the tool-supporting bar, and a coupling-pin passed through said fork and into said bar, substantially as set forth.

13. In a carving-machine, a tool-carriage having an inner longitudinal shaft, means for supporting the same, an outer tube enclosing said shaft, a stationary spindle projecting from the periphery of the tube, a pulley mounted on the spindle, a nipple coupled to the inner end of the spindle and having a longitudinally-perforated arm passing through the wall of the tube and an oil-cup at the other projecting end of said arm, the spindle being provided with suitable oil-passages leading to the pulley, substantially as set forth.

14. In a carving-machine, a series of swinging arms, a tool-supporting bar at the free ends of the said arms, the opposite ends of the bar having each formed therewith a cylindrical boss, a stem projecting beyond each of said bosses, a ring loosely embracing each boss, a clamping-screw passed about the stem, a washer interposed between the nut and boss, pins or pegs projecting from the ends of the boss and entering the washer, the free ends of the swinging arms pivotally embracing the rings, substantially as set forth.

15. In a carving-machine, a tool-carriage having a longitudinal shaft, stationary ways for guiding and supporting the opposite ends thereof, said shaft being movable in a direction parallel to itself, a tube enveloping said shaft and freely rotatable about the same, and a series of teeth connected to said tube, substantially as set forth.

16. In a carving-machine, a tool-carriage having a longitudinal shaft, wheels for supporting the opposite ends thereof, ways or tracks on which said wheels travel, a tube enveloping said shaft and freely rotatable about the same, and a series of teeth connected to said tube, substantially as set forth.

17. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends of the shaft, cables wound about the wheels and having each one end fastened to the wheel and the opposite end to a stationary part of the machine, substantially as set forth.

18. In a carving-machine, a tool-carriage having a central longitudinal shaft, wheels for supporting the opposite ends of the shaft, peripheral grooves formed in the wheels, and cables wound about the grooves and having their free ends secured to a stationary part of the machine, substantially as set forth.

19. In a carving-machine, a tool-carriage having an inner longitudinal shaft, wheels for supporting the opposite ends of the shaft, cables wound about the wheels and having each one end fastened to the wheel and the opposite end to a stationary part of the machine, substantially as set forth.

701,904. MACHINE FOR FOLDING COLLAR-MAKER, &c. MARTIN J. LOVER, Troy, N. Y. Filed Dec. 26, 1891. Serial No. 57,543. (No model.)

Claim.—1. In an infolding machine a receiver to receive the object to be infolded; an arm having an upward and downward and a forward and rearward motion; said arm bearing a presser-foot arranged to enter the receiver and turn the edges of the object to be infolded; a movable former member or plate, formed in a continuous piece arranged to slide over the upturned edges of the object to be infolded and press them down; a hinged or pivoted movable pressing or heating table or form having a resilient surface, the resilience being inherent in the material of which said surface is formed, arranged to be forced against the object to be infolded; and means for automatically throwing the infolded article off the table when the article is finished, substantially as described.

2. In an infolding-machine, a swinging table or form consisting of a base; a plate-spring attached thereto and arranged to form a resilient surface to said table or form; a movable former-plate in proximity to said resilient surface; an infolding member arranged to act in conjunction with

the movable former-plate and infold the article to be operated on and hold it in position to be pressed and heated; a course of heat to heat the resilient surface; a discharging member consisting of a pin or stud free to have movement toward and away from the infolded article, its lower end being arranged to move over the material to be infolded in one direction without disturbing it, and to catch and eject it when moved oppositely, all operating substantially as herein shown and described.

3. In an infolding-machine, a tilting or hinged table or form consisting of a base or bed; a plate-spring attached thereto forming a surface movable by reason of the resilience of the plate-spring; a guide or chute attached to the table and arranged to guide the infolded article when finished from the table; means for throwing the finished infolded article upon the chute; means for forcing the table and its resilient face against and from the infolded article that it may be pressed; a course of heat arranged to heat the said resilient face of the table; a movable former member arranged to form the article to be infolded and hold it in position to be heated and pressed all operating substantially as herein shown and described.

4. In an infolding-machine, a movable former-plate arranged to press the edges of the article and infold them; a movable table; a pin or stud moving with said table and having free upward and downward movement, its contact end being beveled and arranged to slide over the infolded article when the table moves forward and to catch in the article when moved backward and remove the article at predetermined times; a blank-supporting member, and means for moving said former-plate and the above-named movable members substantially as described.

701,905. GATE. ELSON H. LOWERY, Henderson, Ky. Filed Mar. 5, 1898. Serial No. 94,593. (No model.)

Claim.—1. The combination of a frame or support, a gate, a vertically-movable locking-bar guided on the frame and arranged to engage the gate, supporting-bars pivotally mounted at opposite sides of the gate, operating-levers fulcrumed on the supporting-bars and connected to the vertically-movable locking-bar, and means for connecting the latter with the gate, substantially as described.

2. The combination of a frame or support, a sliding gate, a vertically-movable locking-bar mounted on the frame or support and located above and adapted to engage the gate at the limit of its movement, the supporting-bars pivotally mounted at opposite sides of the gate, the operating-levers fulcrumed on the supporting-bars and connected with the vertically-movable bar, and a flexible connection extending from the gate to the operating-levers, substantially as described.

3. The combination of a frame or support having a gate-receiving opening and provided with upper bars spaced apart to form an opening, a gate arranged to slide in the lower gate-receiving opening, a pair of pulleys located above the gate, a vertically-movable locking-bar and gate mounted on the frame or support, a tube or casing receiving the lower portion of the locking-bar and guide, operating-levers extending into the upper openings of the frame or support and connected to the said lock-

ing-bar and guide, movable fulcrums supporting the operating levers, and a flexible connection extending between the said pulleys and connected with the gate and with the operating-levers, substantially as described.

701,906. PORTABLE DERRICK. ALEXANDER LOWE, New York, N. Y., assignor to the United States Sanitary and Utility Storage Disposal Company of New Jersey, New York, N. Y. Filed Mar. 21, 1901. Serial No. 89,129. (No model.)

Claim.—1. In a portable hoisting apparatus the combination with a truck, of a suitable frame, a removable base portion therein, a central track located in the top of said frame and adapted to permit of a cart being placed thereunder, a carriage mounted on said track, a hoisting apparatus connected with said carriage whereby the object may be raised at one end of the truck and shifted to the other and lowered.

2. In a hoisting apparatus, the combination with a truck, of a frame having a track located in the upper portion thereof and provided with a collapsible extension, supporting-legs hinged to the outer end of said extension to support the same and means for adjusting said legs for various levels of ground, a carriage located on said track and adapted to operate thereon and on said extension, a winch connected to said carriage whereby objects may be raised beneath the extension and moved to within the main frame of the derrick, as and for the purpose described.

3. In a portable derrick of the class described, the combination with a suitable frame, of a transverse track located in its top portion, an extension hinged to said track, a support hinged to said extension with adjustment adapted to rest upon the ground to retain it in position, a carriage mounted on said track, a hoisting apparatus connected with the carriage for raising, shifting and lowering an object.

4. In a portable derrick of the class described, the combination with a suitable frame containing a transverse track located in its top portion, a carriage mounted upon said track, an extension hinged to said track, sup-

porting-legs hinged to said extension and adapted to rest upon the ground and permit of the free movement of the carriage thereon, a hoisting device whereby said extension is caused against side movement, means connected with the carriage whereby an object may be raised or lowered and shifted beneath the truck.

5. The combination of a suitable frame mounted upon a truck and provided with a removable bar whereby it may be disconnected to permit of the placement of a vehicle thereunder, a centrally-located transverse track situated in the top portion of said frame, a hinged extension for said truck and means for supporting the same in an extended position, means for retaining said extension in a closed or folded position, a carriage mounted upon the truck and connections therefor for raising and lowering an object.

6. The combination in a derrick of the class described, of a frame having a centrally-located track, a collapsible extension secured thereto, collapsible supporting-legs for said extension, adjusting engaging points for said legs to conform to the various levels of the surface beneath, means for retaining said extension in a true extended line from that of the main track, a carriage adapted to operate upon both the main and extended track, connections therewith for suspending an object and shifting the same laterally beneath the truck, substantially as shown and described.

701,907. DEVICE FOR PREVENTING RAIL BURNING. MAGGIORA, PASCAL MAGGIORI, and EMMANO MAGGIORI, Turin, Italy. Original application filed Jan. 26, 1901. Serial No. 45,177. Divided and this application filed Oct. 24, 1901. Serial No. 90,128. (No model.)

Claim.—1. In an apparatus of the character set forth, the combination of a plurality of closed boxes filled with substances to produce explosive gas by means of a suitable liquid, means for introducing liquid successively into said boxes, a suitable gas-holder, and communicative connections between the latter and the boxes, with a suitable explosion-chamber and communicative connections between the latter and the gas-holder, substantially as set forth.

2. In an apparatus of the character set forth, the combination of a plurality of closed boxes filled with substances to produce explosive gas by means of a suitable liquid, means for introducing liquid successively into said boxes, a suitable gas-holder and communicative connections between the latter and the boxes, with a suitable explosion-chamber, an outwardly-facing open mouth on the upper end thereof, communicative connections between the gas-holder and the explosion-chamber, means for admitting air into the explosion-chamber after each explosion, and an electric device for igniting the explosive mixture in said chamber, from a distant station, substantially as set forth.

701,908. BOLT-GUARD. FRED MARTIN, St. Paul, Minn., assignor of three-fourths to Henry Martin, St. Paul, Minn. Filed Aug. 12, 1901. Serial No. 71,677. (No model.)

Claim.—1. The combination with the axle 1 and box 4, the latter having the axle-passages 5 and guard-seat 6, of the guard-section 8, and the supplemental lower guard-section 13 of such width that it may be inserted into working position when and only when the box is dropped on the axle, the plug-strip 7 driven into the upper end of said seat 6, and the springs 14 and 15 within said seat 6 acting on said guard-sections, substantially as described.

2. A bolt-guard for car-journals, &c., comprising a guard-plate having a segmental notch, a segmental wearing-strip of relatively hard material detachably secured within said notch, and a packing-strip of yielding material placed between said wearing-strip and said guard-plate, substantially as described.

3. A bolt-guard for car-journals, &c., comprising the plate 8 with

prongs 9, the segmental wearing-strip 10 detachably secured to said plate 8, flanked with the inner edges of said prongs 9, and the flexible or yielding packing-strip 12 secured between said wearing-strip 10 and plate 8, substantially as described.

4. The combination with an axle and a journal-box, the latter having a vertical guard-seat, of a sand-guard within said seat approximately filling said guard-seat at its upper portion and reduced in thickness at its lower portion to afford increased clearance between the axle and the sides of said seat, substantially as described.

701,909. MOTOR-VEHICLE. JONATHAN D. MAXWELL, Detroit, Mich. Filed Feb. 14, 1902. Serial No. 94,010. (No model.)

Claim.—1. In a motor-vehicle running-gear, the combination with side springs of semi-elliptic or like shape and supported at their ends upon front and rear axles to which said ends are rigidly connected, of transverse rods supported upon said side springs at corresponding points intermediate their length and having their ends secured thereto independently of each other, the motor supported upon said transverse rods independently of the side springs and the body supported upon the side springs independently of the motor.

2. In a motor-vehicle running-gear, the combination with side springs of semi-elliptic or like shape and supported at their ends upon front and rear axles to which said ends are rigidly connected, of transverse rods supported upon said side springs at corresponding points intermediate their length and having their ends adjustably connected to said springs independently of each other, a motor supported upon said transverse rods intermediate between the side springs and forming with its frame a rigid connecting member between the transverse rods and a vehicle-body pivotally supported upon the side springs at points intermediate between the points at which the transverse rods are supported.

3. In a motor-vehicle running-gear, the combination with side springs the ends of which are secured to the front and rear axles and upon which the motor and the body are supported, of a motor having its frame formed with bearings at right angles to the frame, transverse rods passing through said bearings and having their ends rigidly supported upon and adjustably secured to said side springs independently of each other, the motor-frame being laterally adjustably secured upon the transverse rods.

4. In a motor-vehicle running-gear, the combination with side springs the ends of which are secured to the front and rear axles and upon which the motor and the body are supported, of a motor having its frame formed at or near the ends with clamping-bearings, of transverse rods passing through said bearings and adjustably supporting the motor upon said rods, and plates secured to the ends of the transverse rods said plates secured upon the side springs by clamping-bolts and forming means for the longitudinal adjustment of the motor.

5. In a motor-vehicle running-gear, the combination with side springs the ends of which are secured to the front and rear axles and upon which the motor and the body are supported, of a motor having its frame formed with bearings at right angles thereto, transverse rods passing through said bearings and having their ends supported upon and secured to the side springs independently of each other, and a body having side bearings supporting the body upon the side springs independently of the motor at a point intermediate between the ends of the transverse rods.

6. In a motor-vehicle running-gear, the combination with side springs secured at their ends to the front and rear axles and carrying the motor and the body, of transverse rods rigidly connecting the side springs together at points intermediate their ends and forming the supports of the motor, the frame of the motor being provided near its opposite ends with bearings through which the transverse rods pass, and a body provided with side bearings pivotally supporting the body upon the springs intermediate between the points at which the motor is supported upon said springs.

7. In a motor-vehicle running-gear, the combination with side springs secured at their ends to the front and rear axles and upon which the body and the motor are supported, of a motor having its frame provided with bearings at right angles to the frame, transverse rods passing through said bearings and supporting the motor upon the side springs the ends of said rods being rigidly secured to the side springs independently of each other and a vehicle-body pivotally connected to the side springs at a point between the points where the transverse rods are connected.

8. In a motor-vehicle running-gear, the combination with side springs secured at their ends to the front and rear axles and carrying the motor and the body, of a motor supported upon transverse rods secured in bearings in the frame of the motor and having their ends rigidly connected to the side springs, a vehicle-body provided with side bearings pivotally supporting the body upon the side springs independently of the motor, between the points at which the transverse rods are secured to said springs, an elliptic spring interposed between the front end of the body and the front axle, and means for causing friction upon the points of the side bearings of the body.

9. In a vehicle running-gear, the combination with the side springs and the axle to which the ends of the side springs are secured, of clips each comprised of a split collar securing the clip to the axle and formed with a bearing-plate extending crosswise over the axle and upon which the flattened end of a side spring is supported, a cap-piece having an outer end which bears upon the outer end of the spring, and an inner end formed of two side bars which bear upon the top of the axle and a cross-bar uniting the outer ends of the side bars and bearing against the under side of the inner end of the bearing-plate and a bolt which clamps the outer ends of the cap-piece and of the bearing-plate together.

10. In a vehicle running-gear, the combination with the side springs and the rear axle to which the ends of the springs are secured, of clips, each composed of a split collar secured upon the axle and formed with a bearing-plate extending crosswise over the axle and upon which the flattened end of the side spring is supported, a cap-piece having an outer end which bears upon the outer end of the side spring and confining it against end-wise movement and an inner end formed of two side bars extending inwardly over the axle and bearing upon the top of the axle and a cross-bar uniting the ends of the side bars and bearing against the under side of the inner end of the bearing-plate, a bolt adjustably clamping the outer end of the cap-piece to the outer end of the bearing-plate and a set-screw carried by the cross-bar of the cap-piece and adapted to adjust said cap-piece longitudinally upon the bearing-plate.

11. In a vehicle running-gear, the combination with the side springs supporting the body and motor, of the front axle rigidly secured to the ends of the side springs and having pivoted stub-axles provided with crank-arms, the block *k* centrally deaved upon the front axle and held in place thereon against longitudinal displacement, the spring *M* interposed between the front axle and the forward end of the body and having the upper and lower ends thereof pivotally supported in vertical bearings in the front end of the body and in the bearing-block *k* respectively, and the arm *A'* carried by the spring and connected with the crank-arms of the stub-axles.

12. In a vehicle running-gear, the combination with the side springs supporting the body and motor upon the axle and having their ends rigidly secured thereto, of the body having side bearings pivotally supporting the body upon the side springs, the elliptic spring *M* interposed between the front axle and the forward end of the body free to turn upon

its vertical axis and the block *k* deaved upon the front axle and to which the spring is pivotally connected in the vertical axis of the spring substantially as described.

13. In a vehicle running-gear, the combination with the side springs having their ends rigidly connected to front and rear axles, the front axle carrying steering wheels pivotally connected to the ends of the axle, of a vehicle-body pivotally supported upon the side springs, an elliptic spring interposed between the front axle and the front end of the vehicle free to turn upon its vertical axis, a steering-post mounted upon the top of the spring a pivot-pin secured to the under side of the spring in the axis of the steering-post a block deaved upon the front axle and provided with a vertical bearing for the pivot-pin, in which said pivot-pin is secured free to turn and steering connection between the lower end of the spring and the front wheels.

14. In a vehicle running-gear, the combination, with the vehicle-body supported upon side springs and the front axle to which the ends of the side springs are rigidly secured and carrying steering-wheels pivotally connected to the front axle, of the elliptic spring *M* interposed between the front axle and the front end of the vehicle-body, the steering-post *J* secured upon the top of the spring *M*, the bearing *J'* secured to the body of the vehicle and through which the steering-post passes, the clamping-plates *P* *P'* secured to the lower part of the spring *M*, the steering-arm *P'* carried by the clamping-plate *P'* and connected with the steering-wheel, the pivot-pin *P'* carried by the plate *P'* and provided with a nut upon its lower end, the block *k* deaved upon the front axle and provided with a bearing *P'* through which the pivot-pin passes and the split collar *P'* united by a cross-bar *P'* and securing the block *k* against end-wise movement upon the front axle.

15. In a vehicle running-gear, in combination with side springs and cross-bars connected therewith intermediate between the ends and supporting the motor, of a vehicle-body pivotally supported upon side bearings upon said springs at corresponding points intermediate between the cross-bars, each side bearing consisting of two plates, one secured upon the side spring and the other supporting the body, the two plates pivotally connected side by side upon the same horizontal plane by a pivot-pin secured in one of the plates and journaled in a bearing formed in the other plate at right angles to the side spring, the body-supporting plate being supported outside of the side spring free to oscillate upon the pivot.

16. In a vehicle running-gear, in combination with side springs supported upon the front and rear axles and having raised side portions, of a vehicle-body pivotally supported intermediate its ends upon the raised body portions of the side springs free to oscillate in a vertical longitudinal plane and an elliptic spring interposed between the front axle and the forward end of the body in the longitudinal center of the body, the top of said spring being substantially on a level with the top of the raised body portion of the side springs and pivotally connected with the vehicle-body in the vertical axis of the spring free to turn the spring upon said axle, the under side of said spring pivotally connected to a bearing-block deaved upon the front axle whereby said bearing-block pivotally supports the spring on the front axle free to turn said spring upon its vertical axis independent of the rocking motion of said front axle caused by the action of the side springs.

17. In a vehicle running-gear, in combination with side springs secured to the front and rear axles and formed with raised horizontal main portions of tubular cross-bars securing the side springs together at the ends of the raised main portions, bearing-plates supported upon the raised main portions of the side springs and provided with notches into which the ends of the cross-bars are secured, said bearing-plates independently adjustably secured upon the raised main portions of the side springs by clips clamping the plates and the component parts of the side springs together, and a motor adjustably secured upon the tubular cross-bars at right angles thereto by means of clamping-bearings formed on the motor-frame.

18. In a vehicle running-gear, in combination with the front and rear axles, and the side springs rigidly clipped at their ends to said axles and supporting the body and the motor, of a block centrally deaved upon the front axle, split clamping-collars secured upon said front axle on opposite sides of the block and an elliptic spring interposed between the front axle and the front end of the body free to turn upon its vertical axis, the lower end of said spring secured between clamping-plates one of which carries a steering-arm and the other a pivot-pin pivotally supporting the spring upon the block.

701,910. MACHINE FOR CUTTING FABRICS. HENRY A. MEYER, Cincinnati, Ohio, assignor to The Wolf Electrical Fracturing Company, Cincinnati, Ohio, a Corporation of Ohio. Filed Apr. 18, 1901. Serial No. 95,129. (No model.)

Claim.—1. In a fabric-cutting machine, a foot-plate having a standard rising therefrom provided with confronting guideways, a block carrying a knife fitted between and engaging said guideways, auxiliary rotary guides for said block, antifriction-bearings for said rotary guides, and means for reciprocating the block, substantially as described.

2. In a fabric-cutting machine, a foot-plate having a standard arising therefrom provided with confronting guideways, a block carrying a knife fitted between and engaging said guideways, auxiliary rotary guides for said block, antifriction-bearings for said rotary guides, and means for reciprocating the block, substantially as described.

3. In a fabric-cutting machine, a slide-way, a reciprocating block therein, the two having corresponding beveled and grooved guiding edges, rotary rings or shells also guiding the block, a knife carried by said block, and means for operating the block, substantially as described.

4. In a fabric-cutting machine, a slide-way, a reciprocating knife-carrying block therein, the two having interengaging beveled and grooved guiding edges, and auxiliary rotary guides for said block, substantially as described.

5. In a fabric-cutting machine, a slide-way, a reciprocating knife-carrying block therein, the two having beveled and grooved guiding edges, and rotary auxiliary guides for the block comprising rings or shells constructed in conformity with the edges of said block, substantially as described.

6. In a fabric-cutting machine, a slide-way, a reciprocating knife-carrying block therein, the two having corresponding beveled and grooved guiding edges, rotary auxiliary guides for said block, and antifriction-bearings for said guides, substantially as described.

7. In a fabric-cutting machine, a slide-way, a reciprocating block therein, the two having corresponding beveled and grooved guiding edges, and rotary rings or shells also serving to guide the block and provided with ball-bearings, substantially as described.

8. In a fabric-cutting machine, the standard formed with the slide-way, the guide-plates at the sides of the latter having beveled guiding edges, a reciprocating block in said slide-way having correspondingly-grooved guiding edges, and antifriction-bearings also at the sides of the slide-way, said bearings each comprising a screw-bolt having an integral ring and an adjustable ring, the two constructed to form a groove, a series of balls seated in said groove, and an insulating ring or shell similarly grooved interiorly and beveled at the edge and received in the grooves of said block, substantially as described.

9. In a fabric-cutting machine, the standard formed with the slide-way, the guide-plates at the sides of the latter, a reciprocating block guided in said slide-way between the plates, rotary auxiliary guides for said block, and antifriction-bearings for said auxiliary guides, substantially as described.

10. In a fabric-cutting machine, a foot-plate having a standard rising therefrom provided with confronting guideways, a reciprocating knife-carrying block fitted between said guideways and engaging said guideways, auxiliary rotary guides for said block, and means for reciprocating said block.

701,911. STAMP AND ENVELOPE MOUNTING. CHARLES W. MILLER, Columbus, Ohio. Filed Oct. 30, 1901. Serial No. 95,130. (No model.)

Claim.—1. In a device of the character described, the combination of a foot-plate having a standard rising therefrom provided with confronting guideways, a block carrying a knife fitted between and engaging said guideways, auxiliary rotary guides for said block, and means for reciprocating the block, substantially as described.

with the water-receptacle, of a sponge-holder integral therewith, said receptacle being formed with grooves in its sides and base, a spring-clamp having portions thereof engaged with the grooves in the sides and base of the receptacle and their upper ends projecting over the receptacle and adapted to clamp said receptacle to the under side of a shelf, substantially as set forth.

701,912. CLOVER-HARVESTER. ALAN D. HIGGINS, Portland, Ind. Filed Dec. 26, 1904. Serial No. 57,507. (No model.)

Claim.—In a clover-harvester, a front bar, bottom strips secured thereto extending rearwardly and having their ends curved upwardly, side plates converging toward the rear and increasing in height and having curved edges 7, standards secured to the sides, a shaft supported by the standards, fingers carried by the shaft and projecting to the upper ends of the bottom strips means for partially rotating the shaft, and hooks on the finger-bar engaging the front bar of the receptacle, as and for the purpose described.

701,913. DRAWING-FRAME. JOHN DE HEMMER, Lohr, Baden. Filed Oct. 11, 1905. Serial No. 595,948. (No model.)

Claim.—In an apparatus of the character described, the combination with two drawing-rollers and an endless elastic band passing around said rollers, of guide-rollers arranged intermediate the drawing-rollers and over which guide-rollers one section of the band intermediate the drawing-rollers passes, the guide-rollers being so arranged relatively to the drawing-rollers as to cause the section of the band passing over them to be folded in the manner and for the purpose specified.

701,914. FAN-MOTOR ATTACHMENT. WALTER S. MOODY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Oct. 26, 1905. Serial No. 54,478. (No model.)

Claim.—1. The combination, with a suspended fan-motor and its casing, of an arm extending from the casing to a point beyond the tips of the fan-blades and capable of being permanently bent to adjust the same to various positions, and an electric conductor supported on said arm and provided at or beyond the end of the arm with a circuit-closer.

2. The combination, with a suspended fan-motor and its casing, of an arm extending from the casing to a point beyond the tips of the fan-blades and capable of being permanently bent to adjust the same to various positions, a flexible electric conductor supported on said arm and extending to a point beyond the end of the arm and provided at its end with a circuit-closer.

3. The combination, with a suspended fan-motor and its casing, of a tubular arm extending from the casing to a point beyond the tips of the fan-blades and capable of being permanently bent to adjust the same to various positions, a flexible double electric conductor included in the ar-

out of the motor and led through said arm, and a circuit-closer at the end of said conductor.

701,915. PROCESS OF FORMING SECONDARY-BATTERY PLATE. THOMAS WILLIAM HENNING, Chicago, Ill., assignor to the Electro-Upton Company, Chicago, Ill., a Corporation of New Jersey. Filed June 18, 1905. Serial No. 58,655. (No model.)

Claim.—1. The improved process in the art of forming battery-plates having undulating faces, which consists in covering the recessed faces with a sheet of thin substantially rigid formless material, securing the latter yieldingly against said face, then placing in a forming-boat and forming by the aid of an electric current and finally removing the formless sheet before use, substantially as described.

2. As an improvement in the art of forming double-faced recessed secondary-battery plates, first including the plate between two conducting substantially rigid formless sheets firmly but yieldingly pressed against the active surfaces of the plate, and then subjecting said battery-plate while included between said conducting-plates to the forming process and finally removing the including plates therefrom, substantially as described.

701,916. SAW FOR MAKING SECONDARY-BATTERY GRIDS. WILLIAM HENNING, Chicago, Ill., assignor to the Electro-Upton Company, Chicago, Ill., a Corporation of New Jersey. Filed June 18, 1905. Serial No. 58,655. (No model.)

Claim.—1. A saw for making battery-grids, &c., having a body of less thickness than the width of its teeth and having teeth of regularly-tapered diminishing thickness from their cutting edges inwardly toward the body and laterally out away on alternate sides, substantially as described.

2. A gang of saws for use in making battery-grids, comprising an arbor, a plurality of saws secured thereon and each having a body of regularly-tapered diminishing thickness from its periphery toward its center and its teeth cut away laterally on alternate sides, and spacing disks or washers between the saws, substantially as described.

3. A circular saw for use in making battery-grids, having a body of regularly-tapered diminishing thickness from its periphery toward its center and provided with the teeth 4, each having the inclined chamfered 7 and the lateral chamfered 8, substantially as described.

701,917. SECONDARY BATTERY. WILLIAM HENNING, Chicago, Ill., assignor to the Electro-Upton Company, Chicago, Ill., a Corporation of New Jersey. Filed June 18, 1905. Serial No. 58,657. (No model.)

Claim.—1. An element for secondary batteries formed by electro-chemical action from a plurality of flat sheets of lead leaf or foil, said sheets being arranged in pairs in juxtaposition and having elongated apertures, the apertures of one leaf or sheet of each pair extending transversely across the apertures of the other leaf of said pair, substantially as described.

2. An element for secondary batteries, composed of a plurality of sheets of lead leaf or foil arranged in pairs, one sheet of each pair having cooperatively short apertures and the other leaf of said pair having long apertures arranged to cross two or more of the apertures of the first-mentioned leaf, substantially as described.

3. A secondary-battery element composed of a plurality of perforated sheets of lead leaf or foil, having elastic material interspersed between each pair of adjacent sheets, and rolled into spiral form, said element as a whole having the form of a relatively long cylindrical body, whereby access of an electrolyte to the main portion of the element, is had through the perforations chiefly, and expansion incident to forming is provided for.

4. In a secondary battery, the combination, with an inner element composed of a plurality of sheets of lead leaf or foil rolled into spiral shape, of a similarly-constructed outer element, including said first element and an expandable insulating material located between the two elements, substantially as described.

5. The combination, with an inner element composed of a plurality of perforated sheets of lead leaf or foil rolled into spiral form, of a similarly-constructed outer element, including said first element and a perforated sheet of insulating material located between said elements, substantially as described.

6. The combination, with the inner and outer elements composed of a plurality of sheets of lead leaf or foil spirally wound, of a corrugated sheet of insulating material interspersed between the two, and rods or tubes of insulating material inserted in the corrugations, substantially as described.

7. In a battery of the character described, the combination with an element having a body portion composed of a plurality of perforated sheets of lead-leaf, rolled into spiral form, of an including casing consisting of a discontinuously integral and uninterrupted tube of lead having terminal projection formed integral therewith, substantially as described.

8. A battery element consisting of a plurality of pairs of sheets of lead or foil wound spirally around each other, the members of each pair of sheets being arranged in juxtaposition and annular spaces being provided between each pair of a width greater than the thickness of single sheets, as and for the purpose set forth.

9. A battery element comprising a plurality of sheets of lead leaf or foil, formed spirally around each other, each pair of leaves consisting of flat perforated leaves arranged in juxtaposition to each other and annular spaces arranged between each adjacent pair of leaves, whereby the leaves of each pair are in contact with each other, but are free from contact with the leaves of adjacent pairs, substantially as described.

701,918. MEANS FOR PREVENTING THE DISTORTION OF SECONDARY-BATTERY PLATES DURING FORMING. WILLIAM HENNING, Chicago, Ill., assignor to the Electro-Upton Company, Chicago, Ill., a Corporation of New Jersey. Filed June 18, 1905. Serial No. 58,658. (No model.)

Claim.—The combination, with a battery-plate forming one electrode of an electric charging-circuit and a battery-plate, of a bridge-piece, formed of a board or slab of a width equal to the internal width of the coil and provided with a central slot extending from one end inwardly a distance equal to the vertical depth of the battery-plate and adapted to receive and fit closely upon the latter; the outer edges of said bridge-piece being adapted to bear against the walls of the coil, while the inner edges bear against the sides of the plate, substantially as described.

701,919. LAMP-BURNER. STEPHEN S. HOGAN, Rahway, N. J. Filed Aug. 21, 1891. Serial No. 73,795. (No model.)

Claim.—1. In a central-draft burner a wick and an air-distributor having an inwardly-extending flange or rim resting upon the wick and supported by the wick whereby the distributor will be raised and lowered by the wick, substantially as described.

2. In a central-draft burner, the combination of wick-casing tubes and a wick therebetween with a perforated air-distributor having an inwardly-extending flange or rim resting upon the wick when the latter is raised above the tubes and acting as an extinguisher by closing the space between the tubes when the wick is turned down, the distributor being provided with a depending guide guided to travel along the tube to direct the vertical movement of the distributor when raised or lowered by the wick, substantially as described.

3. As an article of manufacture, a perforated air-distributor for a lamp or stove having a flange or rim to overlie a wick, said flange or rim having grooves providing spaces between the wick and the flange or rim to receive gas or vapor, substantially as described.

701,920. BOLSTER FOR RAILWAY-CARS. GEORGE C. MURRAY, Chicago, Ill. Filed Mar. 4, 1904. Serial No. 57,355. (No model.)

Claim.—1. In a bolster of the class described, the combination of a compression member provided with box-shaped ends open at the top, a tension member passed through the box-shaped ends and around the end of the top portion, and an interposed strut, substantially as described.

2. In a bolster of the class described, the combination of a compression member formed of cast metal with box-like ends open for a portion of the top at the extreme ends thereof and returned downwardly and backwardly in a V-shaped manner to strengthen the box at each point, a compression member formed of plate metal passed through the box around and up over the return-ends of the compression member, and an interposed strut, substantially as described.

3. In mechanisms of the class described, the combination of a compression member provided with a box-shaped end with return-ends, a tension member of less length than the length of the compression member passed through the box-shaped portion and around the return-ends of the bolster, substantially as described.

4. In mechanisms of the class described, the combination of a compression member formed of a central longitudinal web portion, laterally-integral flanges thereon extending beyond the ends of the web portion, a tension member passed around and above the ends of the web of the

compression portion and secured thereto, and an interposed strut, substantially as described.

3. In mechanism of the class described, the combination of a compression member formed of a longitudinal central web portion, integral flange extending downwardly and longitudinally thereof and beyond the ends of the web portion and connected together at their bottom and extreme end portions, a tension member of plate metal passed through the apertures at the ends of the compression member upwardly and around the ends of the web portion thereof to which it is secured, and an interposed strut, substantially as described.

4. In mechanism of the class described, the combination of a compression member formed of a central web portion, integral flange extending downwardly from the lateral edges longitudinally thereof and beyond the ends of the web portion and joined together at the bottom and end portions thereof in one integral casting and provided with an integral strengthening return-head flanged fillet where the ends of the web connect with the box-shaped ends, a tension member formed of plate metal passed through the box-shaped ends upwardly and around the return-head fillet of the web and to which it is secured, and an interposed strut substantially as described.

701,921. CONTROLLING THE GENERATION OF STEAM. OWAS HUNTER, ARTHUR HUNTER, and WILLIAM G. HAY, Liverpool, England. Filed Oct. 26, 1900. Serial No. 34,302. (No model.)

Claim.—In steam-power machinery, wherein the rate of generation of steam is automatically governed, the combination of a steam-generator, comprising a plurality of annular coils *b* *b'* *b''*; a closed furnace *a* adapted to receive and have solid fuel burned within it, in direct connection with the heating-space about said coils; an auxiliary steam-motor *c*; a pipe *d* connected with the steam-supply pipe of the generator, for supplying steam to the motor *c*; controlling-valve *e* on said pipe *d*; a pressure-governor *f* actuated by the pressure within the steam-generator, connected with and adapted to operate the valve *e*; a pipe *h* connecting said pressure-governor with a suitable pipe connected with the steam-generator and subject to the pressure thereof; an air-supplying fan *g* and feed-water pump *g'*, both driven by the auxiliary motor *c*; and conduits *i* and *j* connecting the fan with the closed furnace *a*, and the pump with the steam-coils of the steam-generator respectively; substantially as herein set forth.

701,922. CONSTRUCTION OF PORTS. PETER J. NELSON, Baltimore, Md. Filed Aug. 21, 1901. Serial No. 73,837. (No model.)

Claim.—1. A fortification structure having its roof and side walls inclined at varying angles, a platform within the structure, a plurality of

rows of port-holes and a search-light having an electric connection with the structure.

2. A fortification structure comprising a base of masonry and inclined top and sides formed of a composite plate consisting of inner and outer layers of steel, a layer of paper adjoining the inner steel layer and a layer of rubber interposed between the outer steel layer and the layer of paper.

3. A fortification structure comprising oppositely-inclined side walls, a roof inclined at different angles, thereby avoiding the exposure of flat surfaces to the fire of the enemy, a platform located within the structure and tracks adjacent to said platform for the transportation of ammunition.

701,928. BED-MACHINE. WILLIAM D. NEWMAN, Toledo, Ill. Filed Aug. 1, 1902. Serial No. 26,578. (No model.)

Claim.—The combination of a bedstead having a centrally-arranged distal, the lever 2 permanently pivoted to the central distal and located wholly beneath the same and projecting beyond each side of the distal, the transversely-disposed cylinder passing through the lever at opposite sides of the central distal and having their eyes located at the opposite edges of the lever, the diagonal and transverse brace-rods 5, located wholly beneath the distal and provided at their ends with eyes, the lower eyes being linked into the eyes of the lever, permanently connected with the latter, the eyes 1 located at opposite sides of the bedstead at the center and at the ends of the same and receiving the outer eyes of the brace-rods and permanently securing the same to the bedstead, and the locking device also located wholly beneath the distal and consisting of the rod 7 hinged at its inner end to the lever and provided at its outer end with a hook, and an eye mounted on the bedstead at one side thereof and arranged to be engaged by the hook, substantially as described.

701,924. CHEESE-CUTTER. RUEL FROST, San Antonio, Tex. Filed Sept. 9, 1901. Serial No. 74,770. (No model.)

Claim.—1. In a cheese-cutter, the combination with a rotatable platform and a knife, of a radially-movable scale-plate bearing against the cheese on one side of the knife, and an extension of the scale-plate bearing against the cheese on the other side of the knife.

2. In a cheese-cutter, in combination, a stationary platform having brackets thereon, a rotatable platform thereon, knife-bars pivoted upon

said brackets, a knife attached to the knife-bars, and an expanding belt between the knife-bars adapted to cause them to bind at the pivot, against said brackets.

3. In a cheese-cutter, in combination, a stationary platform, a rotatable platform thereon, a yielding radially-slidable bar supported on the stationary platform, a scale-plate carried by the bar and adapted to bear against the side of the cheese, and a knife pivoted to the stationary platform.

701,925. TROLLEY-CROSSOVER. THOMAS NORTH, ARDEN, Ill. assignor to Wheeler Manufacturing Company, Arden, Ill., a Corporation of Illinois. Filed Sept. 4, 1901. Serial No. 74,590. (No model.)

Claim.—1. The combination with the plate *A* having depending sides *a* and intermediate ribs *c*, of means for attaching at one end a trolley-wire, and a springing rod *d* located near the opposite end of the plate between the ribs *c* and held in place by a pin *e* passing through it and through said ribs, substantially as specified.

2. The combination with the plate *A* provided with ribs *c*, of means for attaching at one end a trolley-wire, and a springing rod located near the opposite end of the plate between the ribs *c* and held in place by a pin *e* passing through it and through said ribs, substantially as described.

3. In combination, a plate having a socket at one end adapted to receive a trolley-wire, ribs integral with the plate, a rod, and a pin passing through the rod and ribs for pivotally connecting the former to the latter.

4. In combination, a plate, ribs integral therewith, means for attaching one end of a trolley-wire to the plate, a springing rod, and means for pivotally connecting the rod between the ribs.

701,926. TUBE-DRAWING GRIP. HENRY OVERMANN, Toledo, Ohio. Filed June 12, 1901. Serial No. 64,525. (No model.)

Claim.—1. A tube-drawing grip comprising an expandable sleeve formed of a plurality of sections held assembled around a pull-rod by an annular spring, the sleeve so formed having an external diameter to freely enter the open end of a tube and provided with exterior corrugations and internal conical counterbores at both ends, a central pulling-pipe on the rear end of the pull-rod, tapered to enter the conical bore of one end of the grip-sleeve, a plug-sleeve mounted upon the pull-rod and movable thereon, and provided with a conical shoulder to enter the conical bore of the opposite end of the grip-sleeve, and means mounted upon the pull-rod to simultaneously urge the plug-sleeve and the pulling-pipe into the conical counterbores of the grip-sleeve, to expand it to grip the tube.

2. In an internal grip for tube-drawing, the combination with a pull-rod, provided with a conical pulling-head at the rear end, and with a shoulder adjacent thereto, of a plug-sleeve movably mounted on the rail between the head and the shoulder, having a conical shoulder facing the conical pulling-head, an expandable grip-sleeve mounted on the pull-rod between the pulling-head and plug-sleeve, comprising a plurality of sections held yieldingly assembled by an annular spring around the circumference of the sleeve, the grip-sleeve being provided with internal corrugations for a portion of its length and with a conical counterbore at each end, adapted to receive the conical pulling-head at one end and the conical shoulder of the plug-sleeve at the other, a collar movably mounted on the pull-rod between the plug-sleeve and the rod-shoulder, and a lever pivotally mounted on the collar, having cams adapted to simultaneously engage the front end of the plug-sleeve and the rod-shoulder, and to force the plug-sleeve and pull-rod in opposite directions by the throw of the lever, substantially as shown and described, and for the purpose set forth.

3. In an internal grip for drawing tubes, the combination of a plurality of complementary longitudinal sections forming, when assembled, a conical tubular sleeve having an internal conical counterbore at each end, and external annular corrugations for a part of its length, and a reduced diameter for the remainder of its length, the reduced portion being provided with an internal annular groove, and an annular spring in the groove around the sections, adapted to yieldingly hold them assembled, substantially as shown and described, and for the purpose set forth.

701,927. MINE-EXPLOSION-APPARATUS. JOHN PAULI, Hoboken, N. J., assignor to the Knott & Burr Company, a Corporation of New Jersey. Filed Dec. 2, 1901. Serial No. 64,600. (No model.)

Claim.—1. In a mine-explosion-apparatus, the combination with a chamber, of a magnet-tray in said chamber composed of a plurality of parts one of which parts is mounted to be adjusted circumferentially on and relatively to another, a frame mounted on said adjustable part and provided with a plurality of tubes having means by which one end of each of the same may be opened and closed, magnets in said tubes, a threaded adjusting-rod extending through said tray, and means for adjusting said tray relatively to said rod, comprising a sleeve carried by the tray and threaded upon said rod and an actuating means for said rod extending to an easily-accessible place.

2. In a mine-explosion-apparatus, the combination with a tube and a heating-magnet therein, of a magnet-tray, composed of a plurality of parts of which one is mounted to be adjusted circumferentially with respect to another, magnets carried by said adjustable part and means for adjusting said tray and the latter magnets vertically, said adjusting means being independent of the tube of the heating-magnet.

3. In a mine-explosion-apparatus, the combination with a tube and a heating-magnet therein, of a magnet-tray; means for adjusting said tray relative to said tube, said adjusting means comprising a threaded rod, means for rotating the same and a sleeve extending from the tray and threaded upon said rod; said tray being composed of a plurality of parts of which one is adjustable circumferentially relative to another; and magnets carried by the latter part.

4. In combination with a heating-magnet, a suspending means therefor embracing chain-pulley mounted upon a rotatable bracket on the wall of the magnet-chamber, the bracket being provided with ears or steps whereby its rotation in a downward direction beyond a predetermined horizontal plane is prevented.

5. In a mine-explosion-apparatus, the combination of two magnet-carrying trays one of which has an opening into or through which the other may pass, and means for adjusting said magnet-carrying trays relative to each other.

1. A mitten constructed of a single piece of material and consisting of two portions having their lower ends straight and their upper ends semicircular, one of said portions having a recess, a thumb-piece having a rounded outer end, and a thumb-flap having a rounded outer end and integrally united to the thumb-piece at the inner margin of the latter, and having a rounded inner end produced in the formation of said recess, the other portion having a recess to receive the inner rounded end of said flap and a projection to enter the recess of the first-named portion, stitches uniting the edges of said portions from their lower margins to the meeting points of said thumb-piece and flap, stitches uniting the rounded inner end of the thumb-flap to the portion containing the recess in which the rounded inner end of said thumb-flap fits, and stitches uniting the edges of said portions around their semicircular ends and around the projection and recess to the junction with the thumb, all arranged substantially as and for the purpose set forth.

701,989. WINDOW-SCREEN. JOHN E. RANKIN, Verona, N. J. Filed Jan. 14, 1902. Serial No. 86,126. (No model.)

Claim.—1. The combination with a window, of a screen arranged on the exterior of the window and extending from the top to the bottom thereof, a roll arranged at the top of the window and receiving the screen and adapted to have the same wound on it, an operating-cord reversely wound on the roll and adapted to be drawn outward to wind up the screen, a belt mounted on the window at the bottom thereof and extending through an opening of the bottom of the screen and provided with a notch engaged by the said screen whereby the belt is prevented from being forced inward from the exterior when the screen is under tension, and means for securing the cord under tension, substantially as described.

2. The combination with a window, of a screen arranged on the exterior of the window and extending from the top to the bottom thereof, a roll arranged at the top of the window and receiving the screen and adapted to have the same wound on it, a movable locking device engaging the screen at the bottom of the window, an operating-cord reversely wound on the roll and adapted to be drawn outward to wind up the screen, and means mounted on the interior of the window for holding the oper-

ating-cord under tension, whereby the bottom of the screen will be positively maintained in engagement with the locking device to prevent the latter from being operated from the exterior of the window, substantially as described.

701,988. WAGON. RICHARD B. RAYMOND, Detroit, Mich., assignor to William G. Raymond, Charles E. Smith, and Samuel E. Smith, Detroit, Mich. Filed June 4, 1902. Serial No. 561,000. (No model.)

Claim.—1. The wagon having a front axle swivelled upon a king-bolt located in the rear of the axle, and also having a roller supported in the axle and adapted to sustain the weight of the wagon-body, substantially as specified.

2. The four-wheeled roadless wagon having a front axle swivelled upon a king-bolt located in the rear of the axle, and secured in the box or platform, and having its box or platform extended over and supported upon the front axle and also fixed to and incapable of vertical movement on the rear axle, substantially as specified.

3. The four-wheeled roadless wagon the box or platform whereof is rigidly attached to the rear axle, and is also joined to the front axle by a king-bolt located in the rear of the latter, the box or platform being supported from the front axle by a pivoted roller carried on that axle, substantially as specified.

4. The roadless wagon having its front axle swivelled upon a king-bolt located in the rear of the axle, and also having a roller pivoted in the axle and adapted to sustain the weight of the body, substantially as specified.

5. The wagon wherein are combined the front axle, the plate or frame F, the roller let into the axle and plate, and means for supporting the roller and attaching the plate or frame to the axle, substantially as specified.

6. The wagon wherein are combined the swivelled front axle, the king-bolt located back of the axle, plate or frame F, the yoke f and beams f' joined to the axle, substantially as specified.

7. The combination in an axle of a wide wood body, parallel transverse, and a roller G let into the body at the central longitudinal plane thereof, substantially as specified.

8. The combination of the wagon-body having the side standards U, of the rear axle, and the bolts extending from the axle and engaging said standards, substantially as specified.

9. The combination of the wagon-body having the side standards U, of the rear axle, and the bolts extending from the axle and detachably engaging said standards, substantially as specified.

10. The combination of the wagon-body having three or more standards U upon each side, of the rear axle and bolts T, T', extending from

the axle to the standards and having their ends fashioned to detachably engage said standards, substantially as specified.

11. The combination of the wagon-body having the side standards U, of the rear axle, the plate V, and the bolts passing through said plate and engaging said standards, substantially as specified.

701,984. TUFF-YARN SPOOL FOR TUFTED-FIRE-FABRIC. LOUISA JEAN F. KIDNEY, Clinton, Mass. Filed Mar. 11, 1901. Serial No. 59,800. (No model.)

Claim.—1. In a construction for supplying differently-colored yarns to a loom for weaving tufted fabric, the combination of spool-sections having yarns supplied from the same yarn ends wound upon each of said spool-sections, so that said sections will have the same sequence of colors thereon, said sections being connected together so as to be independently rotatable.

2. In a construction for supplying differently-colored yarns to a loom for weaving tufted fabric, the combination of two independently-rotatable spool-sections having yarns of the same sequence of colors wound thereon, said spool-sections being journaled in line with each other, so that the color sequences on said spool-sections will be symmetrical with respect to the adjacent ends of the spool-sections, and said spool-sections being arranged to turn in opposite directions when supplying yarns for a design symmetrical with respect to its center line, substantially as described.

3. In a construction for supplying differently-colored yarns to a loom for weaving tufted fabric, the combination of spool-sections, a device for connecting said spool-sections so that they may rotate or turn independently of each other, and spool-heads adapted to be detachably connected to the ends of the spool-sections, substantially as described.

4. In a construction for supplying differently-colored yarns to a loom for weaving tufted fabric, the combination of spool-sections, a device for connecting the spool-sections, detachable heads having spindles fitting into the sockets in the ends of the spool-sections, and split spring-rings fitted into the spool-sections for engaging grooves in the connecting-device and spool-head spindles to detachably secure the parts together, substantially as described.

701,985. REGISTER. RICHARD C. KENNEDY, Lexington, N. C. Filed Apr. 14, 1902. Serial No. 102,994. (No model.)

Claim.—1. A defter-register for spinning-frames, comprising a casing having a vertically-disposed passage, a receiving-chamber in communication with the upper end of said passage, a ball-feed tube communicating with said passage, and a vertically-disposed rod guided in said passage, said rod having an operative connection with the ring-roll-actuating mechanism.

2. The combination with a spinning-frame including a ring-roll and its actuating mechanism, of a registering device comprising a casing hav-

ing a vertically-disposed passage provided with a ball-out, a ball-supply tube in communication with said passage at a point above the ball-out, registering-balls in said tube, a receiving-chamber in communication with the upper end of the vertical passage, and a vertically-disposed rod guided in said passage, said rod having an operative connection with the ring-roll-actuating mechanism.

3. The combination with a spinning-frame including a ring-roll and its actuating mechanism, of a registering device comprising a casing having a vertically-disposed passage provided with a ball-out, a ball-feed tube in communication with said passage at a point directly above the ball-out and so situated that a ball supported on the cast will prevent the passage of a succeeding ball from the tube, a receiving-chamber in communication with the upper end of said passage, the bottom of said chamber being situated at a point below the open top of the passage, and a vertically-disposed rod guided within said passage, said rod having an operative connection with the ring-roll-actuating mechanism, and its upper end being movable to a point below the valve-out each time the ring-roll is moved to drafting position.

4. A registering device comprising a casing having a vertically-disposed passage provided with a ball-out, a ball-feed tube in communication with a ball-receiving chamber, a ball-feed passage opening into the vertical passage at a point immediately above the ball-out, registering-balls, and a vertical rod disposed within the vertical passage, said rod having a reciprocating movement from a point below the ball-out to a point above the upper end of the vertical passage, substantially as specified.

701,986. SPOUT FOR FLOUR-SEIFERS. RICHARD C. KENNEDY, Northwood, Iowa. Filed Jan. 11, 1902. Serial No. 59,801. (No model.)

Claim.—1. A spout for flour-seifers, comprising a plurality of inflexible tubular sections, and flexible joint members, of double conical form connecting the inflexible tubular sections together, substantially as described.

2. In a flour-seifer spout, the combination of a flexible joint member comprising a pair of truncated conical sections of flexible material having their bases joined together and inflexible tubular sections having their ends secured to the truncated portions of the flexible sections, substantially as described.

3. In a flour-seifer spout, the combination of a flexible joint member comprising a pair of truncated conical sections of flexible material having their bases joined together and having their truncated portions provided with collars, and inflexible tubular sections having their ends secured in the said collars, substantially as described.

4. In a flour-seifer spout, the combination of a flexible joint member comprising a pair of truncated conical sections made of leather, having their bases joined together and provided at their truncated portions with collars, and inflexible tubular sections having their ends secured in the said collars, substantially as described.

5. A flour-seifer spout comprising a plurality of inflexible tubular sections and flexible non-collapse joint members in which the opposing ends of the inflexible tubular sections are attached, the said flexible non-collapse joint members being of greater diameter than said tubular sections at points intermediate the ends of the latter, substantially as described.

701,987. INDICATING INSTRUMENT. LEWIS T. KENNEDY, Schenectady, N. Y., assignor to the General Electric Company, a Corporation of New York. Filed Nov. 20, 1900. Serial No. 737,006. (No model.)

Claim.—1. As a means of producing restoring torque in an indicating instrument, a strip of magnetic material magnetized above the head of the sinusoidal curve.

2. The combination in an electrical measuring instrument of a field-magnet, a deflecting mechanism, and a thin strip of magnetic material magnetized above the head of the sinusoidal curve.

2. The combination in an electrical measuring instrument of a field-magnet, a deflecting mechanism, and a thin strip of magnetic material too small to seriously distort the field.

4. The combination in an electrical measuring instrument of a field-magnet, a deflecting mechanism, and a thin strip of magnetic material proportioned so as to cause a distortion of the field so small that its variation with variation in flux will not seriously affect the reading of the instrument.

5. In an electrical measuring instrument, the combination of a field-magnet structure, a deflecting-coil, and a strip of magnetic material working in the field of the magnet, the said strip being thin and of such a width as to present an air-gap between the strip and the magnet large in proportion to the width of the strip.

6. A magnetic returning device for instruments, consisting of a body of non-magnetic metal, wholly or partially covered with magnetic metal.

7. In an electric measuring instrument, the combination of an electro field-magnet, a coil traversed by current from the circuit to be measured, a piece of magnetic material having a support in common with the coil, and acted upon by the same source of flux as the coil, for returning the moving system to zero when current ceases to flow in the coil, and a piece of good conducting material carried by the moving system to damp the oscillations.

8. In an electric measuring instrument, the combination of a pair of iron field-magnets forming an astatic couple, pole-pieces for the magnets separated from each other by small air-gaps, a flat coil mounted for movement between the pole-pieces, and a piece of iron located within the interstices of the pole-pieces for returning the moving coil to zero.

9. In an electric measuring instrument, the combination of two iron field-magnets arranged to form an astatic couple, pole-pieces for the magnets, separated by a small air-gap, a coil mounted on a shaft and at an angle thereto, and adapted to move between the pole-pieces, a magnetic return mechanism mounted on the coil-shaft and acted upon by the same magnets which move the coil, the arrangement of parts being such that the portion of the field-flux tending to move the coil is greater than the portion of the field-flux acting upon the magnetic return mechanism.

10. In an electric measuring instrument, the combination of a moving coil mounted on a shaft, a pair of field-magnets arranged to form an astatic combination, and situated with their poles above and below the moving coil and in close proximity thereto, and a magnetic return mechanism, situated between the pair of field-magnets, and acted upon by a flux which is at right angles to the main field-flux; the arrangement being such that both the coil and magnetic return mechanism are correspondingly acted upon by changes in field strength.

11. In an electric measuring instrument, the combination of a pair of iron field-magnets arranged to form an astatic combination, conical pole-pieces for the magnets, a coil mounted at an angle to its supporting-shaft, and moving between the pole-pieces, a magnetic return mechanism located between the pair of poles for returning the moving system to zero, and means for directing a portion of the field-flux so that it will pass through the magnetic return mechanism.

12. In an electrical measuring instrument, the combination of a pair of field-magnets arranged to form an astatic combination, a motor mechanism situated in one portion of the field, and a magnetic return mechanism situated in another portion of the field, the strength of which differs from the first-mentioned portion; the arrangement of parts being such that the motor and return mechanism are correspondingly acted upon by changes in field strength.

13. In an ammeter, a moving coil carried in series with the main current and a field-coil having means carried in multiple with the main current and a magnetic return piece for the moving coil.

14. In an electric measuring instrument, the combination of a pair of magnets united to form an astatic combination, a coil system mounted for movement between the poles of both magnets, and a magnetic return mounted for movement in the flux between the magnets the moving coil and magnetic return being alike subject to changes in strength of the field-magnet.

15. In an electric measuring instrument, the combination of a pair of magnets united to form an astatic combination, a moving coil system mounted for movement between the poles of both magnets, and a pair of magnetic return-strips, one of which is situated above the coil and the other below the coil, for returning the coil to its initial position; the field-flux in which the said return-strips are located being subjected to changes corresponding to those in the field-magnet.

16. In an electric measuring instrument, the combination of a magnet, a moving-coil system mounted for movement between the poles of the magnet, a shaft for supporting the moving-coil system, and magnetic return-strips for returning the moving system to zero, which are mounted in slots cut in the coil-shaft.

17. In an electric measuring instrument, the combination of a magnet, a coil system mounted for movement between the poles of the magnet, a damping-disk situated between the coil and the pole-face of the magnet, which extends beyond the outer periphery of the pole-face, and a magnetic return mechanism for the moving coil.

18. In an electric measuring instrument, the combination of a pair of magnets united to form an astatic combination, a coil system mounted for movement between the poles of both magnets, damping-disks situated between the coil and the pole-faces, which extend beyond the pole-faces at all points, and a magnetic return mechanism for the moving coil.

19. In an electric measuring instrument, the combination of a pair of magnets united to form an astatic combination, each magnet comprising two parallel cores with conical pole-pieces for the cores.

20. In an electric measuring instrument, the combination of a pair of magnets united to form an astatic combination, each magnet comprising two parallel cores with conical pole-pieces for the cores, and an energizing-coil wound on each core.

21. In an electric measuring instrument, the combination of a pair of electromagnets united to form an astatic combination, a coil mounted for movement between the poles of both magnets, parallel cores for each magnet, energizing-coils for the magnets, detachable conical pole-pieces for the cores, and classified portions on the cores, so arranged that they direct the direction of the field-flux.

701,988. THREAD-STARTING MECHANISM FOR LOOMS. GRAS F. BARN, Bepaisin, Mass., assignor to Ingers Company, Bepaisin, Mass., a Corporation of Maine. Filed Jan. 9, 1902. Serial No. 22,974. (No model.)

Claim.—1. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, means to act upon the thread of the filling-supply to be abandoned and clamp it at the shuttle, and means operative upon replenishment of filling to part the thread so clamped.

2. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, means to clamp against the shuttle the thread of the filling-supply to be abandoned, and a thread-parting operative upon replenishment of the filling to part the thread so clamped.

3. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, means to clamp, at the shuttle, the thread of the filling-supply to be abandoned, and means bodily movable upon replenishment of filling into position to successively hold and part the thread so clamped.

4. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, the lay, a shuttle-box thereon, a clamp to automatically engage and hold the thread by or through entry of the shuttle into the box, to maintain the thread taut, and a thread-parting operative upon replenishment of filling to part the thread while it is maintained taut.

5. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, the lay, a shuttle-box thereon, having an open-

tured front wall, a friction-clamp to automatically engage the filling-thread through the aperture and clamp it against the shuttle when the latter enters the box, to maintain the thread taut, and means operative upon filling replenishment to part the thread while it is maintained taut.

6. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, the lay, a shuttle-box thereon, a spring-controlled friction-pad to engage and clamp the thread against the side of the shuttle when the latter enters the box, to maintain the thread taut between the shuttle and the cloth, and a thread-parting movable into position to part the thread upon filling replenishment.

7. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, the lay, a shuttle-box thereon, having an aperture front wall, a spring-controlled friction-pad mounted on the latter and adapted to enter the aperture and clamp the thread against the shuttle when taut, to maintain the thread taut, and a thread-parting to part the thread upon filling replenishment.

8. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, the lay, a shuttle-box thereon, a spring-controlled device to act upon the thread of the filling-supply to be abandoned and hold it against the shuttle when the latter is taut, to maintain the thread taut, a thread-parting and a thread-clamp, arranged in juxtaposition and movable upon filling replenishment into position to act upon the thread, and means to maintain the clamp and thereafter the parting, to part the thread between the clamp and the holding device.

9. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, the lay, a shuttle-box thereon, and means operative when the shuttle enters the box to hold the thread against the shuttle and maintain the thread taut between the shuttle and the cloth.

10. In an automatic filling-replenishing loom, a shuttle adapted to contain a supply of filling, means to hold, at the shuttle, the thread of the filling supply to be abandoned, means operative upon filling replenishment to part the thread while maintained taut, and a thread-clamp to engage the thread between the cloth and the thread-parting.

11. In an automatic filling-replenishing loom, a temple thread-cutter, means to clamp the thread against the shuttle when the latter is taut, and thereby maintain the thread taut between the shuttle and the cloth, a thread parting and clamping device operative upon filling replenishment to clamp the thread and part it, the return of said device to normal position carrying the thread off held thereby, into the range of the temple thread-cutter, and means to effect movement of said device into and out of operative position.

12. In a loom provided with automatic filling-replenishing mechanism, a temple thread-cutter, means to act upon the thread of the filling-supply to be abandoned, to clamp and part the thread near the shuttle and thereafter to bring the thread while clamped into the range of the temple thread-cutter, and a thread-clamp to hold the piece of filling when parted by the latter, said thread-clamp comprising opposed jaws one of which is longitudinally movable relative to the other, means to intermittently effect such relative movement of the jaws, the latter having roughened opposed faces and smooth, facing entrance ends, and a guard at the entrance of said jaws to prevent premature entrance of the thread therebetween.

13. A thread-cutter for automatic filling-replenishing looms, comprising two opposed jaws relatively movable in the direction of their length, a support for the lower jaw upon which it can tilt, the upper jaw resting on the lower jaw, and means to effect relative longitudinal movement of the jaws.

14. In a thread-cutter for automatic filling-replenishing looms, a fixed support, a lower jaw mounted thereupon to tilt and having a roughened upper surface, an opposed upper jaw having its under surface roughened and resting upon the lower jaw, and means to engage the upper jaw and move it longitudinally.

15. In a thread-cutter for automatic filling-replenishing looms, a fixed support having longitudinally-movable raised sides forming a thread-guard at one end, a lower jaw mounted to tilt on said support between the raised sides thereof, an upper jaw resting on the lower jaw, and means to move said upper jaw longitudinally, the entrance ends of the jaws being faced adjacent to the thread-guard.

701,989. BOLLER. JAMES F. BELL, Bakers, Iowa. Filed July 4, 1901. Serial No. 27,321. (No model.)

Claim.—The combination with the shell of a boiler, the lower or inner surface thereof forming the upper part or covering of the fire-box underneath said boiler, a smoke-chest at the end of said boiler over the fire-box, flues connecting said smoke-chest with a space or compartment at the opposite end of said boiler, of a fire-box under one end of said boiler, a shallow chamber of the same shape as the lower part of the boiler covering the lower circumference of the boiler and freely communicating with the fire-box and space in front of the boiler, a water-chamber underneath

said shallow chamber extending upon the sides of the boiler and around said fire-box, said water-chamber having free communication with the water-space of the boiler through openings in the sides thereof, substantially as described.

701,940. COIN-CONTROLLED MACHINE. WILLIAM W. BOWEN, New York, N. Y., assignor to the Remond Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Aug. 12, 1901. Serial No. 94,692. (No model.)

Claim.—1. The combination with an operating-slide, of a delivery-slide actuated by the pressure of the operating-slide transmitted through a coin interposed between the two, a yielding support along which the coin is moved by the slide during the delivery movement of the delivery-slide, said support being provided with a stop preventing the passage of the coin during the delivery movement but preventing retrograde movement thereof, means opposed to the support for engaging the edge of the coin to hold it in engagement with the support and adapted to engage the face of a wider coin to prevent operation of the machine, and connections between the two slides for returning the delivery-slide to normal position after the operating-slide is partially returned, whereby the pressure of the two slides upon the coin is released before the return of the delivery-slide, substantially as described.

2. The combination with an operating-slide, of a delivery-slide actuated by the pressure of the operating-slide transmitted through a coin interposed between the two, a yielding support along which the coin is moved by the slide during the delivery movement of the delivery-slide, said support being provided with a series of steps permitting the passage of the coin during the delivery movement but preventing retrograde movement thereof, means opposed to the support for engaging the edge of the coin to hold it in engagement with the support and adapted to engage the face of a wider coin to prevent operation of the machine, and connections between the two slides for returning the delivery-slide to normal position after the operating-slide is partially returned, whereby the pressure of the two slides upon the coin is released before the return of the delivery-slide, substantially as described.

3. The combination with an operating-slide, of a delivery-slide actuated by the pressure of the operating-slide transmitted through a coin interposed between the two, a pocket in the delivery-slide for receiving the coin, a support along which the coin is moved by the slide during the delivery movement of the delivery-slide, said support being provided with a slit in the wall with the pocket for the passage of a thin coin and with a stop projecting into the path of movement of the coin and adapted to be depressed thereby during the delivery movement and to then return to normal position to prevent retrograde movement of the coin, and con-

connections between the two slides whereby the delivery-slide is returned to normal position by the operating-slide, substantially as described.

4. The combination with an operating-slide, of a delivery-slide actuated by the pressure of the operating-slide transmitted through a coin interposed between the two, a pocket in the delivery-slide for receiving the coin and open at its rear end for the discharge of a narrow coin, a support along which the coin is moved by the slides during the delivery movement of the delivery-slide, said support being provided with a slit in line with the coin-pocket for the passage of a thin coin and with a stop projecting into the path of movement of the coin and adapted to be depressed thereby during the delivery movement and to then return to normal position to prevent retrograde movement of the coin, and connections between the two slides whereby the delivery-slide is returned to normal position by the operating-slide, substantially as described.

5. The combination with an operating-slide, of a delivery-slide actuated by the pressure of the operating-slide transmitted through a coin interposed between the two, a pocket in the delivery-slide for receiving the coin, a yielding support along which the coin is moved by the slides during the delivery movement of the delivery-slide, said support being provided with a slit in line with the coin-pocket for the passage of a thin coin and with a stop permitting the passage of the coin during the delivery movement but preventing retrograde movement thereof, means opposed to the support for engaging the edge of the coin to hold it in engagement with the support and adapted to engage the face of a wider coin to prevent operation of the machine, and connections between the two slides whereby the delivery-slide is returned to normal position by the operating-slide, substantially as described.

6. The combination with an operating-slide, of a delivery-slide actuated by the pressure of the operating-slide transmitted through a coin interposed between the two, a pocket in the delivery-slide for receiving the coin and open at its rear end for the discharge of a narrow coin, a yielding support along which the coin is moved by the slides during the delivery movement of the delivery-slide, said support being provided with a slit in line with the coin-pocket for the passage of a thin coin and with a stop permitting the passage of the coin during the delivery movement but preventing retrograde movement thereof, means opposed to the support for engaging the edge of the coin to hold it in engagement with the support and adapted to engage the face of a wider coin to prevent operation of the machine, and connections between the two slides whereby the delivery-slide is returned to normal position by the operating-slide, substantially as described.

7. The combination with delivery-slides *a* and operating-slide *c*, of guide-rod *b* passing through the delivery-slide outside the normal path of the coin, but forming a stop for a piece projecting above said path, and coin-supporting yielding table *t* in line with the path of movement of the delivery-slides, substantially as described.

8. The combination with delivery-slides *a*, operating-slide *c*, and the coin-pocket between said slides, of a stop on the coin-receiving side of the coin-pocket and outside the normal path of a coin moving with the delivery-slides, and coin-supporting yielding table *t* in line with the path of movement of the delivery-slides, substantially as described.

9. The combination of an operating member acting through a coin, of a hinged yielding table having an inclined stop and also a slot 23 for a thin coin, substantially as described.

10. The combination with stationary bar 13, of hinged table *t* arranged with slot 23 between the rear edge of the table and the bar, substantially as described.

701,941. SCREW-DRIVER. RUSSELL G. BOWLANN, Boston, Wis. Filed June 26, 1891. Serial No. 69,547. (No model.)

Claim.—1. In a screw-driver, the combination with a rotatable stem having a beveled point, of an external sleeve rotatably embracing the stem, terminated short of the point thereof and fixed against endwise movement toward the point of the stem whereby the sleeve forms a handle for guiding the stem, and an inner endwise-slidable sleeve, which is spring-pressed and has its outer end provided with a screw-head cast, said inner sleeve being yieldingly connected with the external sleeve and arranged to be received wholly within the same.

2. In a screw-driver, the combination with a rotatable stem having a beveled point, of an external sleeve rotatably embracing the stem, terminated short of the point thereof and fixed against endwise movement toward the point of the stem and thereby forming a relatively fixed handle for guiding the stem, there being a longitudinal slot formed in the sleeve, an inner spring-pressed endwise-slidable sleeve mounted within the sleeve and embracing the stem, the outer end of the inner sleeve being provided with a screw-head cast, said inner sleeve normally projecting beyond the external sleeve and adapted to be depressed wholly within the same, and a guide-pin carried by the inner sleeve and work-

ing in the slot of the outer sleeve, the projected end of the pin forming a finger-piece for adjusting the inner sleeve.

3. In a screw-driver, the combination with a rotatable stem, having a beveled point, and a marginal shoulder, of an external sleeve rotatably embracing the shoulder and terminated short of the point of the stem, a cap applied to the inner end of the sleeve and rotatably embracing the shoulder, there being a longitudinal slot formed in the outer end portion of the sleeve, an inner sleeve mounted to slide endwise upon the stem and within the outer sleeve, the outer end of the inner sleeve having a conical screw-head cast, a coiled spring embracing the stem and bearing in opposite directions against the shoulder on the stem and the inner end of the inner sleeve, and a beveled pin projected outwardly from the inner sleeve and working in the slot in the outer sleeve.

4. The combination with a screw-driver bit, of a bit-centering sleeve in which the bit is revolvably mounted and in which it is axially movable, a second sleeve having a limited forward movement with relation to the bit, said bit-centering sleeve normally projecting beyond the other sleeve and capable of being received wholly within the latter, and connections between the sleeves for limiting the movement of the centering-sleeve with relation to the second sleeve.

5. The combination with a screw-driver bit, of a spring-advanced bit-centering sleeve in which the bit is revolvably mounted and in which it is axially movable, a second sleeve embracing the bit-centering sleeve and having a limited forward movement with relation to the bit, said bit-centering sleeve normally projecting beyond the other sleeve and capable of being received wholly within the latter, and connections between the sleeves for limiting the movement of the centering-sleeve with relation to the second sleeve.

6. The combination with a screw-driver bit of a spring-advanced bit-centering sleeve in which the bit is revolvably mounted and in which it is axially movable, a second sleeve having a limited forward movement with relation to the bit, said bit-centering sleeve normally projecting beyond the other sleeve and capable of being received wholly within the latter, and means for indicating the axial position of the centering-sleeve with relation to the second sleeve.

7. The combination with a screw-driver bit, of a spring-advanced bit-centering sleeve in which the bit is revolvably mounted and in which it is axially movable, a second sleeve having a limited forward movement with relation to the bit, and a limiting and indicating connection between said sleeves, for determining the limit of the axial movement of the centering-sleeve independently of the second sleeve, and also for indicating the relative positions of said sleeves, said bit-centering sleeve being normally projected beyond the second sleeve.

8. The combination with a screw-driver bit of a spring-advanced bit-centering sleeve in which the bit is revolvably mounted and in which it is axially movable, a grip including and housing the centering-sleeve, said centering-sleeve normally projecting beyond the grip and held from independent rotary movement while capable of independent axial movement with relation thereto, and a gauge carried by the bit-centering sleeve for indicating the position of the centering-sleeve with relation to the grip.

701,942. DISPLAY-HOLDER FOR SECTIONS. HENRY BROWN, Chicago, Ill. Filed Feb. 7, 1902. Serial No. 13,022. (No model.)

Claim.—1. A necktie display-holder in which is combined a common support, a plurality of sheet-metal standards each having a flat base, means for permanently securing the same to said common support, each of said standards consisting of a flat upwardly-projecting body portion integral with and inclined at an oblique angle to said base, said body having flanges or wings bent laterally from opposite sides or edges toward each other and folded substantially parallel to the inclined portion from which they are bent whereby an opening, oblong in cross-section may be formed between said parallel portions for the reception of the article to be supported thereby.

2. As an improved article of manufacture, a necktie display-holder formed from sheet metal, said holder having a base, an upwardly-extended body bent at an oblique angle thereto, said body being provided with a necktie at its upper end oblong in cross-section, formed by the lateral bending of the metal from opposite edges thereof open back.

3. In a necktie display-holder, the combination with a main support such as a card or box, of a sheet-metal standard having a flat base, means for permanently attaching said base to said support, said standard consisting of a flat body portion bent upwardly from one end of and inclined at an oblique angle to said base, provided with wings or flanges bent from opposite edges toward each other and hinged between said inclined body and base, said wings being formed from said inclined wings substantially as and for the purposes specified.

701,943. FILTER-FAUCET. JOHN F. RYAN, Brooklyn, and WILLIAM McILWAIN, Winfield, N. Y., assignors to Arthur H. Ryan, Atlantic City, Pa. Filed June 26, 1901. Serial No. 69,522. (No model.)

Claim.—1. In a filter-faucet, the combination of a filtering medium, a rotary spindle and a plurality of valves or washers carried by the rotary spindle and arranged on opposite sides of an annular diaphragm provided with valve-seats on opposite sides thereof.

2. In a filter-faucet, the combination of inlet and delivery ports, a filtering medium and a spindle carrying the said filtering medium and provided with a plurality of washers and valve-seats intervening between the washers.

3. In a filter-faucet, the combination of a cylindrical filtering medium, a winged spindle passing therethrough and provided with openings for the passage of water from the interior of the filtering medium.

4. In a filter the combination of a spindle provided with a plurality of washers, valve-seats intervening between the washers and a ferrule adapted to space the said washers apart.

5. In a filter the combination of a filtering medium, a spindle carrying the said filtering medium, a plurality of washers carried by the spindle and valve-seats intervening between the said washers.

6. In a filter the combination of a filtering medium, a plurality of

valve-seats and a plurality of washers, the said valve-seats intervening between said washers and a ferrule also intervening between the said washers.

7. In a filter-faucet the combination of a hollow filtering medium, a spindle carrying the said filtering medium, a plurality of washers or valves carried by the said spindle, valve-seats intervening between the said washers and openings adapted to accommodate the flow of water, irrespective of the position of the washers with respect to their valve-seats.

701,944. EXHAUST-VALVE FOR INTERNAL-COMBUSTION ENGINES. JOHN SALZAR, JR., Philadelphia, Pa. Filed Sept. 19, 1900. Serial No. 10,554. (No model.)

Claim.—In an internal-combustion engine, the combination of an exhaust-valve; a casing; a cylindrical extension-chamber mounted on the valve and projecting through the casing, said extension-chamber being open to the atmosphere; a hollow valve-stem whose interior communicates with the interior of the extension-chamber; means for supplying water to one end of the conduit formed by the extension-chamber and the hollow valve-stem; and means for discharging water at the other end of said conduit, whereby a direct passage of water through said conduit in one direction only is effected, substantially as set forth.

701,945. CAR-FENDER. BENJAMIN A. SANDER, Fredericktown, Mo. Filed Jan. 14, 1902. Serial No. 69,602. (No model.)

Claim.—1. A car-fender comprising a fender-frame provided with rearwardly-extending arms, a cross-bar adapted to bear upon the rear ends of said arms, a longitudinal movable tripper carried by the fender-frame, a lever to which the rear end of the tripper is pivotally connected, means for normally holding the cross-bar upon the rearwardly-projecting arms of the fender, and means for releasing the same, substantially as described.

2. In a car-fender the combination with the fender-frame having the rearwardly-projecting arms, of the dotted sleeve carrying a plunger, the spring-extended cross-bar, the longitudinal movable tripper, the lever to which the said tripper is attached and means connected with the said lever for releasing the cross-bar, substantially as described.

3. In a car-fender, the combination with a fender-frame having rearwardly-extending arms, of the sleeve having bayonet-slot therein, the plunger working in the sleeve through the upper end, the cross-bar having a shank working in the sleeve from the lower end, a finger working in the slot of the sleeve, a longitudinal movable tripper carried by the fender, a lever to which the rear end of the tripper is attached, said finger being pivotally connected to the said lever, substantially as described.

4. In a car-fender, the combination with the dotted sleeve, of the plunger working therein from the upper end, the cross-bar having a shank working therein from the lower end, springs connected to the cross-bar, the rearwardly-extending fender-arms upon which the cross-bar bears, the depending lever pivotally connected at its lower end to a tripper, a finger carried by the said shank and working in the dotted sleeve, and the lever pivoted between the sleeve and depending lever, and having a

curved lower end adapted to contact with the finger, substantially as shown and described.

5. In a car-finder, the combination with a finder-frame having rearwardly-extending arms, of the sleeve having a straight and a bayonet slot produced therein, a plunger working in the sleeve in the upper end, a cross-bar having a shank working in the sleeve from the lower end, a guide-finger attached to said shank and movable in the straight slot, a locking-pin movable upon the shank and adapted to engage the bayonet-slot of the sleeve, a longitudinally-movable tripper carried by the finder, a lever to which the rear end of the tripper is attached, said locking-pin being pivotally connected to the said lever, substantially as described.

6. In a car-finder, the combination with the sleeve having straight and bayonet slots, of the plunger or push-rod working therein from the upper end, the cross-bar having a shank working therein from the lower end, said shank and push-rod being connected, a guide-pin rigidly connected to the shank and working in the straight slot of the sleeve, a locking-pin movable vertically with the shank and transversely thereon, said locking-pin working in the bayonet-slot of the sleeve, springs connected to the cross-bar, the rearwardly-extending finder-arms upon which the cross-bar bears, the depending lever pivotally connected to the locking-pin, the forwardly-projecting tripper-arms connected at their rear ends to the lower end of the depending lever, said tripper-arms carrying the front cross-bar, and the foot-lever pivoted between the sleeve and the depending lever, the lower end thereof being adapted to contact with the locking-pin, substantially as set forth.

701,946. TILTING WATER-GRADE. HOWARD DE WOLFE LAWYER, Boston, Mass. Filed July 8, 1897. Renewed Nov. 12, 1901. Serial No. 52,044. (No model.)

Claim.—1. A tilting, tubular, water-containing grate provided with hallow transverse members formed with a water-passage through them, in combination with hallow bearings for said transverse members and communicating with said water-passages and with inlet and outlet pipes at the opposite ends of said grate, terminating in said bearings, and arranged at right angles to the axis of the grate, so as to yield laterally, to provide for expansion and contraction of the grate, and connected to a water-supply under pressure, whereby a water-current through the grate is maintained, substantially as set forth.

2. A tilting, tubular, water-containing grate consisting of a hallow grate-body provided at its ends with central, projecting, tapering transverse members having a lateral water-passage through their tapering walls, in combination with pressure inlet and outlet pipes at the opposite ends of said grate, at right angles to its axis, to provide for expansion and contraction of the grate, and with hallow bearings mounted on said pipes, formed with tapering apertures to receive and fit upon said transverse members and inlets and outlet water-passages, and with a nut on each transverse member adjacent to its bearing and adapted to tighten the joint, substantially as set forth.

701,947. MEANS FOR TRANSMITTING SYNCHRONOUS MOTION TO DISTANT POINTS. LOUIS SARKIS, New York, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Oct. 12, 1891. Serial No. 79,146. (No model.)

Claim.—1. In a system for transmitting synchronous motion, the combination with a motor, having two relatively rotatable members, one provided with a given number of permanent poles and the other with twice as many pole-pieces, of means located at a distance from the motor and under the control of the operator, whereby said pole-pieces can be energized alternately and with alternate polarity.

2. In a system for transmitting synchronous motion, the combination with a motor having two relatively rotatable members, one provided with a given number of permanent poles and the other with twice as many pole-pieces and coils, of two separate circuits each including every alternate coil, and means located at a distance and under the control of the operator whereby each circuit can be supplied with current alternately, and in alternate direction.

3. In a system for transmitting synchronous motion, the combination with a motor having two relatively rotatable members, one provided

with a given number of permanent poles and the other with twice as many pole-pieces and coils, of two separate circuits each including every alternate coil, and a master-controller connected with said circuits whereby an operator can energize a different circuit at each movement of the controller.

4. In a system for transmitting synchronous motion, the combination with a motor having two relatively rotatable members, one provided with a given number of permanent poles, and the other with twice as many pole-pieces and coils, of two separate circuits each including every alternate coil, and a master-controller provided with segments arranged to connect said circuits alternately with a source of power and to reverse the direction of the current in each circuit each time it is cut in.

5. In a system of train control, the combination with one or more master-arms, of a main controller for the car-motors, a motor for actuating the controller having two relatively rotatable members, one provided with a given number of permanent poles and the other with twice as many pole-pieces and coils, and a master-controller connected with the motor whereby one member will be kept permanently polarized when the current is turned on, and the coils on the other member will receive current alternately and in alternate directions, as the master-controller is rotated.

6. In a system of train control, the combination with a train of two or more motor-cars, of a main controller on each car for controlling the car-motors, an actuating-motor for each main controller, having two separate sets of coils in one of its members, one of these main-controllers on each car, and circuit connections whereby the coils in one member of said motor are connected in series with each other and with one or the other of said sets of coils in the other member, and whereby current can be sent through said sets of coils alternately and in alternate directions as the master-controller is rotated.

7. In a system of train control, the combination with the main controller, of an actuating device therefor comprising a multipolar direct-current motor having a permanently-polarized armature and a field-magnet containing twice as many poles as the armature, and a master-controller for alternately energizing alternate poles in order to produce a step-by-step movement of the armature, in synchronism with the motion of the master-controller.

701,948. APPARATUS FOR EXTRACTING SCREW-BOLTS. ALFRED L. SAMP, Vincennes, Ind., assignor to Draper Company, Indianapolis, Ind., a Corporation of Indiana. Filed Apr. 9, 1898. Serial No. 102,008. (No model.)

Claim.—1. In a device of the class described, a frame, an adjustable nut-holder mounted thereon, a rotatable extruder in axial alignment with the nut-holder and having a threaded shank of the pitch of the screw to

be withdrawn, and a threaded bearing on the frame for the shank, the object containing the screw to be withdrawn being inserted between said nut-holder and extruder and the former set up to press firmly on the nut while the latter is in engagement with the screw-head, rotation of the extruder as it moves longitudinally in its bearing turning out the screw therewith, the pressure of the nut-holder on the nut being maintained by or through the like pitch of the screw-thread and the thread on the extruder.

2. In a device of the class described, a frame having opposite rigid upturned ears, a threaded bearing in each, in axial alignment, a threaded, longitudinally-adjustable nut-holder mounted in one bearing and having a capped end, to engage the outer face of the nut, and an extruder constructed at its inner end to engage the screw-head and having its shank threaded to correspond with the pitch of the screw to be removed, said extruder being mounted in the opposite threaded bearing of the frame, rotation of the extruder withdrawing the screw while the pressure of the nut-holder is maintained upon the nut to prevent rotation of the same.

3. In a device of the class described, a frame comprising a base and opposite, upturned ears having threaded bearings in axial alignment with each other, the ears being adapted to receive between them the end of a beam-elastic containing the screw to be removed, a nut-holder having a threaded shank, rotatably mounted in one bearing and having its inner end capped to bear against the nut of the screw in the elastic and to clear the adjacent end of the screw, and a rotatable extruder having a threaded shank of a pitch corresponding to that of the screw to be removed and rotatably mounted in the other bearing, the inner end of the extruder being adapted to enter the slot of the screw-head, the nut-holder being adjusted to tightly press upon and hold the nut from rotation when the extruder is in engagement with the screw-head, subsequent rotation of the extruder acting to unscrew the screw from the nut, the like pitch of the screw-thread and thread of the shank of the extruder maintaining the pressure of the nut-holder upon the nut to prevent its from turning with the screw.

701,949. ELECTRIC-INCANDESCENT-LAMP HOLDER. BENJAMIN G. SHERMAN, London, England, assignor of one-half to Horner Electric Light, Limited, London, England. Filed Dec. 11, 1899. Serial No. 59,628. (No model.)

Claim.—1. In an electric-incandescent-lamp holder the combination with two separable members of two hook-and-eye electric contacts coupling the members together and limiting the distance which they can move apart, and concentrically arranged between them, a spring-pressed electric contact forcing the said members apart substantially as set forth.

2. In an electric-incandescent-lamp holder the combination with two separable members of a hook-and-eye electric contact coupling the members together and limiting the distance which they can move apart, of a spring-pressed contact-plunger on one member, a contact on the other member and a contact for the plunger within the contact substantially as set forth.

3. In an electric-incandescent-lamp holder, two separable members, a set of three contacts on each member one of the contacts in each set being axially arranged and spring-pressed, and the remaining two contacts on one member slanted at unequal distances from the axial contact and consisting of double latches, for engagement with eye-contacts similarly slanted on the other member, substantially as set forth.

701,950. CULTIVATOR. HARRY SHAW, Cambridge City, Ind. Filed Sept. 12, 1891. Serial No. 75,182. (No model.)

Claim.—1. In a cultivator, the combination with the frame thereof, supporting-wheels carried thereby, and a pair of gang-plows arranged beneath said frame, of means pivotally connected to said frame to which said plows are connected, and through the medium of which said plows may be swung toward or away from each other and maintained parallel to the line of draft, a draft-bar slidably mounted upon the tongue of the machine and extending longitudinally thereof, and a balancing-lever pivotally connected to said draft-bar and extending transversely thereof, said lever being adjustably connected to the radius-bar, whereby the draft of the team is transmitted to the plows through the draft-bar and equally distributed to said plows.

2. In a cultivator, the combination with the frame thereof, supporting-wheels carried thereby, and a pair of gang-plows arranged beneath said frame, of a pair of radius-bars for each of said plows, said radius-bars being pivotally connected to the frame and to which bars the plows are connected, whereby the plows may be swung toward or away from each other and maintained parallel to the line of draft, a draft-bar slidably mounted upon the tongue of the machine and extending longitudinally thereof, and a balancing-lever pivotally connected to said draft-bar and extending transversely thereof, said lever being adjustably connected to the radius-bar, whereby the draft of the team is transmitted to the plows through the draft-bar and equally distributed to said plows.

3. In a cultivator, the combination with the frame thereof, supporting-wheels carried thereby, and a pair of gang-plows arranged beneath said frame, of a pair of radius-bars for each of said plows, said radius-bars being pivotally connected to the frame and to which bars the plows are adjustably connected, whereby the plows may be adjusted in a vertical plane and swung in a horizontal plane and maintained parallel to the line of draft, a draft-bar slidably mounted upon the tongue of the machine and extending longitudinally thereof, and a balancing-lever pivotally connected to said draft-bar and extending transversely thereof, said lever being adjustably connected to the radius-bar, whereby the draft of the team is transmitted to the plows through the draft-bar and equally distributed to said plows.

4. In a cultivator, the combination with the frame thereof, supporting-wheels carried thereby, and a pair of gang-plows arranged beneath said frame, of a pair of radius-bars for each of said plows, said bars being pivotally connected to the frame, a swivel-bar carried by each pair of said radius-bars and to which the respective gang-plows are adjustably connected, an arm carried by each of said swivel-bars, a link connected to each of said arms and also connected to the cultivator-frame, whereby the plows may be swung toward or away from each other and maintained parallel to the line of draft, a draft-bar slidably mounted upon the tongue of the machine and extending longitudinally thereof, and a balancing-lever pivotally connected to said draft-bar and extending transversely thereof, said lever being adjustably connected to the radius-bar, whereby the draft of the team is transmitted to the plows through the draft-bar and equally distributed to said plows.

5. In a cultivator, the combination with the frame thereof, supporting-wheels carried thereby, and a pair of gang-plows arranged beneath said frame, of means pivotally connected to said frame to which said plows are connected, and through the medium of which said plows may be swung toward or away from each other and maintained parallel to the line of draft, a draft-bar slidably mounted upon the tongue of the machine and extending longitudinally thereof, and a balancing-lever pivotally connected to said draft-bar and extending transversely thereof, said lever being adjustably connected to the radius-bar, whereby the draft of the team is transmitted to the plows through the draft-bar and equally distributed to said plows.

6. In a cultivator, the combination with the frame thereof, supporting-wheels carried thereby, and a pair of gang-plows arranged beneath said frame, of a pair of radius-bars for each of said plows, said bars being pivotally connected to the frame, a swivel-bar carried by each pair of said radius-bars and to which the respective gang-plows are adjustably connected, an arm carried by each of said swivel-bars, a link connected to each of said arms and also connected to the cultivator-frame, whereby the plows may be swung toward or away from each other and maintained parallel to the line of draft, a draft-bar slidably mounted upon the tongue

of the machine and extending longitudinally thereof, a balancing-arm pivotedly connected to said draft-bar and extending transversely thereof, and links extending from the draft-bar to the radius-bar, whereby the draft of the team is transmitted to the plows through the draft-bar and equally distributed to said plows.

701,951. WRENCH. WILLIAM SHINE, Panama, Iowa. Filed June 10, 1901. Serial No. 64,912. (No model.)

Claim.—The herein-described wrench comprising a stock or frame of uniform thickness throughout its length and breadth having one end contracted and constituting a handle and having its opposite end widened and provided with a slot extending laterally and opening through opposite sides of the stock, said slot being flared at its outer end, contracted at its inner end and widened at a point intermediate the ends of the contracted part, plates secured to opposite sides of the stock and closing the sides of the slot thereof and having longitudinal slots and openings in coexistent relation, jaws pivoted between the plates, springs secured to the stock and exerting an inward pressure upon the inner end of the jaws, a threaded stem located in the inner contracted end of the slot formed in the stock and having a nut or wedge to enter between the inner ends of the jaws and having extensions to operate in the longitudinal slots of the aforementioned plates, and a nut mounted upon the threaded stem and arranged to operate in the widened portion of the slot of the stock and having opposite portions projecting through the openings in the side plates, substantially as set forth.

701,952. NUT-WRENCH. CHARLES C. SMITH, Bellevue, Idaho. Filed Mar. 13, 1902. Serial No. 36,034. (No model.)

Claim.—In a nut-wrench of the character described, the combination with pivoted handles formed with jaws at their outer ends dovetail in cross-section, of removable chews having dovetail grooves to receive the dovetail jaws and provided with serrated gripping-edges and formed with slots in their rear ends, substantially as set forth.

701,953. FRICTION-CLUTCH. HERBERT SMITH, Springfield, Mass. Filed Aug. 21, 1901. Serial No. 72,967. (No model.)

Claim.—1. In a clutch of the character described, the combination with the power-shaft, of the disk free relatively thereto, having the annular flange, the support carried by the shaft, the detachable friction-chose located within the disk-flange and connected to the support for movement in unison therewith, the spindles having rocking motions on the support and provided with the cone operating on the friction-chose, and the centrifugal weight-arms affixed to the spindles.

2. In a clutch of the character described, the combination with the power-shaft, of the disk free relatively thereto, having the annular flange, the support carried by the shaft, the detachable friction-chose located within the disk-flange and connected to the support for movement in unison therewith, the spindles having rocking motions on the support and provided with the cone operating on the friction-chose, and the centrifugal weight-arms affixed to the spindles.

vided with the cone operating on the friction-chose, the double arms fixed to each spindle, one being a centrifugally-acting member, and the other a member to restrain such action, and a device movable into and from engagements with the restraining-arms, for the purpose set forth.

3. In a clutch, the combination with the power-shaft, having the carrier or support D affixed thereon, and which is provided with the journal-hubs *g g* of the disk to be driven mounted loosely relatively to the shaft and having the edge flange, the friction-chose *U U*, comprised of flexible arc-shaped members *u*, and integral with, cutting members *u'* and a central ring *h* located within the flange-disk, the ends of each chose being located adjacent, but separated from, the cutting member *u'*, the spindles *k* passed through the journal-hubs of the support, and each provided with the cone *j* at one end, and at the other with a centrifugal arm, substantially as described.

4. In a clutch, the combination with the power-shaft, having the carrier or support D affixed thereon, and which is provided with the journal-hubs *g g* of the disk to be driven mounted loosely relatively to the shaft and having the edge flange, the friction-chose *U U*, comprised of flexible arc-shaped members *u*, and integral with, cutting members *u'* and the central ring *h* located within the flange-disk, the ends of each chose being located adjacent, but separated from, the cutting member *u'*, and the cutting members having the partially-cylindrical cone-ends *u*, the spindles *k* passed through the journal-hubs of the support, and each provided with the cone *j* resting in said cone, at one end, and at the other end provided with a centrifugal arm, substantially as described.

5. In a clutch, the combination with the power-shaft, of the disk free relatively thereto, having the annular flange, the support carried by the shaft, the detachable friction-chose located within the disk-flange, the spindles having rocking motions on the support and provided with the cone operating on the friction-chose, the double arms fixed to each spindle, one being a centrifugally-acting member, and the other a member to restrain such action, provided with an adjustable contact-arm *a*, and a device movable into, and from, engagements with the said contact-arms, for the purpose set forth.

6. In a clutch of the character described, the combination with the power-shaft, of the disk free relatively thereto, having the annular flange, the support carried by the shaft, having the hub thereof provided with the opposite projections *e e*, the detachable friction-chose located within the disk-flange, the spindles having rocking motions on the support and provided with the cone operating on the friction-chose, and also with the centrifugal weight-arms affixed to the spindles, and the spring interposed between the said arms and said projections *e*.

7. In a clutch, the combination with the power-shaft, carrying the support D, of the disk to be driven loosely mounted on the shaft provided with the concentric hub *D* and the rim-flange *e*, the cone appliances consisting of the concentric ring *h*, the radial *u* members *u' u'*, and the arc-shaped chose members *U U* integral with the *u* members, and extending from their connections with the one into proximity to the other, as shown, the one side of each *u* member having a partial cylindrical cone-ends, the spindles having rocking motions on the support, and provided each at one end with the cone having its partially-cylindrical portion fitted in said cone-ends, and having the cone-circular portion thereof in engagement with the free end of the friction-chose, and each spindle having at its other end the centrifugal arm *a* and the oppositely-extended arm *g*, and the sliding cone-shoe arranged to engage and disengage the arm *g*, for the purpose set forth.

8. In a clutch, the combination with the driving-shaft, and a part free therefrom to be driven thereby, of a support mounted on the driving part provided with centrifugal members, friction-chose, consisting with the parts to be driven, arranged to be operated on by said centrifugal

members, and said centrifugal members having restraining-arms, extended into approach relation to the driving-shaft and the cone-shoe arranged to slide on the shaft to disengage, and to engage, said restraining-arms, for the purpose set forth.

9. In a clutch, the combination with the power-shaft, of the disk free relatively thereto, having the annular flange, the support carried by the shaft, the detachable friction-chose located within the disk-flange, the spindles having rocking motions on the support and provided with the cone operating on the friction-chose, the double arms fixed to each spindle, one being a centrifugally-acting member, and the other a member to restrain such action, and a device movable into, and from, engagements with the said restraining-arms, for the purpose set forth.

701,954. KERNAL TRUSS. NELSON B. SMITH, Kewanee, Ill. Filed Mar. 22, 1901. Serial No. 62,941. (No model.)

Claim.—1. A truss-brace comprising a spring member adapted to partly encircle the body and to carry at the front an adjustable pad, said spring member having at the front end an upwardly-extending bolt-engaging loop, and at the rear end a downwardly-extending portion for engagement with the rear of the body, and a bolt adapted to encircle the body and connected with the downwardly-extending portion and also engaging the said front loop at a point above the pad.

2. In a truss, a spring-brace adapted to partially encircle the body, said brace having an upwardly-bent side portion to avoid injurious pressure on the sides of the body, a downwardly-extending portion arranged at the rear end of the brace for engagement with the body, a pad secured to the forward end of said brace, and an auxiliary bolt extending around the body and engaging the front and rear ends of said brace.

3. In a truss, a spring member adapted to partly encircle the body and having at the front end an upwardly-bent bolt-engaging loop, a pad adjustably carried by the forward end of the spring member, the rear end of said spring member being downwardly and forwardly bent to form a loop, the lower end of which is in approximately the horizontal plane of the pad, and an auxiliary bolt extending around the body and engaging the front and rear ends of said spring member.

4. In a truss, a spring member adapted to partially encircle the body and having at the forward end a vertically-disposed bolt-engaging loop and at the rear end a downwardly and forwardly extending integral loop, a wire gauge or netting carried by the rear loop for engagement with the body, said integral loops forming the framework and support of the gauge, and a bolt adapted to encircle the body and to engage with both of said loops.

701,955. AUTOMATIC REGISTERING DEVICE. RALPH R. SPEARS, Wheeling, W. Va. Filed June 25, 1901. Serial No. 65,095. (No model.)

Claim.—1. In a device of the character described, the combination with a platform and registering mechanism, of a reciprocating actuator extended through the platform and having a bearing therein, a lever supported by the platform below the same and constituting a support for the actuator, an adjustable resistance device opposing the depression of the lever, and means operatively connecting the lever with the registering mechanism.

2. In a device of the character described, the combination with a platform and registering mechanism, of a lever located below the platform and fulcrumed at one end, means connecting the free end of the lever with the registering mechanism, a resistance device suspended from the platform and resisting the depression of the lever, and a reciprocating actuator passed through the platform and having a bearing therein, said actuator being supported upon the upper edge of the lever at a point between the resistance device and the fulcrum.

3. In a device of the character described, the combination with a platform and registering mechanism, of an actuator extended through the platform, a lever located below the platform and operatively related to the actuator and registering mechanism respectively, an adjustable resistance device opposing the movement of the lever, and an adjustable stop for limiting the movement of said lever.

4. In a device of the character described, the combination with a platform, registering mechanism and an actuator extended through the platform, of an operating-lever disposed below the platform and having operative connection with the actuator and registering mechanism respectively, a supporting-plate for said lever, a spring sustaining the plate, and means for regulating the tension of the spring.

5. In a device of the character described, the combination with a platform, registering mechanism and an actuator extended through the platform, of an operating-lever located below the platform and operatively related to the actuator and registering mechanism respectively, supporting-rods depending from the platform at opposite sides of the lever, a supporting-plate slidably mounted upon said rods, springs encircling the pendant rods and sustaining the supporting-plate, and means for regulating the tension of said springs.

6. In a device of the character described, the combination with a platform, a registering mechanism, and an actuator extended through the platform, of an operating-lever located below the platform and operatively related to the actuator and registering mechanism respectively, a guiding-bracket for said lever, an adjustable stop-rod carried by said bracket and disposed to limit the movement of the lever in one direction, pendant rods located at opposite sides of the lever, a supporting-plate slidably mounted on said rods, springs encircling the rods and sustaining the supporting-plate, a second plate carried by the rods and opposed to the lower ends of the springs, and said second plate upon the lower ends of the rods and designed to be adjusted thereon to regulate the tension of the springs.

7. In a device of the character described, the combination with a platform and registering mechanism, of an actuator extended through the platform and operatively related to the registering mechanism, and approach-guides disposed above the platform and defining an approach converging toward the actuator.

8. In a device of the character described, the combination with a platform, registering mechanism, and an actuator extended through the platform, of approach-guides located at opposite sides of the actuator and defining an approach converging toward the actuator from opposite directions.

9. In a device of the character described, the combination with a platform, registering mechanism, and an actuator extended through the platform, of approach-guides located at opposite sides of the actuator and defining an approach converging toward the actuator from opposite directions.

701,956. BOTTLE-WARNING MACHINE. FRANK I. SPRINGER, Buffalo, N. Y. Filed May 26, 1901. Serial No. 61,000. (No model.)

Claim.—1. In a device of the character described, the combination with a main-receptacle, of a water-pipe joined to said receptacle, a two-way valve connected in said water-pipe, a spray-pipe, a two-way valve connected to said spray-pipe, and to said receptacle, a rising-pipe connected to said valve, and means for operating said valve in unison to admit water in turn into said receptacle or into said rising-pipe, substantially as described.

2. In a device of the character described, the combination with a main-receptacle, a pipe joined to said receptacle and fitted with a two-way valve, a pipe open at the bottom, mounted in said receptacle and provided with a two-way valve, a pipe connecting said two-way valve, and a connecting-rod connecting said valves in unison to operate them in unison, substantially as described.

3. In a device of the class described, the combination with a sand-receptacle provided with a water-supply pipe and passages communicating therewith, of a central cup provided with legs and inverted over said water connection, said passages being constructed to direct the water to force sand under said cup, and a spray-pipe connected to said central cup, substantially as described.

701,957. METHOD OF WORKING CLAY. RALPH H. STALEY, Springfield, Ill. Filed Aug. 1, 1901. Serial No. 70,540. (No specimens)

Claim.—1. The method of working clay, consisting in providing tempered clay, disintegrating said clay in vacuum, exhausting the air from said disintegrated clay and compressing said clay in vacuum, substantially as set forth.

2. The method of working clay, consisting in providing tempered clay, introducing said clay under pressure into a vacuum-chamber, disintegrating said clay in vacuum, exhausting the air from said disintegrated clay, compressing said clay in vacuum, and expelling said compressed clay from said vacuum-chamber, substantially as set forth.

3. The method for the continuous working of clay, consisting in providing tempered clay, introducing said clay continuously under pressure into a vacuum-chamber, utilizing said incoming clay as a seal against admission of air to the vacuum-chamber, disintegrating said clay in vacuum, exhausting the air from said disintegrated clay, compressing said clay in vacuum, expelling said compressed clay from said vacuum-chamber and utilizing said compressed clay as a seal against the admission of air into the vacuum-chamber, substantially as set forth.

701,958. AUTOMATIC CUT-OUT. CHARLES P. SCHENCK, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Mar. 4, 1902. Serial No. 707,500. (No model.)

Claim.—1. The combination of alternating-current and direct-current mains, a dynamo-electric machine connected to both sets of mains and driven by energy transmitted over one of said sets of mains, a circuit supplied with current from said alternating-current mains, means for causing the current in said circuit to increase with increase of frequency of current in said alternating-current mains, and means controlled by current in said circuit for interrupting the supply of energy to said dynamo-electric machine.

2. The combination of a dynamo-electric machine, alternating-current and direct-current mains extending therefrom, a circuit-interrupting device for one of said sets of mains, a circuit connected across the alternating-current mains, means for causing current in said circuit to increase with increase of frequency of the alternating electromotive forces impressed upon said alternating-current mains, and means actuated by current in said circuit for operating said circuit-interrupting device.

3. The combination of alternating-current mains, means for impressing thereon alternating electromotive forces of normal frequency, a circuit connected to said mains, means for causing the current in said circuit to increase with increase of frequency of current in said mains above the normal, and means operative upon increase of current in said circuit for interrupting the flow of current in said mains.

4. The combination of a dynamo-electric machine, conductors in connection therewith on which alternating electromotive forces are impressed of a frequency corresponding to the speed of the machine, a tuned circuit in connection with said conductors, a local circuit controlled by current in the tuned circuit, and means controlled by said local circuit for interrupting the driving power of said machine.

5. The combination of a rotary converter of variable speed, alternating-current and direct-current mains, circuit-interrupting devices for said mains, a tuned circuit connected across two of the alternating mains, and means operated by current in said circuit for controlling the circuit-interrupting devices.

6. The combination of a rotary converter alternating-current and direct-current mains, a tuned circuit supplied with energy from the alternating mains, and means responsive to current in said tuned circuit for interrupting both the alternating-current and the direct-current mains.

701,959. SLOWER FOR PYROELECTRIC LAMPS AND PROCESS OF MAKING SAME. CHARLES P. SCHENCK, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Nov. 6, 1901. Serial No. 61,304. (No model.)

Claim.—1. A slower for a pyroelectric lamp, consisting of a body of magnetism or the like, having leading-in wires, and magnets or the like including the joints between said wires and the body.

2. A slower for a pyroelectric lamp, consisting of a body of magnetism or the like provided at each end with a leading-in wire, and a mass of fused magnets including the joints between each wire and the body.

3. A slower for a pyroelectric lamp consisting of a body of magnetism or the like, leading-in wires wound on the ends of said body, and a mass of fused magnets surrounding each of said wire-wound ends.

4. The process of making a pyroelectric slower, which consists in providing a body of suitable material with leading-in wires, and then including the joints between said wires and body in magnets or the like.

5. The process of making a pyroelectric slower, which consists in providing a body of suitable material with leading-in wires, including the

joints between said wires and body in magnets, and then fusing the magnets.

6. The process of making a pyroelectric slower, which consists in providing a body of suitable material with leading-in wires, placing powdered magnets on the joints between said wires and body, and then fusing said magnets.

701,960. SUPPORT FOR BRICK ARCHES. HERMAN A. STRATZ, Grand Rapids, Mich. Filed Aug. 20, 1901. Serial No. 71,402. (No model.)

Claim.—1. The combination of curved plates arranged in parallel vertical planes, a series of detachable bars and bolts for connecting the plates, grippers pivoted to the plates, bolts connected to the base of one end and passing through the grippers, and nuts on the bolts to adjust the grippers, substantially as described.

2. The combination of curved plates arranged in parallel planes, a bar connecting the middle of the plates and having perforated legs at each side, bolts passing through the plates and legs, bars connecting the plates near the ends thereof, bolts connecting the ends of the plates, grippers pivoted to said bolts, bolts passing through the end bars and grippers, and nuts on the bolts to adjust the grippers, substantially as described.

3. In combination with a brick arch, laterally-curved plates arranged in parallel planes, and having their concave edges engaging the convex top of the arch, grooves in the adjacent sides of the plates and near the ends thereof, detachable transverse bars inserted in the grooves, grippers pivoted to the plates and engaging the opposite ends of the arch, bolts connecting the bars and grippers, and nuts on the bolts to adjust the grippers, substantially as described.

4. In combination with a brick arch, laterally-curved plates arranged in parallel planes, and having grooves in their adjacent sides, said grooves being located at the ends and center of said curved plates, a transverse bar near the middle of the plates and having its ends in the opposing grooves, legs on the bar, bolts extending through the plates and legs, transverse bars near the ends of the plates, and having their ends in opposing grooves, transverse bolts connecting the ends of the plates, grippers pivoted on said bolts, and bolts connecting the grippers to the adjacent transverse bars, substantially as described.

701,961. MERCHANDISE-TRANSFER APPARATUS. ALEXANDER W. SWANICK, Chicago, Ill., assignor to Swannick Company, Chicago, Ill., a Corporation of Delaware. Filed Feb. 22, 1901. Serial No. 62,172. (No model.)

Claim.—1. A merchandise-transfer apparatus comprising a traction-floor, a truck for carrying merchandise thereon, a fluid-pressure motor for moving said truck, steering mechanism for guiding said truck on said floor, a storage-reservoir upon said truck for supplying said motor with pressure, a storage-reservoir intake upon said truck, a fluid-pressure-supply main supported adjacent to said traction-floor, a valve-controlled outlet from said main, and means for connecting said outlet with said intake, substantially as described.

2. A merchandise-transfer apparatus comprising a traction-floor, a truck for carrying merchandise thereon, a fluid-pressure motor for moving said truck, steering mechanism for guiding said truck on said floor, a storage-reservoir upon said truck for supplying said motor with pressure, a storage-reservoir intake upon said truck, a fluid-pressure-supply main supported adjacent to said traction-floor, a plurality of valve-controlled outlets from said main arranged at intervals thereon, and means for connecting said outlets with said intake, substantially as described.

3. A merchandise-transfer apparatus comprising a traction-floor, a truck for carrying merchandise thereon, a fluid-pressure motor for moving said truck, steering mechanism for guiding said truck on said floor, a storage-reservoir upon said truck for supplying said motor with pressure, a storage-reservoir intake upon said truck, a fluid-pressure-supply main at each side of said traction-floor supported adjacent to said traction-floor, valve-controlled outlets from said mains, and means for connecting said outlets with said intake, substantially as described.

4. A merchandise-transfer apparatus comprising a traction-floor, a truck for carrying merchandise thereon, a fluid-pressure motor for moving said truck, steering mechanism for guiding said truck on said floor, a storage-reservoir upon said truck for supplying said motor with pressure, a storage-reservoir intake upon said truck, a fluid-pressure-supply main at

each side of said traction-floor, and under said platform, supported adjacent to said traction-floor, a valve-controlled outlet from said main, and means for connecting said outlet with said intake, substantially as described.

5. A merchandise-transfer apparatus comprising two parallel tracks, two platforms arranged within said tracks and adjacent thereto, a traction-floor between said platforms, a merchandise-carrying truck upon said floor, a fluid-pressure motor upon said truck provided with a storage-reservoir and a valve-controlled intake for said reservoir, a fluid-pressure-supply main supported adjacent to said traction-floor, a plurality of valve-controlled outlets from said main arranged at intervals thereon, and means for connecting said intake with the outlet on said main whereby the storage-truck can be charged while the same is being loaded adjacent to said platform, substantially as described.

701,962. RAILWAY CLEARING-HOUSE. ALEXANDER W. SWANICK, Chicago, Ill., assignor to Swannick Company, Chicago, Ill., a Corporation of Delaware. Filed Feb. 17, 1902. Serial No. 64,597. (No model.)

Claim.—1. A railway clearing-house comprising a gravity-mound, a distributing incline at each end of said gravity-mound, and a distributing-yard for each of said inclines, substantially as described.

2. A railway clearing-house comprising a gravity-mound, an incline at each end of said gravity-mound, a distributing-yard connected with each of said inclines, and crossovers-tracks, and switches so disposed as to permit simultaneous operation of trains coming from opposite directions, upon said gravity-mound, substantially as described.

3. A railway clearing-house comprising a gravity-mound, an incline at each end of said gravity-mound, a distributing-yard connected with each of said inclines, and diagonal tracks, adjacent to each of said distributing-yards, and arranged to permit trains requiring to be cleared to be switched onto said gravity-mound, from either end, and distributed at the other, substantially as described.

701,968. MACHINE FOR MITERING AND CORNERING BOX-BLANKS. ROBERT E. TAYLOR, LYNN, MASS. Filed Jan. 10, 1900. Serial No. 987. (No model.)

Claim.—1. In a box mitering and cornering machine, in combination, a work-support, an angular cutter transversely adjustable about a center located eccentrically and exteriorly with relation to the vertex of the angle of the cutter, and means to support and actuate the said cutter, substantially as described.

2. In a box mitering and cornering machine, in combination, a work-support, a pair of coacting angular cutters transversely adjustable about a center located eccentrically and exteriorly with relation to the vertex of the angle of the cutter, and means to support and actuate the said cutters, substantially as described.

3. In a box mitering and cornering machine, in combination, a work-support, an angular cutter, and means to adjust the same from its mitering position to its cornering position, and vice versa, and simultaneously therewith shift transversely the vertex of the said cutter to correspond with the required difference in the positions of the respective cuts, substantially as described.

4. In a box mitering and cornering machine, in combination oppositely-disposed angular cutters, each transversely adjustable about a center located eccentrically and exteriorly with relation to the vertex of the angle of each cutter, means to support and actuate the respective cutters, movable projecting handles by which to swing the cutters about their centers of adjustment, and locking devices controlled by the said handles and serving to retain the cutters in the opposite positions of adjustment, substantially as described.

5. In a box mitering and cornering machine, in combination, oppositely-located cutting devices, a support on which the said cutting devices are mounted with capacity for movement toward and from each other, means to actuate the movable cutters, means to effect simultaneous adjustment of the respective cutting devices in opposite directions, and devices whereby the respective cutting devices may be placed at will in

and out of operative connection with the said adjusting means, substantially as described.

6. In a box mitering and cornering machine, in combination, oppositely-located cutting devices, a support on which the said cutting devices are mounted with capacity for movement toward and from each other, means to actuate the movable cutters, a right and left screw and means to rotate the same when desired, half-cuts to engage with the respective threads of the said screw, and devices whereby the respective half-cuts may be placed at will in and out of engagement with the corresponding threads of the said screw, substantially as described.

7. In a box mitering and cornering machine, in combination, a work-support, an angular cutter comprising a stationary and a movable member, supporting means for the latter, comprising a cutter-block to which the blades of the cutter are secured, a cutter-bar, a securing-bolt passing through a slot in said cutter-block, and adjusting-screws engaging the rear face of the said cutter-block to adjust the said block laterally, substantially as described.

8. In a box mitering and cornering machine, in combination, a work-support, an angular cutter comprising a stationary and a movable member, a cutter-bar carrying the movable member, a reciprocating cross-head above the bar, a spring for holding the bar in contact with the cross-head, and an adjustable yoke intermediate the bar and the cross-head.

9. In a box mitering and cornering machine, in combination a work-support, a pair of coacting angular cutters, a carriage for each of said cutters, a right and left hand screw for adjusting said cutters laterally toward and from each other, a shaft at right angles to said screw and connected therewith by beveled gears and means to rotate said shaft to adjust the said carriage, substantially as described.

10. In a box mitering and cornering machine, in combination a work-support, an angular cutter, supporting means for said cutter comprising a sliding carriage and actuating means therefor, a table pivoted on said carriage, the pivot of the table being located eccentrically and exteriorly with relation to the vertex of the angle of the cutter, substantially as described.

11. In a box mitering and cornering machine, in combination a work-support, an angular cutter, supporting means therefor, comprising a carriage adjustable relatively to said work-support, a table pivoted on said carriage, a locking-pin on said table, a spring-actuated dog controlling said pin, said dog being provided with a handle whereby to release the locking-pin and move the table, substantially as described.

12. In a box mitering and cornering machine, in combination, a work-support, an angular cutter, means for supporting and actuating the cutter comprising a sliding carriage, an actuating-screw therefor, a sliding half-cut 71 to engage the screw, a pin 77, and cam-lever 73 for throwing the half-cut 71 into or out of engagement with the said actuating-screw, substantially as described.

701,964. MITERING-POST. JAMES A. TAYLOR, DUNSMO, N.H. Filed Nov. 12, 1891. Serial No. 98,093. (No model.)

Claim.—1. A hitching-post having its upper end bifurcated to form laterally-spaced members, a latch pivotedly mounted for movement of its end between the members, means for holding the latch yieldably in position with its end between the members, and a keeper connecting the spaced members at the opposite side of the post from the latch and below the upper end of the latch.

2. A hitching-post having its upper end bifurcated to form laterally-spaced members, a latch having an ear pivotedly mounted between the members at the lower ends thereof, said latch being adapted for movement with its upper end between the members, means for holding the latch yieldably with its upper end between the spaced members, and a keeper connecting the spaced members at the opposite sides thereof from the latch and below the upper end of the latch, the spaced members of the post being in the form of loops, as and for the purpose set forth.

701,965. ELECTRIC MOTOR. RAY TOWNSEND, DUNSMO, N.H. Filed Oct. 22, 1899. Serial No. 94,057. (No model.)

Claim.—1. In combination, a connection-board provided with fixed terminals, and an electric motor having its extending-windings provided with corresponding terminals constructed and arranged to engage therewith.

2. A connection-board for electric motor, comprising a base and a set of terminals mounted thereon constructed and arranged to engage corresponding terminals connected to the motor-windings when the motor is placed in position.

3. A connection-board for electric motor, comprising a base, a set of terminals mounted thereon constructed and arranged to engage corresponding terminals connected to the motor-windings when the motor is placed in position, and means for fastening the motor to said base.

4. A connection-board for electric motor, comprising a base, a set of terminals mounted thereon constructed and arranged to engage corresponding terminals connected to the motor-windings when the motor is placed in position, and fastening devices for the motor also mounted on said base.

5. In an electric motor, a set of terminals supported from the motor-frame and connected to the motor-windings, said terminals being constructed and arranged to engage a corresponding set of terminals, connected to line, when the motor is placed in position.

6. In combination in an electric motor, a separate compartment, and a set of terminals to which the motor-windings are connected mounted therein, said terminals being constructed and arranged to engage a corresponding set of terminals connected to line.

7. In combination, in an electric motor, a compartment containing the actuating mechanism of said motor and a separate compartment containing a set of terminals to which the motor-windings are connected, said terminals being constructed and arranged to engage corresponding terminals connected to line.

8. An electric motor provided with terminals to which the motor-windings are connected, said terminals being constructed and arranged to engage corresponding terminals on the motor-support when the motor is placed in position.

9. An electric motor provided with terminals to which the motor-windings are connected, said terminals being constructed and arranged to engage corresponding terminals on the motor-support when the motor is placed in position, and means for fastening said motor in position on said support.

10. In an electric motor, a magnetized motor-shaft and a magnetized disk in rolling engagement therewith.

11. In an electric motor, a magnetized motor-shaft, a magnetized disk in rolling engagement therewith, an air-layer of non-magnetic material interposed between said shaft and said disk.

12. In an electric motor, a shaft of magnetic material, a disk of magnetic material in rolling engagement therewith, and means for magnetizing said disk and shaft.

13. In an electric motor, a shaft of magnetic material, a disk of magnetic material in rolling engagement therewith, and operatively connected to the recording mechanism, and means for magnetizing said shaft and disk.

14. In combination in an electric motor, a magnetized motor-shaft, a magnetized disk in rolling engagement therewith, and means for transmitting the motion of said disk to the recording mechanism.

15. In combination in an electric motor, a permanent magnet, a shaft of magnetic material adjacent to one of the poles of said magnet, and a

disk of magnetic material mounted on said shaft and arranged to have a rolling engagement with the said driving-shaft of the motor.

16. In combination in an electric motor, a retarding-magnet, and a magnetic gearing between the driving-shaft and the recording mechanism, arranged to be magnetized by said magnet.

17. In combination in an electric motor, a main driving-shaft of magnetic material, an armature of conducting material mounted thereon, a retarding-magnet having its poles extended to include a portion of said armature, a second shaft operatively connected to the motor recording mechanism, and a disk of magnetic material mounted on said shaft and arranged to have a rolling engagement with the main driving-shaft of the motor, said shafts and said disk being so positioned with respect to the retarding-magnet, that they are magnetized thereby.

18. In an electric motor a means for producing a short magnetic flux, lagging by substantially ninety degrees behind the flux due to the series winding on non-inductive load, comprising, in combination, a core of magnetic material constituting a nearly-closed magnetic circuit, a winding thereon connected across the mains, and a mass of conducting material interposed between the poles of said core.

19. In an electric motor a means for producing a short magnetic flux, lagging by substantially ninety degrees behind the flux due to the series winding on non-inductive load, comprising, in combination, a core of magnetic material constituting a nearly-closed magnetic circuit, a winding thereon, comprising a plurality of coils separated from one another, connected and across the mains, and a mass of conducting material interposed between the poles of said core.

20. In an electric motor an armature of conducting material, a short-winding having its magnetic axis so positioned that it does not intersect said armature, and means for diverting a portion of the short-flux toward the armature.

21. In combination in an electric motor, an armature, a series winding having its magnetic axis substantially at right angles to said armature, a short-winding having its magnetic axis substantially parallel to the surface of said armature, and means for diverting a portion of the short-flux toward the armature.

22. In an electric motor an armature of conducting material, a short-winding having its magnetic axis substantially parallel to the surface of the said armature, and means for diverting a portion of the short-flux toward the armature.

23. In an electric motor an armature of conducting material, a short-winding provided with a core of magnetic material having its magnetic axis substantially parallel to said armature, and a body of conducting material, constituting a closed circuit, interposed between the poles of said core.

24. In an electric motor, an armature of conducting material, a short-winding provided with a core of magnetic material having its magnetic axis substantially parallel to said armature, and a body of conducting material interposed between the poles of said core and extending into proximity to the motor-armature, the said body being so extended in other directions that the shortest magnetic path around the body of conducting material is on the side adjacent to the armature.

25. In an electric motor an armature of conducting material, a short-winding provided with a core of magnetic material having its magnetic axis substantially parallel to said armature, and a body of conducting material interposed between the poles of said core, said body having portions extended laterally beyond the said poles on the side away from the armature.

26. In an electric motor, an armature of conducting material, a short-winding provided with a core of magnetic material substantially concentric with said armature, and means for diverting a portion of the short-flux toward the armature.

27. In combination, in an electric motor, a metallic structure, a series winding adjacent to said armature on one side, a short-winding, provided with a core of magnetic material, located on the other side of said armature and having its magnetic axis substantially parallel thereto, said core being so positioned that its free poles lie opposite to said series winding, and means for diverting a portion of the short-flux toward the armature.

28. In combination, in an electric motor, a metallic structure, a series winding adjacent to said armature on one side, a short-winding provided with a core of magnetic material located on the other side of said armature and having its magnetic axis substantially parallel thereto, said core being so positioned that its free poles lie opposite to said series winding, and a body of conducting material, constituting a closed circuit, interposed between the poles of said core.

29. In combination, in an electric motor, a metallic structure, a series winding adjacent to said armature on one side, a short-winding provided with a core of magnetic material located on the other side of said armature and having its magnetic axis substantially parallel thereto, said core being so positioned that its free poles lie opposite to said series winding, and a body of conducting material, constituting a closed circuit, interposed between the poles of said core.

ing, and a body of conducting material interposed between the poles of said core and extending into proximity to the motor-armature, the said body being so extended in other directions that the shortest magnetic path around the body of conducting material is on the side adjacent to the armature.

30. As a means for deflecting flux toward an armature, conducting material in the normal path of said flux.

701,966. SASH-LOCK. JAMES H. THORNTON, Evanston, Ill. Filed July 12, 1901. Serial No. 61,080. (No model.)

Claim.—In a sash-lock, in combination with a window frame and sashes, a casing in the upper sash, a locking-latch pivoted therein, a spring to project the latch to engage the lower sash, a yielding bolt to engage the latch and retain the same when retracted, a push-pin to actuate the bolt to release the latch, and a rib on the stile of the lower sash adapted to strike and pass the push-pin in either direction when either sash is moved and thereby disengage the bolt and release the latch.

701,967. BICYCLE. ALBERT E. TURN, Newfield, Ind. Filed Apr. 2, 1901. Serial No. 54,157. (No model.)

Claim.—1. In a bicycle-frame, a rigid head and seat-post tube, and rigid connection between the bearing of the rear driving-wheel and said seat-post tube, in combination with T-slaves on said head and tube having slots in their interiors, and a rectangular spring-bar secured at its ends in said slots, substantially as set forth.

2. The combination with the head and seat-post tube having tubular portions, of the brace-bar composed of two spaced-apart members pivotally secured to said tubular portions, substantially as set forth.

3. The combination with the head and the seat-post tube, of the T-slaves on said head and tube having their interiors formed with hemispherically-curved ends and slots in said interiors and ends, of the rectangular spring-bar fitted in said slots, and means for holding said bar, said ends of the interiors connecting with the upper and lower surfaces of the bar, substantially as set forth.

701,968. BOTTLE FOR AERATED LIQUIDS. DOMENICO TOSCANI, Cesena, Italy. Filed July 15, 1901. Serial No. 63,457. (No model.)

Claim.—1. A bottle having a mouth and also having at a separate point a reflex integral nipple, said nipple consisting of an outwardly-projecting base portion and an inwardly-projecting reflex portion within and forming a continuation thereof, and adapted at its inner end to serve as a seat for a pressure-valve.

2. The combination with a bottle having a mouth and also having at a separate point a reflex integral nipple, said nipple consisting of an outwardly-projecting base portion and an inwardly-projecting reflex portion within and forming a continuation thereof, of a valve having a yielding portion which seats upon the inner end of said nipple, and a stem rigid with said valve and provided at its outer end with a head.

3. The combination with a bottle having a neck terminating in a mouth, and also having in said neck an integral reflex nipple, said nipple consisting of an outwardly-projecting base portion and an inwardly-pro-

jecting reflex portion within and forming a continuation thereof, of a valve seated upon the inner end of said nipple, and a stem rigid with said valve and housed wholly within said reflex nipple.

701,969. END SUPPORT FOR SPIRAL CONVEYER. JOHN C. VAN ARNOLD, Dallas, Tex. Filed Dec. 17, 1901. Serial No. 58,307. (No model.)

Claim.—1. A clamp for supporting the flights of spiral conveyers having a body portion for engaging the shaft of the conveyor and having arms to be riveted to the flights and means for tightening the said body portion on said shaft and drawing said flights against said shaft.

2. A clamp for supporting the flights of spiral conveyers having a body portion for engaging the shaft of the conveyor, arms to be riveted to the flights, a bolt for tightening said body portion on said shaft and drawing the flights against said shaft, and a set-screw for preventing the said body portion from sliding on said shaft.

701,970. PACKAGE FOR GRAIN PRODUCTS. THOMAS F. WALSH, Bridgeport, Conn. Filed Mar. 26, 1901. Serial No. 100,905. (No model.)

Claim.—1. A cylindrical package of the class described comprising, in combination with the concentrically-disposed rows of parcels of equal length arranged side by side, flexible coverings fitting entirely over the opposite flat sides of the package, a flexible covering encircling the periphery of the package, and common binding means for binding the coverings and holding the packaged parcels under centripetal pressure.

2. A cylindrical package of the class described, comprising, in combination with concentrically-disposed rows of parcels of equal length arranged side by side, flexible coverings fitting entirely over the opposite flat sides of the package, a flexible covering encircling the periphery of the package, binders also encircling the periphery of the package and comprising common means for binding the coverings and holding the packaged parcels under centripetal pressure, and auxiliary binders extending diametrically about the package and engaging with the binders encircling the periphery thereof.

701,971. APPARATUS FOR COOLING STEUPE. WILLIAM WALTER, Rochester, N. Y. Filed Jan. 2, 1900. Serial No. 70,155. (No model.)

Claim.—1. The cooling-receptacle, combined with the cooling-coil mounted therein and comprising the head *a* having the hollow sides *c, d*, and series of hollow sections *e* connecting and in communication with said sides, the heat tubes *b* suspended from said head, the hollow couplings *f* extending vertically through said sides and having the side openings *g, h*, therein, and the hollow couplings *p* extending vertically through said sections *e* and having therein at one side the opening *r*, the said couplings *f* being in communication with the outer leg *s* of the outer side tubes *b*, and the couplings *p* being in communication with the leg *t* of said outer side tubes *b* and also in communication with the legs of the tubes *b* suspended from said sections *e*; substantially as set forth.

2. The receptacle, and the cooling-coil mounted therein, the latter consisting of the head and the maximum heat copper tubes *b* suspended therefrom, the middle portions of said tubes prior to their being bent being concentric with and materially less in diameter than the other portions of the tubes; substantially as set forth.

701,972. CULTIVATOR. THOMAS E. WARNER, Frankfort, Kans. Assignor to Carl L. Swenson, Frankfort, Kans. Filed Sept. 12, 1901. Serial No. 78,372. (No model.)

Claim.—1. In a cultivator, a suitable carrying-frame, a tongue therefor, a ring rigid with the tongue, and beams provided with cultivating appliances at one end and pivotally supported at the other from said ring so as to be capable of vertical movement independent of the ring.

2. A double-row cultivator, having a seat-plank pivotally connected to each cultivating member of the machine; a ring forming a part of each member and a support for one end of the seat-plank; and means for holding the plank across the faces of said rings without impeding its pivoted movement thereon.

3. A double-row cultivator, comprising two tongues, a ring secured to each tongue, a gang of cultivating devices secured to each ring, a seat-plank connecting and supported by said rings, and device for holding the seat-plank in contact with said rings, substantially as described.

4. In a cultivator, a tongue, a ring secured to the upper face thereof depending hangars secured to said ring, a horizontal rock-shaft mounted rotatably in said hangars, a pair of depending wheel-arms adjustably secured on said shaft, ground-wheels mounted upon said wheel-arms, and a depending disk-arm adjustably secured upon said shaft and forming approximately a right angle with said wheel-arms, substantially as described.

5. A double-row cultivator, having a seat-plank pivotally connected to each cultivating member of the machine; a ring forming a part of each member and a support for one end of the seat-plank; and means, movable in the plane of and by the plank and adapted to hold the latter flatly against the faces of the rings.

6. In a cultivator, a transverse rock-shaft, a depending wheel-arm secured thereon, a ground-wheel upon said wheel-arm, a hand-lever mounted above said wheel, a crank operated by said lever, a rod connecting said crank with the lower portion of said wheel-arm, a depending disk-arm secured on said rock-shaft and forming approximately a right angle with said wheel-arm, a disk mounted upon the disk-arm, and a shovel-beam secured to the portion of said disk-arm adjacent to said rock-shaft, and means for throwing forward the center of gravity by moving said wheel-arms toward a vertical position, substantially as described.

7. In a cultivator, a tongue, a ring secured to the upper face thereof, depending hangars secured to said ring, a transverse rock-shaft rotatably mounted in said hangars, a pair of obliquely and forwardly depending wheel-arms secured on said shaft, ground-wheels mounted on said wheel-arms, a hand-lever having its fulcrum secured to said tongue, a pair of crank-arms operated by said lever, rods connecting said crank-arms to said wheel-arms, and cultivating devices secured to said rock-shaft, and extending backward therefrom, whereby said wheel-arms may be pushed back toward a vertical position, for lifting the cultivating devices from the ground and throwing the center of gravity forward with respect to the ground-wheel, by operating said lever, substantially as described.

8. A double-row cultivator, comprising two tongues, a ring secured to each tongue, a gang of cultivating appliances secured to each ring, a seat-plank connecting and supported by said rings, and device slidingly mounted on the rings and adapted for holding the seat-plank in contact with said rings.

9. In a cultivator, a tongue, a ring secured to the tongue, hangars secured to said ring, a rock-shaft journaled in said hangars, wheel-arms secured to said shaft, ground-wheels carried by said wheel-arms, and a disk-carrying frame secured upon said shaft.

10. In a cultivator, the combination of a tongue, a ring mounted on the same, a pivot-pin projecting upward from the tongue centrally of the ring, a seat-plank upon the tongue and pivoted to said pivot-pin, and guides extending transversely of and above said plank and having a sliding connection at their ends with said ring, substantially as described.

11. In a cultivator, the combination of a tongue, a ring mounted thereon, hangars depending rigidly from said ring, a rock-shaft journaled in said hangars, cultivating appliances supported from said rock-shaft, arms depending from the rock-shaft, and ground-wheels carried by said arms, substantially as described.

12. In a cultivator, a suitable carrying-frame, a tongue therefor, a rock-shaft suitably journaled, laterally-adjustable wheel-carrying arms supported from said rock-shaft so as to be capable of movement in a vertical plane with said shaft as their axis, beams diverging rearwardly from the wheel-carrying arms, and provided with cultivating appliances at one end and adjustably secured at their opposite ends to said shaft and adapted to move in a vertical plane as said wheel-carrying arms are likewise moved and said shaft is turned, and means for synchronously effecting the movement referred to of said wheel-carrying arms, said shaft, and said beams, and for holding the latter with their cultivating appliances out of contact with the ground.

13. In a cultivator, a transverse rock-shaft, a plurality of wheel-arms adjustably thereon laterally of the machine, ground-wheels upon said arms, cultivating devices supported from said shaft and adjustable laterally of the machine, a hand-lever mounted on the tongue, a crank-shaft operated by said lever, and rods connecting said crank-shaft with the lower portions of the wheel-arms.

701,978. MEANS FOR DEFINING THE BEAT OF THE LAY OF LOGS. CHARLES E. WARNER, Pittsboro, N. C., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Feb. 8, 1901. Serial No. 52,175. (No model.)

Claim.—1. In a beam, the lay, the breast-beam, and a yielding cushion on one to engage on any yielding part of the other as the lay reaches front center on each forward beat.

2. In a loom, the lay, and a yielding buffer therefor operative to take up lost motion and render the forward beat of the lay uniform.

3. In a loom, the lay, a yielding buffer thereon, and a rigid bumper mounted on a fixed part of the loom, to engage the buffer each time the lay beats up, reducing the jar and defining the forward stroke of the lay.

4. In a loom, the lay, a shuttle adapted to contain a supply of filling, a feeder to intermittently engage the filling as the lay beats up, mechanism controlled by or through the feeder when the shuttle-filling is exhausted to a predetermined extent, and a yielding buffer for the lay, to define and render uniform its forward beat, and reduce shock.

5. In a loom, the lay, an elastic rubber buffer mounted on the front thereof, and a fixedly-positioned rigid bumper in the path of and to engage the buffer as the lay reaches its front center on each forward beat.

701,974. TOBACCO-CUTTER. WILLIAM W. WARDER, Ada, Minn. Filed Feb. 27, 1902. Serial No. 96,961. (No model.)

Claim.—1. The combination of a dotted table, a removable water-receptacle beneath the same, a knife vertically movable in the slot, to enter the receptacle, a spring for elevating the knife above the table, scraper-blades in the path of the knife arranged to be moved by the knife in its downward movement to enter the receptacle, a foot-lever connected with the knife to lower it, and means for locking the foot-lever when depressed to maintain the lowered position of the knife and scraper-blades.

2. The combination of a dotted table, a slightly-removable water-receptacle beneath the same, a knife vertically movable in the slot to enter the receptacle, a spring for elevating the knife above the table, scraper-blades in the path of the knife arranged to be moved by the knife in its downward movement to enter the receptacle, an upright having a slot provided with an offset, a foot-lever connected with the knife to lower it and the scraper-blades and foot-lever moving in the upright slot and engaging the offset to lock the depressed knife and scraper-blades.

701,975. DERRICK. RAYN E. WAVER, Plain, Ohio, assignor of one-half to R. E. Stewart, Baya, Ohio. Filed Aug. 21, 1901. Serial No. 72,702. (No model.)

Claim.—1. In a derrick, a truck, a horizontal frame mounted thereon, side pieces for the frame which side pieces project horizontally rearwardly beyond the truck, derrick-masts, pivotal connections between the masts and the rear ends of the side pieces of the frame, the distance of the pivotal points from the bottom of the masts being such that when the masts are swung upon their pivots in a vertical plane into upright position the bottom of the masts will touch the ground, combined with bracing pivotedly connected with the masts near their upper and lower ends, the arrangement of the masts and bracing being such that they may be folded horizontally upon the truck into parallel relation with each other.

2. In a derrick, a truck, a horizontal frame mounted thereon, derrick-masts, pivotal connections between the rear ends of the side pieces of the frame and the masts, bracing pivotedly connected to the masts near

their top, and pieces adapted to fold into parallel relation and which are pivotedly connected with said masts and with said bracing.

3. In a derrick, a truck, a frame mounted thereon having side pieces which project rearwardly, a shaft journaled in said rearwardly-projecting ends, derrick-masts pivotedly mounted on said shaft, and a drum mounted upon said shaft between said masts.

4. In a derrick, a truck, a frame mounted thereon and having rearwardly-projecting side pieces, a shaft mounted and journaled in said projecting ends of the side pieces, derrick-masts pivotedly mounted upon said shaft, a drum journaled upon said shaft between said masts, bracing pivotedly connected with the masts near their top and pieces adapted to fold into parallel relation and which are pivotedly connected with said masts and with said bracing at bottom.

701,976. REEF-FOLDER. HAROLD WINGGREN, Ryde, England. Filed Sept. 20, 1901. Serial No. 76,914. (No model.)

Claim.—1. The herein-described device comprising a plate or support and a plurality of bars or supplemental supports adapted to be connected therewith at or near its opposite ends and to be held in an inclined position, substantially as shown and described.

2. The herein-described device comprising a plate or support, a bar pivotedly connected therewith at one end and adapted to be held in an inclined position and another bar adapted to be connected therewith at or near the opposite end and to be held in an inclined position, substantially as shown and described.

3. The herein-described device comprising a plate or support, a bar pivotedly connected therewith adjacent to one end thereof and provided with a pivoted pawl operating in connection with transverse notches or recesses formed in said plate or support and another bar adapted to be connected with the plate or support at or near the opposite end and to be held in an inclined position, substantially as shown and described.

701,977. CLOTHES-DRYING APPARATUS. JOHN WILLIAM COVINGTON, Ohio, assignor of one-third to William S. Redgen, Cleveland, Ohio. Filed Mar. 27, 1902. Serial No. 69,164. (No model.)

Claim.—1. A clothes-drying apparatus, comprising a clothes-containing chamber having air-inlets near the bottom, a heater above said

air-inlets, a pipe above said heater, racks above said pipes, pipes above said racks, means for conveying a portion of the air from the bottom pipes through the upper pipes and forcing it down through the racks, and an exhaust intermediate the top and bottom of the said chamber, substantially as described.

2. A clothes-drying apparatus comprising a clothes-containing chamber having air-inlets near the bottom, racks carried by the upper portion of said chamber, a heater above said air-inlets, a suction-pipe above the heater and provided with inlet-openings, a fan on the outside of said chamber and in communication with said pipe, a pipe located in the upper portion of said chamber above the racks and having outlet-openings, said pipe being in communication with said fan, and an exhaust-pipe between the racks and said suction-pipe, substantially as described.

3. A clothes-drying apparatus, comprising a clothes-containing chamber having air-inlets near the bottom, racks carried by the upper portion of said chamber, an elongated heater above said air-inlets, a suction-pipe extending along the entire length above the heater and provided with inlet-openings, a fan on the outside of said chamber and in communication with said pipe, a pipe located in the upper portion of the said chamber above the racks and having openings through said pipe in communication with said fan, and an exhaust-opening in the end of said chamber intermediate the inlet and suction pipes, whereby a portion of the heated air is directed through the clothes, substantially as described.

701,978. ONE-CONTROLLED-DUAL EXHAUSTING AND VENTILATING APPARATUS. DANIEL H. WHAM, Birmingham, N. Y., assignor to Albert L. Weaver, New York, N. Y. Filed Sept. 14, 1900. Serial No. 70,404. (No model.)

Claim.—1. In combination with a gravity-lever extended into the pathway of the discharge-opening of a coal-chute, and which is provided with a coil-revolving disk that registers with said opening, of a spring-controlled longitudinally-movable catch that is ranged to travel over said disk to vary its length, and which is adapted to rest in abutment against said chute, substantially as described.

2. In a coal-chute-closing device comprising a spindle mounted to partially rotate and carrying a rod that extends upward at substantially right angles, a cross-arm projecting from said rod, in a plane horizontally coincident with and into a slot in the side wall of the coal-chute; and a vibrating lever centered on said spindle in range of the travel of the delivery-drum, as and for the purpose set forth.

3. The combination with a main actuating-lever in a coal-operated machine, of a smaller bell-lever pivotedly mounted at one side of the coal-passage of the coal-chute, to prevent one arm that is held by a down-pulling spring, in normal contact with the main actuating-lever, while the other arm thereof is positioned to swing into the coal-passage to arrest a coin dropped therein, when the enter arm is allowed to be pulled down in consequence of the depression of the main actuating-handle, substantially as described.

701,979. MACHINE FOR EXTRACTING COAL IN PIECES FROM MINES. CORRAD WIEHLMANN, Schenckleben, Germany. Filed Apr. 9, 1901. Serial No. 84,988. (No model.)

Claim.—A coal-mining machine composed of a truck, a shaft of angular cross-section projecting laterally therefrom and adapted to cut its way through the coal-bed, a circular saw mounted upon the end of said shaft, a transverse arm in horizontal alignment with the shaft, and a wedge mounted upon said arm back of the saw, substantially as specified.

701,980. RECEPTACLE FOR HOLDING AND DELIVERING AMMONIAC SUBSTANCE. EDWARD C. WITMAN, Malden, Mass. Filed Dec. 19, 1901. Serial No. 90,679. (No model.)

Claim.—1. The combination of a receptacle, a cap therein provided with an aperture, a cover, movable on its end and cooperating with the cap-aperture to form a valve therefor, an opening in the cover, a receiver removably attached to the cover at the opening therein and closed from the outer air, the cover-opening and cap-aperture being so disposed that movement of the cover brings them into and out of register with each other as desired.

2. The combination of a receptacle, a funnel-shaped cap therein provided with an aperture, a cover, movable on its end and cooperating with the cap-aperture to form a valve therefor, an opening in the cover, a receiver removably attached to the cover at the opening therein and closed from the outer air, the cover-opening and cap-aperture being so disposed that movement of the cover brings them into and out of register with each other as desired.

3. The combination of a receptacle, a cap therein provided with an aperture, a cover lined with yielding material and movable on its end and cooperating with the cap-aperture to form a valve therefor, an opening in the cover, a receiver removably attached to the cover at the opening therein and closed from the outer air, the cover-opening and cap-aperture being so disposed that movement of the cover brings them into and out of register with each other as desired.

4. The combination of a receptacle, a cap therein provided with an aperture, a cover, movable on its end and cooperating with the cap-aperture to form a valve therefor, an opening in the cover, a transparent receiver removably attached to the cover at the opening therein and closed from the outer air, the cover-opening and cap-aperture being so disposed that movement of the cover brings them into and out of register with each other as desired.

8. The combination of a receptacle, a cup therein provided with an eccentrically-placed aperture, a cover-cover supporting with the cup-aperture to form a valve therefor, an opening in the cover, eccentrically placed, a receiver removably attached to the cover at the opening therein and closed from the outer air, whereby a turning movement of the cover brings the cover-opening and cup-aperture into or out of register with each other, as desired.

701,981. AUTOMATIC AIR-BRAKE. GRANVILLE T. WOOD, New York, N. Y., assignor, by means assignment, to the Westinghouse Air Brake Company, Pittsburgh, Pa., a Corporation of Pennsylvania. Filed Feb. 5, 1901. Serial No. 44,092. (No model.)

Claim.—1. In an air-brake system, the combination of a train-pipe having a direct communication with two adjacent pistons or valve chambers, a communication between an auxiliary reservoir and a brake-cylinder, a communication between the train-pipe and the brake-cylinder, a restricted exhaust-passage between the brake-cylinder and the atmosphere, a valve device in one of said chambers and adapted to control said exhaust and also admit air from the auxiliary reservoir to said brake-cylinder when such valve device is in its normal condition, and a normally inert valve device in the remaining or second of said chambers and adapted to admit air-pressure sufficient to apply the brake independently of the condition of the first-mentioned valve device in an emergency application, the said restricted exhaust being adapted to restrict the escape of air from the brake-cylinder if the first-mentioned valve device should fail to close the exhaust when an emergency-brake application is made.

2. In an air-brake system, the combination of a passage from the train-pipe, a passage from the brake-cylinder which is smaller or more restricted than said train-pipe passage, and a valve device, consisting of a valve connected with a ported piston, connecting with both of said passages and controlling communication between said train-pipe passage and the auxiliary reservoir and also between said brake-cylinder and the exhaust whereby when it is desired to release the brake, the train-pipe air will have a passage through said ported piston and thence through a large passage-way to the auxiliary reservoir, the brake-cylinder air will have a passage-way through a valve-controlled restricted passage to the atmosphere.

3. A valve apparatus for automatic air-brakes, having in combination two ports or passages communicating with the brake-cylinder, one of said passages being small and from the auxiliary reservoir and the other a large passage from the train-pipe, so that the flow of auxiliary-reservoir air is restricted as compared with the flow of train-pipe air when both are flowing to the brake-cylinder during an emergency brake action, a ported piston actuated in both directions by air-pressure, a stem having one end suitably connected with said piston, and a suitable valve operated by said stem to open and close the passage from the auxiliary reservoir while said piston controls the valve passage from the train-pipe to the brake-cylinder and opens the same for emergency stops only.

4. In an air-brake system, the combination of a passage from the train-pipe, a passage from the auxiliary reservoir which is smaller or more restricted than said train-pipe passage, and a valve device consisting of a valve which is mechanically connected to and moved in both directions by a ported piston, the said valve device connecting with both of said passages and controlling communication between them and the brake-cylinder whereby, when an emergency application of the brake is desired the train-pipe air and the auxiliary-reservoir air, the former at a lower pressure than the latter, will both have passages open to the brake-cylinder as follows: said train-pipe air-pressure being through said piston and thence through a by-path in the valve-assembly, the said auxiliary-reservoir air-pressure being through another path in the valve-assembly and controlled by said valve.

5. A valve mechanism for automatic air-brakes having in combination, a passage leading to the brake-cylinder from the train-pipe, a passage leading to the brake-cylinder from the auxiliary reservoir, which is smaller or more restricted than said train-pipe passage, a ported piston actuated in one direction, by pressure from the train-pipe to close said train-pipe passage, and actuated in the opposite direction by pressure from the auxiliary reservoir to open said train-pipe passage, a stem having one end suitably connected with said piston, and a valve suitably connected with said stem and moved thereby to control said passage between the auxiliary reservoir and the brake-cylinder, while said piston controls the passage between said train-pipe and the brake-cylinder and opens said passage for emergency stops only.

6. In an automatic air-brake system, the combination, with the train-pipe, an auxiliary reservoir, and a valve device, of a second valve device which is adapted to act absolutely independent of the action or inaction of the first-mentioned valve device and only when emergency brake applications are made, both of said valve devices being adapted to admit air from the auxiliary reservoir to brake-cylinder, and a passage from said train-pipe to said brake-cylinder, and controlled by said second valve device.

7. In an air-brake system, the combination of a train-pipe, two valve devices communicating therewith, the piston parts of both of said devices being constantly under the train-pipe air-pressure and each of said devices being adapted to operate absolutely independent of either the action or inaction of the other and each of such devices being adapted to control a passage leading from the auxiliary reservoir to the brake-cylinder.

8. In an air-brake mechanism, the combination of a train-pipe having a connection to a valve-chamber or casing, a communication between said chamber or casing and an auxiliary reservoir, a communication between said chamber or casing and a brake-cylinder, and a normally inert differential piston-valve device located within said chamber or casing and adapted to act when making emergency stops only, and establish a check-valved communication between said train-pipe and said brake-cylinder, the piston of said valve device being actuated by auxiliary-reservoir air-pressure in one direction to open or establish the latter communication, and moved by train-pipe air-pressure to cut off or close said communication, during such movements said device operating free from any other valve device.

9. In an air-brake system, the combination of a train-pipe, an auxiliary reservoir, a brake-cylinder, two valve devices adapted to act absolutely independent of each other, air communication between said train-pipe and the auxiliary reservoir, air communication between said train-pipe and said brake-cylinder, air communication between said auxiliary reservoir and said brake-cylinder and a restricted air-passage between said brake-cylinder and the atmosphere, each of said valve devices being adapted to influence the air movement from said auxiliary reservoir to said brake-cylinder, one of said valve devices operating only during emergency applications of the brake.

10. In an air-brake system, the combination of a valve device, substantially as described, having a ported piston mechanically connected with a valve, a chamber or case for said piston, a chamber for said valve, a passage from the train-pipe to said piston-chamber, a passage from said piston-chamber to the auxiliary reservoir, a passage from said piston-chamber to the brake-cylinder, a restricted passage from said auxiliary reservoir to the brake-cylinder, and a restricted passage from said brake-cylinder to the exhaust-opening, the said piston when at one end of its cylinder forms a part of a communication between said train-pipe and said auxiliary reservoir, said valve in the meantime forming a part of a communication between said brake-cylinder and said exhaust-opening, but when said piston is at the other end of its cylinder it becomes a part of a communication between said train-pipe and said brake-cylinder, said communication being open for emergency stops only, and said valve, in the meantime, opening a communication between the auxiliary reservoir and said brake-cylinder.

11. In an air-brake mechanism, the combination of a train-pipe having a tubular connection to two adjacent valve-chambers or casings, a tubular connection from each of said chambers or casings to a brake-cylinder, a tubular connection from each of said chambers or casings to an auxiliary reservoir, a passage from the brake-cylinder to the atmosphere, a graduating-valve device located within one of said chambers or casings, and a normally inert differential piston-valve device located within the other chamber or casing, the latter valve device being adapted to operate when making emergency stops only, and control the communication between said train-pipe and said brake-cylinder, each piston of said valve devices being actuated by auxiliary-reservoir air-pressure in one direction to open or establish said communications and moved by train-pipe air-pressure in the opposite direction to close or cut off said communications, in operation said valve devices acting absolutely independent of each other.

701,982. APPARATUS FOR CONVERTING ROTARY INTO RECIPROCATING MOTION. ROBERT H. YALE, Des Moines, Iowa. Filed July 26, 1901. Serial No. 73,122. (No model.)

Claim.—1. A device for converting rotary into reciprocating motion, comprising a prime mover, a closed casing containing a rotary piston chamber,

has a rotary piston therein actuated by said motor, tubular connections leading out of said piston-chamber, a reciprocating-piston chamber with which said tubes connect, a reciprocating piston within said last-mentioned chamber, a body of liquid within both said piston-chambers and said connecting-tubes, and valves for deflecting said liquid out of said rotary-piston chamber, through said connecting-tubes and against opposite sides alternately of said reciprocating piston, substantially as set forth.

2. A motion-converter comprising a closed casing, an annular rotary-piston chamber therein, a rotary piston within said chamber, tubular connections forming passage-ways leading from opposite portions of said annular chamber, a reciprocating-piston chamber in the ends of which said tubes connect, a reciprocating piston within said last-mentioned chamber, a body of liquid within both said piston-chambers and said connecting-passages, and sliding valves operated by said rotary piston across said annular chamber, for deflecting the flow of said liquid out of said rotary-piston chamber and against opposite sides alternately of said reciprocating piston, substantially as set forth.

3. A motion-converter comprising a rotary-piston chamber, a rotary piston therein, tubular connections or passage-ways leading out of said chamber, a reciprocating-piston chamber with which said tubes connect, a reciprocating piston within said last-mentioned chamber, a body of liquid within both said piston-chambers and said connecting-tubes, and valves operated by said rotary piston for deflecting the flow of said liquid through said connecting-tubes against opposite sides alternately of said reciprocating piston, substantially as set forth.

4. A motion-converter comprising a prime mover, a rotary-piston chamber, a rotary piston therein, tubular connections or passage-ways leading out of said chamber, a reciprocating-piston chamber with which said tubes connect, a reciprocating piston within said last-mentioned chamber, a body of liquid within both said piston-chambers and said connecting-tubes, valves operated by said rotary piston for deflecting the flow of said liquid through said connecting-tubes against opposite sides alternately of said reciprocating piston, and suitable connections between said valves causing them to operate simultaneously, substantially as set forth.

5. A motion-converter comprising an annular rotary-piston chamber, a rotary piston therein, tubular connections or passage-ways leading from said annular chamber, a reciprocating-piston chamber with which said tubes connect, a reciprocating piston within said last-mentioned chamber, a body of liquid within both said piston-chambers and said connecting-passages, valves operated across said annular chamber for deflecting the flow of said liquid against opposite sides alternately of said reciprocating piston, and a rod connecting said valves to cause them to operate in unison, substantially as set forth.

6. A motion-converter comprising a rotary-piston chamber, a piston within said chamber, a reciprocating-piston chamber, a reciprocating piston therein, passage-ways connecting said chambers, a body of liquid within said chambers and said connecting-passages, and valves for directing the movement of said liquid out of said first-mentioned chamber through said passage-ways and against opposite sides alternately of said reciprocating piston, substantially as set forth.

701,983. STROKE-REGULATOR. ROBERT H. YALE, Des Moines, Iowa. Filed Aug. 20, 1901. Serial No. 73,572. (No model.)

Claim.—1. The combination with a reciprocating rod for communicating power from a prime mover to a machine to be operated, of a stroke-regulator adapted to be interposed between two sections of said rod, the same comprising a casing and a body of liquid therein, said body of liquid forming a cushion or abutment between the rod-termini, and said casing being capable of collapse and expansion, to reduce or increase longitudinally the space occupied by said liquid and the distance between said rod-termini, substantially as set forth.

2. The combination with a reciprocating rod for communicating

power, of a stroke-regulator for regulating the amount of work performed per stroke of said rod, the same comprising a casing interposed between two sections of said rod, said casing containing two chambers, a pressure-chamber and a relief-chamber, connected with each other by a passage-way, said pressure-chamber being held between the oppositely-extended rod-termini, and being capable of collapse and expansion, to vary the longitudinal distance between said terminus, a body of liquid within said chambers, and means for controlling the capacity of said passage-way, substantially as set forth.

3. In a stroke-regulator, the combination of the rod divided into two sections, the frames forming the termini of said rod-sections, the casing carried by said frames, a pressure-chamber within said casing, a body of liquid within said chamber, forming an abutment between the power and the work, a relief-chamber, a valve-controlled passage-way between said chambers, and means for collapsing and expanding the pressure-chamber, to vary the length thereof and the longitudinal distance between said rod-sections, substantially as set forth.

4. In a stroke-regulator, the combination of the two sections of the rod, the casing having a pressure-chamber and a relief-chamber therein, said pressure-chamber being held between the oppositely-extended rod-termini, and being capable of collapse and expansion, to vary the longitudinal distance between said terminus, a body of liquid within said chambers, a passage-way connecting said chambers, and a valve controlling said passage-way adapted to close and prevent the liquid from passing out of the pressure-chamber when the pressure is strong, and to remain open and permit the liquid to pass into the relief-chamber when the pressure is weak, substantially as set forth.

5. In a stroke-regulator of the character described, the combination of the casing having two chambers with a body of liquid therein, one of said chambers being collapsible and held between the rod-termini, so as to form a variable abutment between the power and the work, a passage-way between said chambers, a valve controlling said passage-way, and means for retarding the movement of said valve when pressure is applied thereto by said liquid, substantially as set forth.

6. In a stroke-regulator, the combination of the two sections of the rod, the casing, the collapsible pressure-chamber therein, the relief-chamber, the body of liquid within said chambers, the valve-controlled passage-way between said chambers, the terminal frame connected to the power-section of the rod and supporting the casing, and the terminal frame connected to the working section of the rod and carrying the partition and valve interposed between said chambers, substantially as set forth.

7. The combination with a source of power and a reciprocating rod actuated thereby of a stroke-regulator attached to and forming, with said rod, a connection between said power and the device to be operated, said regulator comprising a casing and a body of liquid therein, oppositely-extended termini connected with the power and the work respectively, said body of liquid forming a cushion or abutment between said termini, and said casing being capable of collapse and expansion, to reduce or increase longitudinally the space occupied by said liquid and the distance between said termini, substantially as set forth.

701,984. PILLOW-CHAM HOLDER. MARY A. YEMER, Chicago, Ill. Filed Oct. 4, 1900. Serial No. 23,097. (No model.)

Claim.—1. In a pillow-chamber holder, the combination of two clamping portions each having projecting ends, a rod spanning a projecting end of

each clamping portion, clamping-screw mechanism for holding the clamping portions in position on a bed, and a removable supporting-bar provided with projections at an angle with the main body portion thereof mounted non-rotatably in the sockets, substantially as described.

2. In a pillow-sham holder, the combination of two circular metallic clamps each having projecting ends one of which for each clamp is provided with a socket, clamping mechanism for holding each clamp in position on a bedstead, and a non-rotatable supporting-bar having two downwardly-projecting portions removably mounted in the sockets, and provided with means for securing the pillow-sham thereto substantially as described.

3. In a pillow-sham holder, the combination of two circular metallic clamps each having projecting ends one of which for each clamp is provided with a socket, clamping-screw mechanism for holding each clamp and socket adjustably in position on the posts of the bedstead, a one-piece web-covered removable supporting-bar having inwardly and downwardly projecting ends non-rotatably mounted in the sockets, substantially as described.

701,985. MOPPING DEVICE. HARRISON F. ASKERRAN, Cleveland, Ohio. Filed May 12, 1901. Serial No. 60,104. (No model.)

Claim.—1. In mopping-machines, a pair of continuously-moving mops, and means for driving the same in reverse directions in combination with means for wringing the mops while moving in contact with each other, substantially as set forth.

2. In mopping-machines, a suitable supporting-frame, endless mops movably held thereon, and means for causing said mops to travel in different directions in combination with suitable carrying-rollers for said frame, and means for controlling the position of the frame on said rollers, substantially as set forth.

3. In mopping-machines, a suitable supporting structure, endless webs of moisture-absorbing material movably held thereon, and means for causing said webs to travel in different directions in combination with rolling supports for said structure, and means for controlling the position of the structure on each support whereby either one of said webs may be brought into action, substantially as set forth.

4. In mopping-machines, a pair of mops running in contact with each other between wringer-rolls, a pair of tanks located in operative relation to the wringer-rolls, means for directing the extracted water into either tank, and means for delivering water in advance of either mop, in combination with means for movably supporting the mops tanks &c., and suitably controlling constructions whereby either mop may be brought into operation, substantially as set forth.

5. In mopping-machines, a pair of continuously-moving mops, means for wringing said mops simultaneously, and means for moving them in reverse directions, in combination with means adapted to bring either mop into action upon a surface to be mopped, substantially as set forth.

6. In mopping-machines, a movable structure, supporting-rollers therefor, and a pair of mopping devices secured thereto, in combination with a controlling-handle pivotally secured to the structure and means for

removably holding the same in extreme positions whereby either of the mopping devices may be brought into action, substantially as set forth.

7. In mopping-machines, a continuously-moving fabric, rollers for supporting the same, an enlarged cross-section of said fabric extending lengthwise thereof, and companion pieces of the rollers formed of smaller diameter, substantially as set forth.

701,986. TERMINAL FOR ELECTRIC FURNACES. EDWARD S. ASKINSON, Buffalo, N. Y. Filed May 24, 1900. Serial No. 712,000. (No model.)

Claim.—The combination with a graphic carbon electrode, of a connector comprising a plate, means for connecting the electrode and connector, a flange on the connector, and a plate secured to the flange forming in connection therewith and the connector a tank, substantially as described.

701,987. NON-REFILLABLE BOTTLE. URBAN S. ALB, Baltimore, Md., assignor of thirteen-twentieths to Augustus M. Danhard, Frederick Danhard, and William R. Engel, Baltimore, Md. Filed Sept. 20, 1901. Serial No. 73,004. (No model.)

Claim.—1. In a non-refillable bottle, the combination with the neck of the bottle having beads therein; of the cap or head having a transverse opening through the same, a flat spring passed through said opening so that its ends project beyond opposite sides of the head; together with the valve stopper comprising the tube forming a valve-seat, a valve-plug having a stem, spiders forming guides for the valve-plug, a flange washer at the under side of the valve-plug, and a cork ring encircling the lower end of the tube, substantially as shown and described.

2. In a non-refillable bottle, the combination with the bottle, of a cap or head having springs adapted to engage a head in the neck of the bottle, a valve stopper comprising the tube D forming a valve-seat and having an internal groove, a valve-plug provided with a stem extending through the tube, a spider inserted in the tube and engaging the groove, a second spider embracing the lower end of the tube, and a cork ring placed over the lower spider, said spiders forming guides for the stem of the valve-plug; together with a spring adapted to move the valve-plug to its seat, substantially as shown and described.

3. In a non-refillable bottle, the combination with the bottle, of a cap or head comprising two disks, one having a T-shaped projection and the other a recess to receive said projection, flanges on one of the disks adapted to be upset upon the projection on the other disk, a flat spring interposed between the disk with its ends projecting beyond the sides of the cap or head; together with a valve stopper consisting of a tube or valve-seat, a valve-plug movable against the upper end of said tube, a stem on the valve-plug having a head at its lower end, spiders for guiding the valve-plug and limiting its upward movement, a spring for moving the valve-plug to its seat, and a cork ring around the lower end of the tube, substantially as shown and described.

701,988. AIR BRAKE. DENNIS EMMETT, Detroit, Mich., assignor of one-fourth to Otto Rosenbush, Detroit, Mich. Filed Sept. 7, 1901. Serial No. 74,007. (No model.)

Claim.—1. In an air-brake system, the combination of the double cylinders of different areas, pistons in said cylinders, side rods connecting

said pistons whereby they are caused to travel in unison, one of said pistons being connected with the brake mechanism, means for introducing air under equal pressure into said cylinders between said pistons and the opposed ends of said cylinders and means for reducing the air-pressure in the cylinder of larger area.

2. In an air-brake system, the combination of a double cylinder having a solid dividing-wall and having cylinder-chambers in its opposite ends of unequal area, pistons occupying said cylinders one of which is connected with the brake mechanism, means for connecting said pistons to cause them to travel in unison, means for introducing air under pressure into said cylinders between the pistons and said push-wall and means for reducing the air-pressure in the cylinder of the larger area.

3. In an air-brake system, the combination of two cylinders of different areas divided by a solid push-wall, pistons of different areas occupying said cylinders respectively, means connecting said pistons to cause them to travel in unison, one of said pistons being adapted to be connected with the brake mechanism, an auxiliary reservoir communicating with the cylinder of smaller area between its piston and said push-wall, a train-pipe communicating with the cylinder of larger area and means for reducing the train-pipe pressure below that of the auxiliary reservoir.

4. In an air-brake system, the combination of a duplex cylinder having a solid push-wall between the opposed chambers, the chambers in said cylinder being of unequal area, pistons located in said chambers, said pistons having outwardly-extending piston-rods, cross-heads in which said piston-rods are secured, side rods connecting said cross-heads, one of said piston-rods being adapted to be connected with a brake mechanism, the other of said piston-rods being adjustably connected to its cross-head, ports in said push-wall communicating with the cylinders respectively, an auxiliary reservoir communicating with the port of the smaller cylinder, a train-pipe communicating with the port of the larger cylinder, a main reservoir or source of pressure, communicating with the train-pipe and with the auxiliary reservoir and means for reducing the pressure in the train-pipe.

701,989. LINO-TYPE-MACHINE. JAMES B. BELL, Wilmington, Del. Filed Sept. 12, 1901. Serial No. 76,335. (No model.)

Claim.—1. In a linotype-machine the combination of a plurality of superposed magazines; an independent set of escapements for each magazine; an auxiliary rod and connections between the same and the escapement for each magazine, there being one longitudinal row of auxiliary rods for each magazine, and the several rods being limited one to the rear of the other; a set of operating-keys; a main rod for each key; and means for shifting all of the main rods bodily in a direction from front to rear or vice versa into operative relation with either one of the rows of auxiliary rods to the exclusion of the others, substantially as and for the purposes hereinbefore set forth.

2. In a linotype-machine the combination of a plurality of superposed magazines, an independent set of escapements for each magazine, a set of auxiliary rods for each set of escapements, said auxiliary rods

of each set of escapements above passing up through the magazine or magazines below between the channels therein, connections between the upper end of each auxiliary rod and its appropriate escapement, a set of operating-keys, a main rod for each key, and means for shifting all of the main rods bodily and together into operative relation with either one of the sets of auxiliary rods to the exclusion of the others, substantially as and for the purposes hereinbefore set forth.

3. In combination with the feed-screws of a linotype-distributor, a matrix-conducting chute through which matrices are fed to the feed-screws, having its lower end adjustable lengthwise of the screws with reference to the threads therein substantially as and for the purposes hereinbefore set forth.

4. In a linotype-machine having a plurality of superposed magazines and distributors, one for each magazine, combined with means for delivering a line of matrices from all the magazines to the topmost distributor and passing the same first through that distributor and thence through the other distributors in succession, reversely-arranged distributors each having a ribbed bar and feed-screws located so that the discharge end of the distributor above shall be over and in communication with the entrance end of the distributor next below, and actuated so that the feed-screws of any one distributor shall feed in a direction opposite to that in which the feed-screws of the next adjacent distributor feed, substantially as and for the purposes hereinbefore set forth.

5. In combination with the feed-screws and distributor-bar of a linotype-distributor, a matrix-conducting chute through which matrices are delivered to the feed-screws, and inclined rails by which the matrices as they are fed along are raised into engagement with the distributor-bar, said chute and inclined rails being adjustable bodily and together lengthwise of the feed-screws, substantially as and for the purposes hereinbefore set forth.

6. In combination with the feed-screws and distributor-bar of a linotype-machine, a matrix-conducting chute through which the matrices are delivered to the distributor, having its delivery end directly over the threads of the feed-screw, so that the cam of the delivered matrix shall enter between and engage the threads of the feed-screws and a floor or stop for arresting the further descent of the matrix below this position, substantially as and for the purposes hereinbefore set forth.

701,990. LINO-TYPE-MACHINE. JAMES B. BELL, Wilmington, Del. Filed Nov. 14, 1901. Serial No. 76,331. (No model.)

Claim.—1. In a linotype-machine a plurality of superposed magazines each adapted to receive a full assortment of the characters used in the machine, and an individual distributor having a ribbed bar and feed-screws for each magazine, in combination with a selector having a ribbed bar and feed-screws located above the individual distributors, a separate

chain or matrix passage-way from the collector to each individual distributor, matrices having two sets of perforated teeth, the one to engage the collector-bar and the other to engage the appropriate individual distributor-bar, and means for delivering a line of said matrices to the collector, substantially as and for the purposes hereinbefore set forth.

2. In a linotype-machine, a plurality of magazines and an individual distributor for each magazine, in combination with ribbed collector-bar and feed-curveds for separating out the matrices of each magazine from those of the others, matrices having at the top a perforated set of teeth to engage the ribbed bar of its appropriate individual distributor, and at the bottom a perforated set of teeth to engage the ribbed collector-bar, means for delivering a line of said matrices to the collector-bar, and for conducting the same from said collector-bar each to its own individual distributor, means for turning the matrices upside down, before they engage the main collector-bar, and means for turning the matrices and for and so as to bring them again top uppermost after they have the collector-bar and before they reach their appropriate individual distributors, substantially as and for the purposes hereinbefore set forth.

3. In combination with the collector-bar and feed-curveds, the receiving-box having a ribbed or twisted base, and means for delivering matrices to and pushing them through said box, substantially as and for the purposes hereinbefore set forth.

4. In a linotype-machine the combination with a ribbed distributor-bar and feed-curveds and an elevator and pusher for delivering a line of matrices thereto, of an interspersed receiving-box formed to receive the matrices as they are pushed from the elevator, a central supporting-rib on, a vertically-reciprocating depressor which pushes downward the front matrix of the line into a position to be taken by the feed-curveds, and a shelf for arresting the descent of the matrix at a point where it will be in position as it is advanced by the feed-curveds, to engage the ribbed distributor-bar, substantially as and for the purposes hereinbefore set forth.

5. The combination with the collector-curveds and means for delivering a line of matrices thereto at a level above that at which they will engage the feed-curveds, of a vertically-reciprocating depressor for pushing down the matrices successively into position to be taken by the collector-curveds, and actuating mechanism for said depressor, substantially as and for the purposes hereinbefore set forth.

701,991. VIEL-FASTNER. ARNOLD BRYANT, Newark, N. J. Filed Feb. 11, 1902. Serial No. 93,498. (No model.)

Claim.—1. A veil-fastener comprising a brooch having upon the back the pivot *c* with curved goose-neck feet *e* attached to the edge of the brooch and holding the pivot considerably within each edge, the flap *f* hinged to the pivot and having the thumb-piece *i* concealed within the edge of the brooch and its end bent back sharply from the flap and thus adapted to open the flap at a wide angle, a spiral spring applied to the pivot *c* to

press the flap normally toward the brooch, and the end of the flap being bent toward the brooch to form a step at the edge of the brooch with an open channel extending across the breadth of the brooch between the step and the curved feet *e*, the thumb-piece and the body of the brooch thus being adapted to grasp between the fingers of one hand when applying to the veil.

2. A veil-fastener comprising a brooch having upon the back the pivot *c* with curved goose-neck feet *e* attached to the edge of the brooch and holding the pivot considerably within each edge, the flap *f* hinged to the pivot and having the thumb-piece *i* concealed within the edge of the brooch and its end bent back sharply from the flap and thus adapted to open the flap at a wide angle, a pin projected from the flap obliquely toward the end of the flap, a spiral spring applied to the pivot of the flap to press the same normally toward the brooch, and the casing *d* upon the flap to conceal the spiral spring, substantially as herein set forth.

701,992. POST-HOLE DIGGER. DAVID A. BOWEN, Johnstown, Pa., assignor to David H. Coleman and R. C. Kerr, Johnstown, Pa. Filed Jan. 28, 1902. Serial No. 90,900. (No model.)

Claim.—In a post-hole digger, an expandable shaft comprising two sections divided longitudinally through the head and point and having their meeting faces provided with threaded grooves, mortise-and-tenon connections for the sections and a plug threaded approximately its full length engaging the threads of the sections in such manner as to separate the sections from end to end, substantially as described.

701,993. WATCH-DIAL. WILLIAM BRANK, Villars, Switzerland. Filed Feb. 18, 1902. Serial No. 94,670. (No model.)

Claim.—In combination with the dial and movement-plate *P*, the latter having a recess in its edge, a screw secured to the movement-plate and having a head reaching up and engaging the edge of the dial, the head of said screw being fitted in the recess of the movement-plate and having a projection at its upper edge extending out beyond the edge of the dial and movement-plate whereby said plate with its dial may be fitted into the watchcase, substantially as described.

701,994. VEHICLE-THRILL. HENRY C. BAKER, Lehigh, Iowa. Filed Apr. 28, 1902. Serial No. 100,124. (No model.)

Claim.—1. A vehicle-thrill connection comprising the shaft coupled to the axle at one side of the center line of the vehicle, a whiffletree mov-

ably connected to said shaft, and draft-rod connecting said whiffletree to said axle at equidistant points on opposite sides of said center line, substantially as described.

2. A vehicle-thrill connection comprising the axle having jiff-couplings disposed thereon at equidistant points on opposite sides of the center, the shaft disposed at one side of the center line of the vehicle, means for connecting said shaft flexibly to said jiff-couplings, a whiffletree movably connected to said shaft, and draft-rod flexibly connecting said whiffletree to said shaft-couplings, substantially as described.

3. In a vehicle-thrill connection, the shaft connected to the vehicle at one side of the center, a whiffletree-bearing connected centrally to said whiffletree-shaft, a whiffletree movably connected in said bearing, draft-rod flexibly connected to said whiffletree and engaging said vehicle at equidistant points on opposite sides of its center, substantially as described.

4. In a vehicle-thrill connection, the shaft connected to the vehicle at one side of the center, a whiffletree-bearing having longitudinal slots and connected centrally to said shaft, a whiffletree engaging said bearing and having a pivot-pin loosely engaging said slots, draft-rod connected flexibly to said whiffletree and engaging said vehicle at equidistant points on opposite sides of its center, substantially as described.

701,995. METHOD OF PURIFYING ACETYLENE GAS. JOHN A. BROWN, Bradford, Canada. Filed Dec. 15, 1900. Serial No. 40,411. (No specimens.)

Claim.—1. The process of purifying acetylene gas, consisting in passing gas from the generator through charcoal, having the pores and surface thereof permeated with dry cotton of iron previously deposited from a solution of the same whereby the impurities of the gas are brought by the adhesive property of the charcoal into intimate contact with the metal throughout the pores.

2. In the process of purifying acetylene gas, consisting in passing it over and through a porous and absorbent refractory material, such as lava, having affinity for the residues of the oily hydrocarbons.

3. The method of treating and purifying acetylene gas consisting in first subjecting the generated gas to the action of a condenser, then passing the gas so treated over charcoal treated with a solution of metallic salt, then passing the gas over and through calcium carbide and then through a chamber containing lava or refractory material such as that of which the tips are made as specified.

4. The method of treating and purifying acetylene gas consisting in first subjecting the generated gas to the action of a condenser then passing the gas so treated over charcoal treated with a solution of metallic salt, then passing the gas through calcium carbide and then passing the gas through a chamber containing lava or refractory material such as that of which the tips are made previous to its entrance to the gasometer, then finally subjecting the gas in the gasometer before its entrance to the main to the action of charcoal treated with a solution of metallic salt and to the action of carbide as specified.

5. The method of purifying acetylene gas, which consists in passing the gas after it has been purified and before it enters the main into contact successively with charcoal treated with metallic salt, calcium carbide and refractory material such as lava as and for the purposes specified.

6. The method of purifying acetylene gas, which consists in passing the gas after it has been purified and before it enters the main into contact successively with charcoal treated with a solution of metallic salt and refractory material, such as lava, as specified.

701,996. STAMP-AFFIXER. BERNARD E. GALTIER, Montreal, Canada. Filed Sept. 24, 1900. Serial No. 36,914. (No model.)

Claim.—1. A device of the character described comprising a platen, a roller, means for guiding or directing a label-strip close to said roller, a gripper mounted on the platen to cooperate therewith, and means for actuating the platen and the gripper, as and for the purposes described.

2. A device of the character described comprising a frame, a roller, a movable affixing-platen, a gripper carried by the platen, means for opening the gripper as the platen is pressed to an affixing position, and a moistener having means adapted to supply moisture to a surface prior to the application of a stamp or label, as and for the purposes set forth.

3. A device of the character described comprising a suitable frame, a platen, a roller disposed adjacent to the path of the platen and above the affixing position thereof, a gripper mounted on said platen to cooperate therewith and adapted to travel with the roller, means for opening the gripper at two periods of its travel with the platen, and a moistener, substantially as set forth.

4. A device of the character described comprising a suitable frame, a platen, a roller, a gripper mounted on said platen and movable therewith through certain parts of the travel of the roller, means for closing the gripper as the platen approaches the roller, means for releasing the gripper prior to the adjustment of the platen to its affixing position, and a moistener, substantially as set forth.

5. A device of the character described comprising a suitable frame, a movable affixing-platen, a roller, means for directing or guiding a label-strip close to said roller, a gripper movable with the platen and occupying a closed relation thereto as it recedes from the roller, whereby the platen and gripper cooperate to draw the label-strip, means for releasing the gripper prior to the platen assuming an affixing position, and a moistener, substantially as set forth.

6. In an affixing implement, the combination with a movable pressure-platen, and means for actuating the same, of a gripper mounted on said platen and movable therewith, and a gripper-actuating mechanism to open the gripper with relation to the platen on the elevation of the latter and to keep the gripper closed on the descent of said platen, substantially as described.

7. In an affixing implement, the combination with a movable pressure-platen, and means for actuating the same, of a gripper loosely mounted on the platen and adapted to rise and fall therewith, means for closing the gripper on its descent with said platen, and means to positively open the gripper on the elevation of the platen, said means cooperating with the gripper-closing means to positively hold said gripper in the closed condition during certain periods of its movement with the platen, substantially as described.

8. In an affixing implement, the combination with a pressure-platen, and actuating means therefor, of a gripper connected with said platen to travel therewith, a crushed shaft connected with the gripper, means for actuating said shaft, and a retractor for the gripper, substantially as described.

9. In an affixing implement, the combination with a pressure-platen, and an actuating means therefor, of a flanged gripper, a yoke, a crushed shaft connected to said yoke and to the gripper, and springs acting against the gripper, substantially as described.

10. In an affixing implement, a pressure-platen provided with a receptacle and with a moistening-pad, and a gripper loosely fitted between said receptacle and the platen to be connected thereto for inversion with the parts, combined with a platen-actuating device arranged to invert the platen on its downward travel, and a gripper-actuating mechanism operable to hold the gripper operative during such inversion of the platen and to release the gripper at the period of pressing the platen upon the work, substantially as described.

11. In an affixing implement, the combination with a pressure-plate, an actuating means therefor and a gripper, of a stamp-slide pivotally mounted adjacent to the path of the platen and yieldable to the movement of the latter, a cutter and means for normally holding the stamp-slide in the path of the platen and in position to supply stamps or labels to the same, substantially as described.

12. In an affixing implement, the combination with a pressure-plate and an actuating means therefor, of a biased foot-plate provided with a guide-face and with fingers for a stamp or label, a cutter adjacent to the path of the fingers, and retractors for said foot-plate, substantially as described.

13. In an affixing implement, the combination of a pressure-plate, an actuating means therefor, a gripper movable with the platen and disposed in gripping relation thereto, gripper-actuating means to hold the latter in active relation to the platen during the descent thereof and operable to release the gripper on the final period of movement of the platen, a stamp-slide normally in the path of the platen, means for yieldably holding the stamp-slide in place, and a cutting device arranged to cover one stamp or label from a strip during the period of descent of the platen and the gripper, substantially as described.

14. In an affixing implement, the combination of a platen, an auxiliary yoke connected therewith, a gripper on the platen, a main yoke having a tube, a cranked shaft between the main yoke and the gripper, a handle, a resistance-screw, and the springs, substantially as described.

15. In an affixing device, a pressure-plate, and a gripper mounted loosely and in co-operating gripping relation to the platen, combined with means for giving reciprocating movement to the platen, and gripper-actuating devices arranged to positively hold the gripper in operative relation to the platen during the descent thereof and to release the gripper from its operative position at the final period in the downward travel of the platen, as set forth.

16. In an affixing device, the combination of a pressure-plate, a gripper movable with and in co-operating gripping relation to said platen, a platen-actuating device, and a gripper-actuating device to hold the gripper in operative relation to the platen during the descent thereof, said gripper-actuating device being operable to release the gripper at the final downward travel of the platen and thereby allow the gripper to be thrown out of operative position by the resistance offered by the surface upon which the label or other device is to be affixed, as set forth.

17. In an affixing device, the combination with a stand, a pressure-plate, and a hand-yoke connected to said platen, of a gripper co-operating with said platen, and another yoke having operative connection with the gripper, said yokes being operable with the platen and the gripper to depress the parts simultaneously and to keep the gripper closed until the platen reaches its affixing position, whereby the strain or pressure on the gripper is relaxed prior to the final downward thrust on the platen and said gripper is free from the stamp or label, as set forth.

18. In a stamp-affixing device, a pressure-plate, a gripper connected loosely thereto and disposed normally in co-operating relation therewith, and a retractor-spring acting against the gripper, combined with means for primarily actuating the platen, and means for actuating the gripper at the same time that the platen is made to rise and fall, said gripper-actuating means opening the gripper at the initial period of its descent with the platen, then closing the gripper into co-operative relation to the platen as the parts continue their downward movement, and finally releasing the gripper at the final period in the descent of the platen, substantially as described.

19. In an affixing device, the combination with a pressure-plate, and means for actuating the same, of a gripper, a gripper-actuating mechanism, a pivoted stamp-slide normally disposed in the path of the platen, and a spring for yieldably holding the stamp-slide in position and permitting it to clear itself on the descent of the platen, substantially as described.

20. In an affixing device, the combination of a stand, a movable affixing pressure-plate, a gripper, means for actuating said pressure-plate and the gripper, a cutter mounted on the stand and having a cross-formed cutting edge disposed adjacent to the path of said platen, and a stamp-slide mounted on the stand for yieldable movement relative to the path of the platen and to the cutter, substantially as described.

21. In an affixing device, the combination of a stand, a movable affixing pressure-plate, a gripper, actuating devices for the platen and the gripper, a cross-formed cutter mounted on the stand adjacent to the path of the platen, a stamp-slide, and retaining-fingers carried by the stamp-slide and disposed on opposite sides of the cross in the cutting edge of said cutter, substantially as described.

22. In an affixing device, the combination of a pressure-plate, a gripper co-operatively related to the platen, yokes having separate connections with the platen and the gripper to actuate the same simultaneously as set forth, and a yieldable heel disposed in the path of the platen and adapted to engage therewith on its return upward movement to normal position, substantially as described.

23. In an affixing device, a pressure-plate provided in rear of its working face with a receptacle having the inclined and perforated wall and arranged to normally enclose an upright position wherein the liquid contents of the receptacle lie away from the perforated wall, and a pad against the perforated wall, combined with a gripper, and means for actuating the platen and the gripper, substantially as described.

24. In an affixing device, a pressure-plate having a receptacle and a pad in rear of the active surface thereof, and a gripper loosely confined between the platen and the receptacle and provided with an element in opposing relation to the platen's active face to co-operate therewith in gripping the article to be affixed, combined with devices for actuating the gripper and the platen, a stamp-slide, and a cutter, substantially as described.

25. In a device of the character described, the combination with a movable affixing-plate, and means for actuating the same, of a gripper movably connected to the platen and held in normal closed position by a retractor, means arranged to guide a label-strip to the gripper and platen in the raised position of the parts, a cutter, and devices disposed in co-operative relation to the gripper for opening the same while in the raised position and for giving the movement to said gripper when depressed with the platen below said cutter.

26. In a device of the character described, the combination with a platen, and means for actuating the same, of a yieldable guide having means actuated by the platen-opening device, whereby the guide is positively thrown out of the path of the platen during certain periods in the movement of the latter, substantially as described.

27. In a device of the character described, the combination with a platen, and means for actuating the same, of a pivoted guide disposed in co-operative relation to the platen-actuating device and provided with a chute through which a stamp or label is adapted to be fed, substantially as described.

701,987. EDUCATIONAL DEVICE. FRANK W. DAVENPORT, Providence, R.I. Filed Feb. 1, 1902. Serial No. 38,032. (No model.)

Claim.—1. Two or more revolvable disks wholly disconnected, having figures on their faces and arranged to display some of the figures on each disk adjacent to some of the figures on the other, so they can be read in order, in combination with means that shall enable the finger by a single movement and by striking individual contact with each disk, to turn them all positively, and exactly a predetermined distance and continue such action indefinitely.

2. Two or more revolvable disks wholly disconnected, and having figures on their faces, and arranged to display some of the figures on each disk adjacent to some of the figures on the other disk so they can be read in order, in combination with means that shall enable the finger, in a single movement, and by making individual contact with each disk, to turn them all positively, and exactly a predetermined distance, and by repeating, cause each disk to make a complete revolution in a different period of time from its fellows.

3. A front plate, a back plate, and a central plate, a revolvable disk bearing figures on its face, pivoted to each plate, and free from connection with the other disks, all so combined that a figure on each disk shall be displayed at an opening in the front plate, and adjacent to figures on the other disks, means for causing at pleasure one or more of the figures at the point of display, and means to enable the finger by a single movement, and by making individual contact with each disk, to turn them all positively, and a predetermined distance and continue such action indefinitely.

701,998. GARMENT-SUPPORTER. FLETCHER DOUGLAS, Cleveland, Ohio, assignor to Peter W. Ward and Albert E. Collingsbourne, Cleveland, Ohio. Filed Oct. 7, 1901. Serial No. 77,314. (No model.)

Claim.—1. A garment-supporter comprising the combination with two relatively slidable members, of means for securing each member to each other, each member jointly forming fastening devices at each end of the supporter.

2. A garment-supporter comprising the combination of two relatively slidable members, means for securing each member to each other, contiguous ends thereof being provided with a button and keyhole-slot, and jaws respectively, and means for closing each jaw.

3. A garment-supporter comprising the combination of two relatively slidable members, means for securing each member to each other, contiguous ends thereof being provided with a button and keyhole-slot and jaws respectively, and a slidable sleeve engaging both members and adapted to close said jaws.

4. A garment-supporter comprising two fastening devices at opposite ends of the supporter, each device consisting of a pair of spring-jaws and means for closing same, and a button and keyhole-slot the latter being relatively slidable.

5. A garment-supporter comprising two fastening devices at opposite ends of the supporter, each device consisting of relatively slidable flexible metallic members and means for securing same to each other.

701,999. NON-CONDUCTING COVERING FOR PIPE FITTINGS OR JOINTS. JOHN W. FARLEY, Cleveland, Ohio. Filed Jan. 15, 1902. Serial No. 39,378. (No model.)

Claim.—1. A detachable covering for the joints and flanges of sections of covered pipes, comprising a casing with an enlarged central chamber having necks projecting from the ends thereof adapted to be inserted over the ends of the covered pipe-sections, and passages open from end to end of said casing by which a free circulation of air is established through the same, substantially as described.

2. A detachable covering for the joints and flanges of sections of pipes comprising a covering attached to the pipes, the covering on one pipe abutting against the flange thereof, while a space is left between the covering and flange of the other pipe for the purpose of allowing the withdrawing of the bolts from the flanges of the pipe-joints, an enclosing casing having air channels or passages open from end to end, and provided with end portions adapted to fit over the ends of said pipe-coverings, and an enlarged approximately central chamber, substantially as described.

702,000. NON-REFILLABLE BOTTLE. GEORGE FENNER, New York, N.Y. Filed May 4, 1901. Serial No. 54,894. (No model.)

Claim.—1. An improved non-refillable bottle, comprising a body portion, a neck portion and a stopper, said neck portion consisting of an upper part and a lower part, which are integrally connected in a line of severance, the lower part of said neck portion being formed into a seat for said stopper which latter is permanently connected with the upper part of said neck portion by means of a plurality of interior corrugations formed in said upper part of said neck portion.

2. An improved non-refillable bottle, comprising a body portion, a neck portion and a stopper, said neck portion consisting of an upper part and a lower part integrally connected by a plurality of frangible pillars, the lower part of said neck portion being formed into a seat for said stopper which latter is permanently connected with the upper part of said neck portion by means of a plurality of interior annular toothed corrugations formed in said upper part of said neck portion.

702,001. CORK-EXTRACTOR. HERBERT H. HAY, New York, N.Y. Filed Oct. 22, 1901. Serial No. 56,367. (No model.)

Claim.—In a cork-extractor, the combination of a resilient bow or fork, a hollow handle embodying a plurality of open-ended hollow parts, the said open-ended hollow parts being adapted for engagement with each other, one of the said hollow parts being slotted to receive the arms of the bow or fork adapted to be alternately contained within the said handle and to be fitted thereto to extend from the said handle, the middle portion of the bow being adapted to form a bearing against the interior of the hollow handle, substantially as described.

702,001.

702,002. APPARATUS FOR DYEING YARN. JOHN C. HANER, Rastatt, England. Filed Jan. 2, 1902. Serial No. 53,334. (No model.)

Claim.—1. In an apparatus for dyeing or otherwise treating yarn in cup and similar compact form, a casing, a revolving removable annular perforated cage therein, a perforated wall in the said cage having a flange at its bottom resting upon the bottom of the said cage and a liquid-inlet pipe internally adjacent to the said wall, the latter forming an annular space in the said cage which is open at the top, all combined substantially as and for the purpose set forth.

2. In combination, the casing, the driving-shaft depending therein having a conical boss, a hollow cone encircling said boss, a perforated cylindrical cage carried by said boss, a removable annular wall between the cage and cone, and a perforated pipe depending into the space between the cone and annular wall, substantially as described.

702,003. FAN ATTACHMENT FOR BICYCLES. PHILIP E. HANSEN, Carthage, Mo. Filed May 12, 1901. Serial No. 50,912. (No model.)

Claim.—1. A bicycle attachment comprising a support adapted for application to the frame of a bicycle, and a bladed fan-carrying canopy revolvably mounted upon the support.

2. A bicycle attachment comprising a revolvable canopy or sunshade provided on its upper side with blades and on its under side with a fan.

3. A bicycle attachment comprising a support adapted for application to a bicycle-frame, a rotatable socket mounted upon the support, and a bladed fan-carrying canopy having a standard detachably mounted in and rotatable with the socket.

4. A bicycle attachment comprising a support, adapted for application to the frame of a bicycle, and provided with a vertically-disposed opening, a rotatable head having a central opening corresponding to the first-named opening, and provided in its outer face with recesses intersecting the opening, a socket fitted in the corresponding openings and provided with lateral projections to engage the respective recesses to interlock the socket with the head, and a bladed fan-carrying canopy having a standard detachably mounted in the socket and rotatable therewith.

5. A bicycle attachment having a circular bracket provided with a central circular opening, a circular rotatable head mounted upon the bracket and provided with a central opening corresponding to that in the bracket, and with recesses intersecting the opening, a plurality of upstanding members

ginal guards rising from the bracket and embracing the margin of the head, a socket fitted through the corresponding openings and provided with lateral projections fitting in the recesses, pivoted latches upon the head and constructed to lie across the recesses and the projections, a standard removably fitted in the socket and rotatable therewith, and a bladed fan-carrying canopy mounted on the standard.

6. A bicycle attachment having a support provided with a vertical opening and a concentric groove in its upper face, a friction-balls movable in the groove, a rotatable head mounted upon the balls and provided with a central opening registering with that of the support, a standard removably fitted in the said opening and connected with the head, and a bladed fan-carrying canopy mounted upon the standard.

7. A bicycle attachment having a support provided with vertical openings, a sectional socket rotatably mounted in the openings, one or more elastic bands embracing the sections of the socket, and a bladed fan-carrying canopy having a standard clamped within the socket.

8. A bicycle attachment having a support, a rotatable head mounted thereon, a bladed fan-carrying canopy supported upon the head, and a set-screw pivoting the head and frictionally engaging the support.

702,004. ORE-ROASTER. JOHN L. HARRIS, Knoxville, Mo. Filed Dec. 28, 1901. Serial No. 57,317. (No model.)

Claim.—1. An ore-roasting furnace comprising the front and rear walls having feed and discharge openings, floors and partitions arranged within the furnace and dividing the same into upper and lower ovens, and perforated pipes extending within the ovens and connected to a supply of fluid fuel.

2. An oil-burning ore-roasting oven comprising the front and rear walls having feed and discharge openings, the side walls and flooring, and perforated oil-supply pipes arranged directly within the oven at a point near the opposite side walls and comprising the source of fuel-supply to said oven.

3. The combination in an ore-roaster, of the front and rear walls having feed and discharge openings, a flooring dividing the furnace into two or more tiers or ovens, perforated oil-supply pipes arranged along the opposite side walls of each oven at a point near the floor-level, and an auxiliary supply-pipe arranged within the lower oven at a point below the roof thereof.

4. The combination with two superposed ovens, of perforated fuel-supply pipes leading into each oven, the flooring of the upper oven being provided with a passage or flue to permit the escape of gas from the lower oven.

5. The combination of the superposed ovens having inclined floors, and provided with a connecting-flue, an escape-flue leading from the upper oven, and a discharge-chute leading from the lowermost point of the flooring of the lower oven, the chute and flue being disposed in vertical alignment thereby to permit the independent discharge of the contents of either oven.

5. The combination in an ore-roaster, of the lower cooling-chamber 2, superposed ovens arranged thereabove and having communicating flues or passages, oil-supply pipes 18 arranged within each oven at a point near the floor-level, an oil-supply pipe 20 arranged in the lower oven at a point near the top of the same, governing-valves on said pipes, and a removable chute 27 arranged at the front end of the floor of the lower oven, substantially as specified.

702,005. DRAFT-REGULATOR FOR LOCOMOTIVES. OTTO HÄHNEL, Dresden, Germany. Filed Jan. 20, 1901. Serial No. 48,318. (No model.)

Claim.—1. An exhaust-regulator for locomotives, comprising an exhaust-pipe, a valve pivoted therein, a branch pipe connected to the exhaust-pipe, means in the branch pipe to control the valve, and a rod extending through the branch pipe to connect the valve and its controlling means.

2. An exhaust-regulator for locomotives comprising an exhaust-pipe, a valve pivoted therein, a branch pipe connected directly to the exhaust-pipe a valve-seat therein, a valve in the branch pipe, means to hold the said valve in position on the valve-seat, and means extending through the exhaust-pipe and branch pipe to connect the respective valves in the said pipe.

3. An exhaust-regulator for locomotives comprising an exhaust-pipe, a valve located therein, a branch pipe connected to the exhaust-pipe and provided with a valve-seat, a valve in the branch pipe normally held closed by a spring, means to regulate the tension on the spring and means extending through the branch pipe to connect the respective valves.

702,006. WELL-CASING AND STRAINER. JAMES G. RUTHERFORD, Para, Ill. Filed Aug. 2, 1900. Serial No. 28,360. (No model.)

Claim.—1. A tubular well-casing having strainer-holes communicating horizontally with water-bearing strata, closures for the holes, and

strainers adapted to the holes when the closures therefor are removed, substantially as described.

2. A tubular well-casing having strainer-holes communicating horizontally with water-bearing strata, closures-plugs for the holes inside the casing, bolts to hold the closures-plugs in place and strainers having securing-rings, bolt-holes of which coincide with the bolt-holes of the closures-plugs, substantially as described.

3. In a tubular well-casing a diametrically-diminished section secured in place by an intervening ring, and horizontal strainer-tubes insertible through normally closed holes in the diminished section, substantially as described.

4. The combination of a tubular well-casing having holes in its side walls and strainers of smaller diameter than the holes of the casing inserted through each hole from the inside outward and rigidly secured therein.

5. The combination of a tubular well-casing having holes in its side walls, strainers smaller in diameter than the holes of the casing extended through each hole from the inside of the casing outward and flanges on the inner ends of the strainers secured to the inner surface of the casing.

702,007. DEPOSIT CREDIT-BOOK. CHARLES T. DUNN, Akron, Ohio. Filed Mar. 22, 1902. Serial No. 59,426. (No model.)

Claim.—1. An improved account-book, the pages of which have appropriately-headed columns for entries showing the dates and amounts of deposits and withdrawals, with the net balance and date of same and kind of rebate-cards issued, substantially as shown and described and for the purpose specified.

2. The combination with an account-book having columns for entries indicating the dates and amounts of deposit and withdrawals, the net balance resulting therefrom and the date and kind of rebate-cards issued on said net balance, of rebate-cards bearing on their exterior indicia corresponding to the entries on said rebate-column, substantially as shown and described.

702,008. OIL-BURNER. AUGUST JENSEN, San Francisco, Cal. Filed Apr. 12, 1901. Serial No. 55,545. (No model.)

Claim.—1. In an oil-burner, the combination with burner-tubes, an air-supply, and a fuel-feed pipe, of an inclined oil-distributing plate disposed below the discharge end of the fuel-pipe and having its lower edge turned upward to arrest the flow of oil and form a shallow reservoir and the upper portion of said upturned portion having notches with channels leading therefrom down the outer front of the upturned portion.

2. In an oil-burner the combination with burner-tubes, an air-supply, and a fuel-feed pipe, of an inclined oil-distributing plate disposed below the cold pipe and receiving the oil therefrom said plate being curved in the direction of its length and having its lower edge upturned to arrest the oil and form a shallow reservoir which extends transversely across the front end of the plate, and the upper edge of said upturned portion of the plate having notches with tapering channels extending from the bottom of the notches down the outer front of the upturned edge and made deepest at the base of the notches and becoming more shallow

and disappearing at a point above the bottom edge of said upturned portion.

3. The combination in an oil-burner of an exterior air and an interior air and oil pipe, means for supplying and regulating the flow of air through the two pipes, flattened horizontal elongated discharge-mouths for the two pipes approximately in the same vertical plane, an oil-supply pipe leading into the lower burner-pipe at the rear of the discharge-mouth, a declining plate upon which the oil is delivered, said plate having an upturned front with notches formed through the channels connecting with each of said notches extending down the outer front of the upturned portion, said channels having the greatest depth at their junction with the notches and disappearing on the surface-level at points above the bottom of the plate.

702,009. PROCESS OF MAKING CEMENT. FREDERICK C. JOHNSON, Spokane, Wash. Filed July 11, 1901. Serial No. 57,921. (No model.)

Claim.—1. The herein-described method of making Portland cement, which consists in decarbonating a lime-bearing substance, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay, and then agitating the mixture in the presence of a hydrating agent.

2. The herein-described method of making Portland cement which consists in decarbonating a lime-bearing substance, mixing therewith, while in an incandescent state, a suitable quantity of moist silicious clay and then agitating the mixture in the presence of a hydrating agent.

3. The herein-described method of making Portland cement which consists in decarbonating limestone, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay, and then agitating the mixture in the presence of a hydrating agent.

4. The herein-described method of making Portland cement which consists in decarbonating limestone, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay and then agitating the mixture in an air-tight holder in the presence of a hydrating agent.

5. The herein-described method of making Portland cement which consists in decarbonating limestone, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay, then passing the material to an air-tight holder and introducing into the mixture a fluxing agent, and then agitating the mixture in the presence of a hydrating agent.

6. The herein-described method of making Portland cement which consists in decarbonating limestone, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay, then passing the material to an air-tight holder and introducing into the mixture a mixture of silicious soda and then agitating the mixture in the presence of a hydrating agent.

7. The herein-described method of making Portland cement which consists in decarbonating limestone, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay, then agitating the mixture in the presence of a hydrating agent, and effecting thorough commingling of the materials, then molding, then burning, and finally reducing to a pulverulent mass.

8. The herein-described method of making Portland cement which consists in decarbonating limestone, mixing therewith, while in an incandescent state, a suitable quantity of silicious clay, then passing the material to an air-tight holder and introducing into the mixture a binding and fluxing agent, and then agitating the mixture in the presence of a hydrating agent.

702,010. BOTTLE-WASHING MACHINE. JAMES KAYNE, Philadelphia, Pa. Filed Sept. 20, 1901. Serial No. 78,702. (No model.)

Claim.—1. In a bottle-washing machine, a main or driving shaft, a central brush having its axis adjustable in said driving-shaft and forming a yielding support for the base of the bottle, a disk secured to and rotating with said driving-shaft, a series of brushes surrounding the central

brush and each provided with a standard, means for removably fixing said standard to the disk, and means for adjusting said standards in said disk to cause the series of brushes to approach toward or recede from the central brush and driving-shaft.

2. In a machine of the character described, a brush, a standard having a channelled portion adapted to receive and retain the back of said brush, a fin or rib extending along the entire back of said channelled portion to strengthen the standard, a round end formed on the standard beyond the channelled portion, and a rotating dotted disk in which the round end of said standard is adapted to be secured.

702,011. DEVICE FOR REMOVING BROKEN TAPS. JOHN K. YALL, Worcester, Mass., assignor of one-half to John Schroeder, Worcester, Mass. Filed Mar. 15, 1900. Serial No. 96,494. (No model.)

Claim.—1. In a device for removing broken taps, the combination of a holder provided with longitudinal grooves, of tap-engaging bars held in said grooves and capable of sliding therein, means for simultaneously sliding said bars in said grooves into engagement with the grooves in the tap, substantially as described.

2. The combination with a holder provided with longitudinal grooves for a series of tap-engaging bars, tap-engaging bars held in said grooves and capable of sliding therein, a collar for holding said bars and sliding them simultaneously in said grooves, substantially as described.

3. The combination of a holder having longitudinal grooves, tap-engaging bars held in said grooves, a clamping-collar capable of sliding on said holder and clamping the ends of said bars, substantially as described.

4. The combination of the grooved holder, tap-engaging bars held in said grooved holder and capable of sliding therein, a collar engaging said bars, and a sleeve enclosing said holder and bars, substantially as described.

702,013. BOOK-SHOOTING LEAVES WIDE AND NARROW LEAVES. ARTHUR G. KRYSTON, Springfield, Mass., and SUMNER B. KRYSTON, New York, N. Y., assignors to Account, Audit & Assurance Company, New York, N. Y., a Corporation of New Jersey. Original application filed Aug. 18, 1899; Serial No. 737,717. Divided and this application filed Nov. 12, 1901. Serial No. 51,978. (No model.)

Claim.—A book having wide and narrow leaves and formed of unit-sections with an odd-number of narrow leaves in each section, and each section comprising a wide and narrow leaf in one piece with a group of narrow leaves in pairs inserted in the fold of each wide and narrow leaf, and the projecting margin of the wide leaf being reinforced to agree in thickness with the other leaves of the section, substantially as herein set forth.

702,018. APPARATUS FOR DRAWING GLASS. JOHN E. LONNEN, New Kensington, Pa., assignor, by direct and mesne assignments, to James A. Chambers, trustee, Pittsburgh, Pa. Filed Sept. 30, 1900. Serial No. 51,368. (No model.)

Claim.—1. Apparatus for forming glass cylinders, comprising a receptacle for molten glass, means for heating that portion of the body of glass from which the cylinder is drawn, a shield arranged to cut off the heat from the exterior of the cylinder adjacent to the drawing-point, a belt having a fluid-supply pipe connected thereto, and connections for raising and lowering the belt; substantially as described.

2. Apparatus for forming glass cylinders, comprising a receptacle for molten glass, a source of heat arranged to heat that portion of the body of glass from which the cylinder is drawn, a shield arranged to prevent access of the heat to the exterior of the cylinder, a movable belt having a fluid-supply connection, a chilling-ring surrounding the cylinder adjacent to the drawing-point and arranged to cool it by radiation, and means for applying a cooling medium to said ring; substantially as described.

3. Apparatus for forming hollow glass articles, comprising a receptacle for molten glass, a drawing-tool, an annular chilling-ring arranged to surround the article adjacent to the drawing-point and cool it by radiation, means for cooling the ring, and an air-supply channel arranged to supply air to the interior of the article during the drawing operation; substantially as described.

4. In glass-drawing apparatus, a hollow drawing-pipe connected to a source of fluid under pressure, and mechanism for automatically regulating the fluid-supply during the drawing operation; substantially as described.

5. In glass-drawing apparatus, a hollow drawing-pipe connected to a source of fluid under pressure, a valve controlling the fluid-supply, and a connection with a moving element arranged to automatically operate the valve during the drawing operation; substantially as described.

6. In apparatus for drawing hollow glass articles, a receptacle for molten glass, a vertically-movable frame thereover, a drawing-tool detachably fastened to the frame and connected to a source of fluid under pressure, and a cooling-ring surrounding the article adjacent to the drawing-point and arranged to cool it by radiation; substantially as described.

7. In glass-drawing apparatus, a heating-chamber, a glass-containing vessel with its bottom portion within said chamber, and a fluid-cooled ring above the level of the glass in the vessel; substantially as described.

8. In glass-drawing apparatus, a receptacle for molten glass, a heating-chamber arranged to heat the lower part of the receptacle, an annular shielding device, and a water-cooled ring within the shielding device and arranged to cool the article by radiation; substantially as described.

9. In apparatus for forming hollow glass articles, a hollow drawing-tool connected to a source of fluid under pressure, a cooling-ring arranged to chill the outer surface of the article by radiation adjacent to the drawing-point, and means for applying a cooling medium to said ring; substantially as described.

10. In glass-drawing apparatus, a hollow drawing-tool connected to a source of fluid under pressure, a hollow ring arranged to chill the exterior of the article by radiation adjacent to the drawing-point, and connections arranged to cause a flow of cooling fluid through said hollow ring; substantially as described.

11. In glass-drawing apparatus, a receptacle for molten glass, a movable belt, a fluid-cooled chilling device arranged to chill the glass by radiation, a source of heat, and a refractory shield between the chilling device and said heat; substantially as described.

12. In glass-drawing apparatus, a tank-furnace having a forehearth extension, drawing apparatus above the glass in the extension, means for heating that part of the body of glass from which the article is drawn, and a shield arranged to shield the glass adjacent to the point of drawing, from the heat; substantially as described.

13. In glass-drawing apparatus, a tank-furnace having a forehearth extension, drawing apparatus above the glass in the extension, means for

heating that part of the body of glass from which the article is drawn, a shield arranged to shield the article adjacent to the drawing-point from the heat, and a cooling device arranged to chill the article by radiation adjacent to the drawing-point; substantially as described.

14. In glass-drawing apparatus, a hollow fluid-cooled ring, and an annular shield surrounding the same; substantially as described.

15. In apparatus for forming hollow glass articles, a receptacle for molten glass, a drawing device, a duct arranged to supply a fluid to the interior of the article, a cooling-ring arranged to chill the outer face of the article by radiation around its circumference, and means for uniformly applying a cooling medium to said cooling device; substantially as described.

16. In apparatus for forming hollow glass articles, a receptacle for molten glass, a drawing device above one part of the receptacle, means for heating that part of the body of glass from which the article is drawn, a duct arranged to supply a fluid to the interior of the article, a cooling-ring arranged to chill the outer face of the article by radiation around its circumference, and means for supplying a cooling medium to said ring; substantially as described.

17. In glass-drawing apparatus, a tank-furnace having a forehearth extension, apparatus for drawing glass upwardly from the extension and out of contact with any shaping-surface, and means for heating the glass in said extension; substantially as described.

18. Apparatus for forming glass articles comprising a receptacle for molten glass, means for heating that portion of the body of glass from which the article is drawn, a belt for drawing the article, means for shielding the article from the heat, and means for chilling the article by radiation adjacent to the drawing-point during its formation; substantially as described.

702,014. METHOD OF DRAWING GLASS. JOHN E. LONNEN, New Kensington, Pa., assignor, by direct and mesne assignments, to James A. Chambers, trustee, Pittsburgh, Pa. Filed Jan. 3, 1901. Serial No. 42,518. (No model.)

Claim.—1. The method of forming glass cylinders, consisting in drawing a cylinder from a bath of molten glass, heating that portion of the body of glass from which the cylinder is drawn, shielding the cylinder from the heat, and supplying air to the interior of the cylinder during the drawing operation; substantially as described.

2. The method of forming glass cylinders, consisting in drawing a cylinder from a bath of molten glass, heating that portion of the body of glass from which the cylinder is drawn, preventing access of the heat to the exterior of the cylinder, chilling the exterior of the cylinder by radiation adjacent to the drawing-point, and supplying air to the interior of the cylinder during the drawing operation; substantially as described.

3. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, chilling the article by radiation around its entire circumference adjacent to the drawing-point, and supplying air to the interior of the article during the drawing operation; substantially as described.

4. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, preventing access of heat to the exterior of the article, chilling the exterior of the article by radiation around its entire circumference adjacent to the drawing-point, and supplying air to the interior of the article during the drawing operation; substantially as described.

5. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, supplying air to the interior of the article, and increasing the rate of air-supply as the article increases in length; substantially as described.

6. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, supplying air to the interior of the article, and increasing the rate of air-supply as the article increases in length; substantially as described.

terior of the article as it is formed, and automatically regulating the rate of the air-supply as the article increases in length; substantially as described.

7. The method of forming hollow glass cylinders, consisting in lowering a bath into a bath of molten glass, drawing a hollow neck portion, increasing the air-supply, and enlarging the diameter to substantially the diameter of the desired cylinder, and then continuing the drawing operation and supplying air to maintain the cylinder at the desired diameter; substantially as described.

8. The method of forming hollow glass articles, consisting of lowering a hollow bath into a bath of molten glass, drawing a hollow article from the bath, supplying a gaseous fluid to the interior of the article during drawing, covering the lower end of the article from the bath, moving the drawing device with the hollow bath and article suspended therefrom to one side of the bath, lowering the article into horizontal position while attached to the drawing device, and then severing the article from the bath; substantially as described.

9. The method of forming hollow glass cylinders, consisting in lowering into a bath of molten glass a bath of small diameter relatively to the desired cylinder, drawing a glass neck, increasing the air-supply, and expanding the diameter to the desired size, drawing the cylinder, detaching the lower end of the cylinder from the bath, moving the bath with the cylinder suspended therefrom to one side, and severing the reduced neck portion; substantially as described.

10. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, creating a partial vacuum therein to reduce the diameter at the lower end of the article, admitting heat-currents to this reduced portion, and removing the article; substantially as described.

11. The method of forming glass articles, consisting in drawing a glass article from a bath of molten glass, heating that portion of the body of glass from which the article is drawn, shielding the article adjacent to the drawing-point from the heat, and chilling the article by radiation adjacent to the drawing-point during its formation; substantially as described.

12. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, covering the lower end of the article from the bath by admitting heat-currents to the lower portion and then moving the article to one side and covering its upper end from the drawing device; substantially as described.

13. The method of forming glass articles, consisting in drawing a glass article from a bath of molten glass, heating that portion of the body of glass from which the article is drawn, and chilling the exterior surface of the article by radiation adjacent to the drawing-point during its formation; substantially as described.

702,015. GLASS-DRAWING APPARATUS. JOHN E. LONNEN, New Kensington, Pa., assignor, by direct and mesne assignments, to James A. Chambers, trustee, Pittsburgh, Pa. Filed Jan. 3, 1901. Serial No. 42,520. (No model.)

Claim.—1. In glass-drawing apparatus, a ring arranged to float upon a glass-bath, and a shield device arranged to form a sealing-joint with said ring above the level of the bath; substantially as described.

2. In glass-drawing apparatus, a sealing-joint therewith above the level of the glass; substantially as described.

3. In glass-drawing apparatus, a water cooling device, a refractory shield therefor, and a flange with which the shield contacts; substantially as described.

4. In glass-drawing apparatus, an annular water-cooled ring, an annular refractory shield surrounding the same, and a flange ring with which the shield contacts; substantially as described.

5. In glass-drawing apparatus, a floating ring having holding device for retaining it in proper position, a shield arranged to form a cast-leg-joint with the ring, and glass-drawing apparatus arranged to operate within the shielding device; substantially as described.

6. In glass-drawing apparatus, a float, means for holding it in the desired position, a shielding device coacting with the float, and glass-drawing apparatus arranged to act upon the glass shielded by said parts; substantially as described.

702,016. METHOD OF DRAWING GLASS. JOHN E. LEHMAN, New Kensington, Pa., assignor, by direct and mesne assignments, to James A. Chambers, trustee, Pittsburgh, Pa. Filed Oct. 8, 1901. Serial No. 73,122. (No specimen.)

Claim.—1. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, and allowing a flow of gaseous fluid through the interior of the article; substantially as described.

2. The method of forming hollow glass articles, consisting in drawing the hollow article from a bath of molten glass, supplying a gaseous fluid to the interior of the article, and maintaining a substantially constant pressure therein by allowing the fluid to escape when the pressure rises above a determined limit; substantially as described.

3. The method of forming hollow glass articles, consisting in drawing a hollow article from a bath of molten glass, continuously supplying a gaseous fluid to the lower end of the article being drawn, and automatically withdrawing the fluid from the upper end of the article when the pressure rises above a certain limit; substantially as described.

4. The method of drawing glass articles, consisting in feeding glass to a receptacle, drawing an article therefrom while shielding the article from heat adjacent to the drawing-point, covering the article from the bath, and then heating the surface of the bath; substantially as described.

5. The method of drawing glass articles, consisting in supplying glass to a receptacle, heating the receptacle, raising the receptacle to cut off the heat from the drawing-point, drawing the article from the bath, and then lowering the pot and heating the surface of the glass therein; substantially as described.

6. The method of forming hollow glass articles, consisting in drawing the hollow article from a bath of molten glass, allowing a circulation of gaseous fluid through the interior of the article, and chilling the outer face of the article at or near the drawing-point; substantially as described.

702,017. APPARATUS FOR DRAWING GLASS. JOHN E. LEHMAN, Allegheny, Pa., assignor, by direct and mesne assignments, to James A. Chambers, trustee, Pittsburgh, Pa. Filed Jan. 10, 1902. Serial No. 82,122. (No model.)

Claim.—1. In apparatus for drawing hollow glass articles, a receptacle arranged to contain a bath of molten glass, and a drawing-tool, and

parts (the receptacle and drawing-tool) having a fluid inlet and outlet arranged to allow the circulation of gaseous fluid through the article being drawn; substantially as described.

2. Apparatus for drawing hollow glass articles, comprising a receptacle for molten glass having a fluid-port leading upwardly through the glass, a hollow drawing-tool, and means for allowing gaseous fluid to flow through the tool, the article and the port during the drawing operation; substantially as described.

3. In apparatus for drawing hollow glass articles, a hollow bath, mechanism for allowing a circulation of gaseous fluid through the article being drawn, and a relief-valve arranged to open at a certain pressure to allow the fluid to escape; substantially as described.

4. In apparatus for forming glass articles, a furnace, a receptacle for molten glass therein, a drawing-tool, and mechanism for raising and lowering the receptacle within the furnace; substantially as described.

5. In apparatus for drawing glass articles, a furnace, a vertically-movable pot therein arranged to shield the surface of the glass when in its upper position, and means for lowering the pot to allow access of the heat to the surface of the glass; substantially as described.

6. In apparatus for drawing hollow glass articles, a hollow drawing tool or bath, means for allowing flow of gaseous fluid through the article, and a yielding-pronged relief-valve; substantially as described.

7. Apparatus for drawing hollow glass articles, comprising a receptacle arranged to contain a bath of molten glass, a hollow drawing-tool, a fluid-inlet arranged to admit gaseous fluid to the article being drawn, and a fluid-outlet arranged to allow a portion of the gaseous fluid to escape during the drawing operation; substantially as described.

8. In apparatus for forming hollow glass articles, a heated chamber, a receptacle for molten glass located therein, a hollow drawing-tool, a fluid-inlet arranged to admit gaseous fluid to the article being drawn, a fluid-outlet arranged to allow a portion of the fluid to escape, and mechanism for raising and lowering the receptacle; substantially as described.

702,018. CAMERA-SUPPORT. WILLIAM A. HARRAGE, Cleveland, Ohio. Filed Mar. 2, 1901. Serial No. 49,572. (No model.)

Claim.—1. In a support, a leg comprising in its construction two telescoping members slidable one within the other and each provided with a longitudinal slot, each slot being located upon the same side of the leg, and means for adjustably coacting such members to each other.

2. In a camera-support, a leg comprising in its construction two tele-

scoping members slidable one within the other and each provided with a longitudinal slot, each slot being located upon the same side of the leg, each member of said leg having a longitudinal head, and means for adjustably securing such members together.

3. A camera-support comprising a plurality of legs each of which consists of two members slidable one within the other and each provided with a longitudinal slot, each slot being located upon the same side of the leg, a bridge secured to the lower end of each outer member, a thumb-screw passing through the bridge, a nut provided with a leg, a leg on the inner member of each leg, said thumb-screw engaging the nut, substantially as described.

702,019. LIQUID-MEASURING APPARATUS. JAMES HARRIS, BARK AND WILSON P. BARKER, Bradford township, Victoria, Australia. Filed Jan. 18, 1902. Serial No. 50,043. (No model.)

Claim.—1. In combination, a main tank A, a measuring-tank B, an inlet-valve between the main and measuring tanks, an outlet-valve from the measuring-tank, a float C in the measuring-tank, a trip device, an adjustable pointer connected with the float for operating the trip, a bell-crank R connected to the trip, a pair of bell-crank levers L M and X connected with the bell-crank R and connections from the pair of bell-cranks to the inlet and outlet valves, substantially as described.

2. In combination, a main tank, a measuring-tank connected therewith, an inlet-valve P for the measuring-tank, an outlet-valve P' for the said measuring-tank, a cone-shaped barrel I mounted horizontally, a float C in the measuring-tank, a cord connecting said float and the barrel I, said barrel having a projecting rim F, pointers H and A adjustably connected to said rim, a scale G over which the pointers are adapted to be adjusted, legs O upon which the scale is mounted, segmental slots in the frame with means for adjustably holding the legs thereby, an adjustable cord-guide on one of the legs, a weight connected with the barrel for rotating it reversely so that imparted by the weight of the float, a trip device controlled by the pointer H, connections between the same and the inlet and outlet valves and a signal controlled by the pointer A, substantially as described.

3. In combination with the main and measuring tanks and the inlet and outlet valves for the latter, a float C in the measuring-tank, a trigger-arm U, a trigger-arm T controlled thereby, connections between the said trigger-arm T and the inlet and outlet valves, a rotary pointer H connected with the float and arranged to operate the trigger U, and a weight O for operating the valves reversely when the trigger-arm T is released, substantially as described.

4. In combination, the main and measuring tanks, inlet and outlet valves for the latter, a float, a barrel with connections to the float whereby the barrel is operated, means for rotating the barrel reversely to the movement imparted by the float, a pointer connected with the barrel, a trip arranged to be operated thereby, and connections between said trip and the inlet and outlet valves, substantially as described.

5. In combination, the main and measuring tanks, inlet and outlet valves for the latter, a float, a barrel with connections to the float whereby the barrel is operated, means for rotating the barrel reversely to the movement imparted by the float, a pointer connected with the barrel, a trip arranged to be operated thereby, connections between said trip and the inlet and outlet valves, a second pointer controlled by the barrel and a signal-trip operated thereby to indicate when the measuring-tank is empty, substantially as described.

6. In an apparatus as specified, the combination with a measuring-tank, a cone-shaped or tapering barrel I, mounted horizontally and rotating on a set-screw P and projecting rim such as F; pointers H, A, each having an adjustable clamp and set-screw H' A'; a circular quantitative scale, G, and legs for mounting each scale, O'; segmental slots in a

frame, G', for reception of the feet of each leg secured thereto by bolts and nuts, G"; and adjustable sliding cord or chain guide and screw such as G', G", each barrel and pointers revolving together as one piece by the agency of cord or chain D and counterbalance-weight F, and reversely by float C, as and for the purposes before described and as illustrated.

702,020. SPRING-BALANCE SCALE. JAMES I. MARLER, Cleveland, Ohio, assignor to the Computing Scale Company, a Corporation of Ohio. Filed May 2, 1901. Serial No. 634,694. (No model.)

Claim.—1. In a scale, the combination of a draft-bar supported by oppositely-located lead-counterbalancing springs, a revolvable shaft intermediate said springs, a piston on said shaft, a rack-bar pivoted to said draft-bar and meshing with said piston, a casing containing bearings for said shaft, a downwardly-projecting open-mouthed tube secured to said casing and having its longitudinal center substantially parallel with and meshed between said springs, a piston in said tube, and a piston-rod which is flexibly connected at one end with the piston and at the other end with said draft-bar; substantially as specified.

2. In a scale, the combination of a draft-bar supported by oppositely-located lead-counterbalancing springs, a revolvable shaft intermediate said springs, a connection intermediate said bar and shaft for revolving said shaft, a casing containing bearings for said shaft, expanding means pivotally connected to said casing, a downwardly-projecting open-mouthed tube secured to and projecting within said casing, said tube, springs, and the pivotal point of suspension of said casing being in substantially the same plane, said tube being parallel with said springs, a piston in said tube, and a connecting-rod loosely pivoted to said draft-bar and to said piston; substantially as specified.

3. In a scale, the combination of a draft-bar supported by oppositely-located vertical lead-counterbalancing springs, a revolvable shaft intermediate said springs, a connection intermediate said bar and shaft for revolving said shaft, a casing containing bearings for said shaft, a downwardly-projecting open-mouthed tube secured within said casing and having its longitudinal center substantially parallel with and intermediate said springs, a relatively long piston in said tube, a bearing of authentication material between said piston and the base of said tube, a connecting-rod loosely pivoted to said draft-bar and to said piston; an indicator movable proportionately to the elongation of said springs; and said casing normally inclosing and protecting the parts from dirt, accident or manipulation; substantially as specified.

4. In a scale, the combination of a draft-bar supported by oppositely-located lead-counterbalancing springs whose axial lines are in the same plane with the draft-bar; a revolvable shaft intermediate said springs; a connection between said bar and shaft for revolving said shaft; a casing provided with bearings for said shaft; a cylinder secured within said casing parallel with and between the axis of said springs and extending a portion of the length of said springs; a relatively long piston in said tube; a room in one end of said piston; a connection loosely pivoted at its upper end to said piston intermediate its length and to said casing, said connection being loosely pivoted at its lower end to said draft-bar at a

point below said cylinder; an indicator movable proportionate to the movement of said springs; said casing normally inclosing and protecting said parts; and said springs, draft-bar, cylinder and connection being all in substantially the same plane; whereby a vacuum is formed in said cylinder on the application of a lead to said draft-bar, and whereby the vibration of said shaft and the lateral deflection of said draft-bar are prevented, substantially as specified.

8. In a scale, the combination of a draft-bar supported by oppositely-located lead-counterbalancing springs; means for applying lead to one end of said draft-bar; a reversible shaft intermediate said springs; a piston on said shaft; a rack-bar pivoted to said draft-bar and meshing with said piston; a casing containing bearings for said shaft and supporting said springs therein; an open-mouthed cylinder projecting toward the lead end of said draft-bar and secured within said casing parallel with and intermediate said springs; a relatively long piston in said tube; an opening for the exit and entrance of air to said cylinder; a shell of anti-friction material surrounding said piston; a connecting-rod extending toward the lead end of said draft-bar and being loosely pivoted to said draft-bar and to said piston at points between the axis of said springs; a band in said connection to avoid contact with one or more of said parts; suspending means pivoted to said casing at a point above and between said springs and vertically above the point of connection of the lead-applying means with the draft-bar; and the points of connection of said suspension and lead-applying means, the springs, cylinder, draft-bar, and said connection between said piston and draft-bar being all in substantially the same vertical plane; substantially as specified.

9. In a spring-balance scale, the combination of a spring-suspended draft-bar having on its lower end means for suspending the lead, with a fixed draft-pot cylinder, its piston, and a piston-rod which is flexibly connected at one end with the draft-bar and at the other end with the piston, substantially as specified.

7. In a spring-balance scale, the combination of a cylindrical scale-case having a hole in its lower end, and a spring-suspended draft-bar which extends one through said hole and has on its lower end means for suspending the lead, with a pneumatic tube closed at one end and open at the other, and having at its closed end external wings which are secured to the cylindrical scale-case, a piston movable in said tube, and a piston-rod which is flexibly connected at one end with the piston and at the other end with the draft-bar, substantially as specified.

702,091. PUS FOR JUMPER. EDWIN R. MEAD, Fort Scott, Kans. Filed Dec. 25, 1900. Serial No. 41,574. (No model.)

Claim.—A jumper consisting of a pocket, arranged vertically upon the jumper and having its opening or flap horizontal with relation thereto, a vertical division seam extending from the top toward the bottom of the pocket and a diagonal or horizontal seam extending from said vertical division seam to one of the side seams and closing the top of the pocket to form a sub-pocket therein; substantially as set forth.

702,092. DISK-PLOW ATTACHMENT. FRANK M. KOWEN, Chicago, Cal. Filed Feb. 27, 1902. Serial No. 95,940. (No model.)

Claim.—1. The combination with a disk plow of front and rear bearing and guide wheels, inclined axes upon which said wheels are turnable, said axes being swiveled and turnable with relation to the main frame, lever connections with each of said axes and connections between said levers and a single hand-lever whereby both wheels are turned simultaneously and in the same direction.

2. The combination with a disk plow and the frame thereof of front and rear bearing-wheels, axes swiveled and turnable in the main frame upon which said wheels are journaled, oppositely-moving levers by which said axes are turnable to change the direction of travel of the wheels, a hand-lever, connections between the first-named levers and said hand-lever at points above and below the fulcrum of the latter whereby both wheels are actuated therefrom and in the same direction, and means for holding the hand-lever at any point of adjustment.

3. The combination in a disk plow of inclined front and rear bearing and guide wheels, means by which the line of travel of said wheels is simultaneously changed in the same direction, the bearing-wheel mounted upon the crank-axis upon the left side of the plow, means for raising and lowering the frame thereon, a bracket in which the standard of the inclined front bearing-wheel is slidable and a lever and connections with said standard whereby the front portion of the frame may be raised and lowered.

4. In a disk-plow front, inclined rear and side bearing-wheels, means for raising and lowering the frame with relation to the front wheel consisting of a yoke fixed to the front of the frame, a vertical standard slidable through the yoke at the lower end to form an angular shaft upon which the front wheel is journaled, a horizontal arm projecting from the upper part of the standard, a lever fulcrumed to the frame and a rod connecting the lever with the outer end of the horizontal arm of the standard, and means for holding the lever at any point of adjustment.

5. A disk plow and the frame thereof, a pole pivoted to the front and having a removable locking-bolt, a yoke fixed to and projecting to one side of the pole, a front bearing-wheel having an angularly-disposed shaft and vertical standard swiveled and turnable in the bracket, a lever-arm projecting from the standard and a second lever pivoted upon the frame and connections whereby said lever acts to turn the front wheel and its standard.

6. The combination with a disk plow and the frame thereof of a pivoted swinging draft-pole, a bracket fixed to and projecting from one side thereof, a front bearing-wheel having an inclined axle and a vertical standard turnable in the bracket, a lever-arm projecting from the standard, a second lever-arm and a slidable connection between it and the standard-lever, said second lever carried upon the main frame and acting to turn the bearing-wheel and its standard with greater speed than the movement of the pole by which it is actuated.

7. The combination with a disk plow and frame thereof of a pole pivoted to the front having a fixed yoke or bracket projecting to one side, a bearing-wheel having a vertical standard turnable in the outer end of the bracket, a lever-arm projecting from the standard, a jointed connection between said lever-arm and the fixed portion of the frame whereby the turning of the pole acts to turn the standard and its wheel faster than the movement of the pole.

8. The combination with a disk plow and the frame, front rear and side bearing and guide wheels of a pole pivoted and turnable at the front of the frame, a bracket fixed to and projecting to one side of the pole, a vertical standard bent to form the axle of the front bearing-wheel and standard being turnable and slidable within the bracket, a yoke interior to the bracket, through the axle of which the standard is also slidable, a lever-arm fixed to the standard between the top and bottom of the yoke, a vertical rod fixed to the outer part of the yoke upon which the outer end of the lever-arm is slidable whereby the frame may be raised and lowered, and means by which the frame may be raised and lowered with relation to the bearing-wheel, and a lever fulcrumed upon the pole-pivot having a jointed connection with the yoke interior to the bracket.

702,098. LEATHER-WORKING MACHINE. JOHN E. MILLER, Wilmington, Del. Filed Aug. 2, 1900. Serial No. 25,512. (No model.)

Claim.—1. In a leather-working machine, the combination with a sliding plate, of arms pivotally mounted thereon, a shaft mounted on said plate, eccentric carried by said shaft, connections between the inner ends of said arms and the eccentric, a reciprocating member for rocking said shaft, a crank-shaft carried by said plate, a connecting-rod connecting said reciprocating member and said crank-shaft, a driving-wheel, and a connecting-rod operatively attached to said crank-shaft and driving-wheel, substantially as described.

2. In a leather-working machine, the combination with pivoted arms, of cylindrical shells carried by said arms, one of said shells carrying a blade and the other being provided with a slot to receive said blade, substantially as described.

3. In a leather-working machine, the combination with the pivoted

arms, of shells carried by the outer ends of said arms, one of said shells provided with an opening and the other carrying a plurality of blades, and means for adjusting said blade-carrying shell to bring the blades into operative position, substantially as described.

4. In a leather-working machine, the combination with a driving-wheel, of a sliding plate, arms pivotally mounted upon said plate, a shaft carried by said plate having a crank and crank-pin upon one end thereof, eccentrics fixed upon said shaft, connections between the inner ends of said arms and said eccentrics, a rod reciprocable in said plate and formed with a slot to receive the crank-pin of said shaft, a second crank-shaft mounted in said plate, an operative connection between the crank thereof and said reciprocable rod, and an operative connection between said last-mentioned crank-shaft and the driving-wheel, substantially as described.

702,094. HOOP-LUG. BENJAMIN R. MOORE, San Francisco, Cal. Filed Mar. 4, 1900. Serial No. 54,571. (No model.)

Claim.—1. In a hoop-coupling, a coupling-block having one end adapted to embrace the head of a hoop-bolt, a plurality of bifurcated radially-disposed projections on said block, and means whereby said block may be held behind one or the other of said projections.

2. In a hoop-coupling, a coupling-block having a plurality of outwardly-extending projections arranged in pairs along the length of said block, said block adapted at one end to receive the headed end of a hoop-bolt, and means whereby the bolt may be held behind one or the other of said pairs of projections.

3. In a hoop-coupling, a block having an eye at one end adapted to receive the headed end of the hoop-bolt, said eye consisting of a slot on the under side of said block through which the bolt may be inserted, said slot enlarged in that portion adapted to receive the head, lateral projections on the walls of said enlarged portion between which the body por-

tion of the bolt alone may pass but which bear against the under side of the head and prevent the bolt disengaging from the block when the bolt is drawn forward to its end, and means by which the threaded end of the bolt may be held upon said block.

4. An adjustable hoop-lug including two separable interlocking members one of said members having a plurality of projections and the other member having a single projection to engage either of the projections of the first-named member, and means upon either of said members for engaging an end of a hoop-bolt.

5. An adjustable hoop-lug including two separable members said members having interlocking projections, and means upon the members for engaging an end of a hoop-bolt.

6. An adjustable hoop-lug including two separable members said members having lugs adapted to interlock said lugs formed to receive the hoop-bolt, and means upon either member for engaging an end of said bolt.

7. A hoop lug or coupling including two members having interlocking forked lugs, each of said members adapted to engage an end of a hoop bolt or rod.

8. A hoop lug or coupling consisting of two members each of which is adapted to engage an end of a hoop bolt or rod, hook projections on each of said members, said projections adapted to interlock on either side of the hoop-bolt.

9. A hoop lug or coupling consisting of two members adapted to engage an end of a hoop bolt or rod, one of said members having a plurality of hook projections engaging on either side of the hoop-bolt and complementary hook projections on the other member engaging the hooks on said first member.

10. A hoop lug or coupling consisting of two members, one of said members provided with a perforated end block adapted to embrace the head of the hoop-bolt, a plurality of bifurcated hooks on said member, the other member having an eye in which the other end of the bolt is received and a bifurcated hook projection adapted to engage the hooks on the first member whereby the two members are adjustable in length.

11. A hoop lug or coupling consisting of two members, means upon one of said members by which the eye of the hoop-bolt may be embraced, a plurality of bifurcated hooks or projections on said member, means upon the second member whereby the other end of the bolt is engaged, hook projections on the latter member engaging the hooks of said first member, said interlocking hooks adapted as a knuckle-joint whereby the two members have a limited hinge movement to allow them to adjust themselves to arcs of different radii.

12. The combination with a hoop bolt or rod, of two coupling members, one of said members having an eye portion adapted to embrace the head of the hoop-bolt, a plurality of bifurcated hooks on said member, an eye portion on the second member adapted to engage the other end of the bolt, hooks on the second member engaging the hooks on the first member, said hooks adapted to straddle the hoop-bolt and serving to prevent lateral displacement of the members.

702,095. FRICTION DRIVEN TRUCK. JAMES F. McLEOD, Albany, N. Y., assignor to Consolidated Car-Mounting Company, Albany, N. Y., a Corporation of West Virginia. Filed Dec. 10, 1900. Serial No. 90,562. (No model.)

Claim.—1. In a car-truck, a truck-frame composed of two parts yieldingly connected arranged to overlap each other at the sides of the truck, with means for causing a slight horizontal movement of said parts in reference to each other, substantially as described.

2. In a car-truck, a truck-frame, composed of two parts yieldingly connected, overlapping each other at the sides of the truck, and means adapted to hold said parts in suitable relation to each other, with a pair of drive-wheels mounted in each of the parts of said frame, and means for opening the drive-wheel to revolve by the action of a motor, substantially as described.

3. In a car-truck, a truck-frame, consisting of two parts, arranged to overlap each other at the sides of the truck and yielding connections between the parts of said frame, with means, actuated by the weight of the car-body and load, for causing a slight horizontal movement of the parts of said frame in reference to each other, substantially as described.

4. A car-truck, consisting of a frame composed of two parts arranged to overlap each other at the sides of the truck, a pair of wheels mounted in each part of said frame, a friction-roller mounted to engage with two of said wheels on one side of the truck, with a means for interlocking said frames, substantially as described.

5. In a car-truck, a frame, consisting of two parts, a pair of drive-wheels mounted in each part of said frame, a friction-roller mounted to rotate between and in contact with said wheels, and means for interlocking the parts of said frame in such a manner that the weight of the car-body and the load will tend to draw the wheels in contact with the friction-roller, substantially as described.

6. In a car-truck, two pairs of drive-wheels, pedestals in which said drive-wheels are mounted, the journal-bases in said pedestals provided with a resilient cushion allowing for a certain horizontal give of the drive-wheels, the friction-roller mounted between said drive-wheels, and a means for connecting the pedestals on the drive-wheels on one side of the car in such a manner that the drive-wheels will be drawn in contact with the friction-roller, substantially as described.

7. In a car-truck, a frame, consisting of two parts, a pair of drive-wheels mounted in each part, a friction-roller mounted to rotate between and in contact with said drive-wheels on one or both sides of said truck, a plate secured to each of said parts of said truck-frame on each side of the truck, each plate so arranged and located in reference to the drive-wheels on the part of the frame carrying said plate that pressure brought to bear upon said plate will cause said drive-wheels to move toward the friction-roller, with a means, actuated by the weight of the car-body and load, for bringing pressure to bear upon said plates, substantially as described.

8. In a car-truck, a frame, consisting of two parts, a pair of drive-wheels mounted in each of said parts, a friction-roller mounted to rotate between and in contact with said drive-wheels on one or both sides of said truck, a plate secured to each of said parts of the frame on each side of said truck, so arranged in reference to each other that a wedge-shaped block may be placed in contact with said plates on each side of the truck and that the weight placed on said blocks will tend to cause the parts of the frame to move upon each other, and means for mounting said wedge-shaped blocks in such a manner that the weight of the car-body and load will come upon them, substantially as described.

9. In a car-truck, a frame composed of two parts, a pair of drive-wheels mounted in each part of said frame, a friction-roller arranged to revolve in contact with two of said drive-wheels on one or both sides of said truck, a plate attached to each part of said frame and on each side of said truck, said plates arranged in reference to each other in such a manner as to allow for the entrance of a wedge-shaped block between adjacent faces of said plates on each side of the truck, wedge-shaped blocks mounted in connection with the body of said truck adapted to engage with said plates on each side thereof, all so arranged and connected up that the weight of the car-body and load on the car will tend to draw the parts of the frame horizontally toward each other, substantially as described.

702,026. VALVE REGULATOR AND GOVERNOR. JAMES F. McILROY, Albany, N. Y., assignor to Consolidated Car-Hoisting Company, Albany, N. Y., a Corporation of West Virginia. Filed Mar. 13, 1900. Serial No. 700,856. (No model.)

Claim.—1. In a regulating-valve, a valve-stem, a valve-disk, a seat, with a coil adjacent to the valve-seat provided with a restricted opening leading to the outlet-chamber, so arranged that the flow of the fluid into the coil and its retention there because of the restricted discharge, will tend to force further open the valve from the seat, and permit a greater flow of fluid to the system, substantially as described.

2. In a regulating-valve, a valve-stem, provided with a rounded head, a casting, a diaphragm secured to said casting, legs attached to said casting adapted to engage with said valve-head, permitting the movement of the diaphragm on the valve-stem without destroying the alignment of the valve-stem, substantially as described.

702,027. LOOSE-LEAF ALBUM. ROBERT F. CHRISTOPHER, Philadelphia, Pa., assignor to George S. Lane, William H. Isheter, and Leon B. Holman and said William H. Isheter, executors of William A. Holman, deceased, constituting the firm or copartnership of A. J. Holman & Company, Philadelphia, Pa. Filed Oct. 31, 1901. Serial No. 79,590. (No model.)

Claim.—1. The combination, constituting an album and its stand, of a pack of book-leaves, a box-base substantially flat and rectangular in planular outline, a cover pivotedly mounted thereon, pivoted flaps therefor adapted to support the cover at a distance above the box-base when the device is closed and to swing back the cover and support it in a vertical or upright position when the device is opened, and vertically-disposed angle-shaped leaf-guides secured to said box-base at each of the front corners thereof, adapted to guide the pack of leaves to, and maintain them in place on the box-base, and opening also to support the hinged cover at its front edge in spaced relation to the box-base.

2. The combination with a substantially flat box-base, rectangular in planular outline, of a hinged lid or cover having near its rearward edge two opposite downwardly extending and inclined arms pivotedly united to the box-base and operating as a hinge connection therewith as well as a supporting means for the rear edge of said cover; and vertically-disposed angle-shaped leaf-guides and cover-supports arranged between said box-base and cover at each of the four corners thereof.

3. The combination with a box-base substantially flat, rectangular in planular outline and hollowed out, of a movable cover for said hollowed-out portion, a cover or lid for the box-base with hinges connecting the same, consisting of links adapted to support the cover at a distance above the box-base and to swing it back to, and support it in, an upright position, vertically-disposed angle-shaped guides and supports secured to the corners of the box-base, and a pack of album-leaves adapted to be maintained within the leaf-guides while free to be raised leaf by leaf and thrown back against the inclined hinged cover or lid.

702,028. TELEPHONE SWITCHBOARD. JAMES M. OVERHILL, Elwood, Ind. Filed Dec. 15, 1900. Serial No. 30,961. (No model.)

Claim.—1. The combination with a jack-cocket and a drop, of a longitudinally-movable slide or drop-lifter, a spring for normally holding the slide or drop-lifter in position to receive the drop when it falls and means for raising the end of the slide which receives the drop to restore the latter when a plug is moved in the jack-cocket.

2. The combination with a jack-cocket, a drop, and a plug having a groove or recess therein, of a sliding drop-restorer having a portion entering the jack-cocket, a lever having a part projecting into said cocket and adapted to enter the notch or recess in the plug and means for causing the restorer to rise and restore the drop when said restorer is slid by the insertion into or the withdrawal of the plug from the jack-cocket.

3. The combination with a jack-cocket and a drop, of a slide having an arm depending into the cocket and having a portion to receive the drop, a plug having a groove or recess, a pivoted lever having a part projecting into the cocket and to enter the groove or recess in the plug, whereby when the plug is withdrawn the lever will be made to engage the arm of the slide to move the latter and means for causing the slide to rise when thus moved, and restore the drop.

702,029. APPARATUS FOR UNLOADING SNOWS. DR. THOMAS F. FAYE, Irvington, N. J. Filed June 27, 1901. Serial No. 60,257. (No model.)

Claim.—1. The baling device consisting of the bale-tie *c* having the rings *b* at one end and the cross-bars *e* at set forth, and the chain ties *d* having cross-bars and adapted to loop through the rings, and provided with hooks *f* to engage the chain-links to secure the bale.

2. The baling device consisting of the bale-tie *c* having the rings *b* at one end and the cross-bars *e* at set forth, the chain ties *d* having cross-bars *f* secured thereto by loose connections *g*, and the chain ties being adapted to loop through the rings *b* and provided with suitable fasteners to engage the chain when the bale is tightened.

3. The baling and unloading device, consisting of the bale-ties provided with cross-bars, and one end of each tie being adapted to loop through the other end as set forth, in combination, with the tightening-tackle comprising the ropes *g* attached to one section of the bale-tie, the pulleys *h* attached to the other section of the bale-tie, and a draft-rope *i* for hauling the tightening-tackle and drawing the tie-sections together, and operated as set forth to invert the bale and roll it from its support.

4. The means for unloading snows and similar receptacles, comprising a series of baling devices arranged transversely upon the floor of the snow to support transverse sections of its load, and a draft-rope and tackle for successively tightening the baling device upon each of said load-sections, and rolling over the same to tear it from the remainder of the load and discharge it from the snow.

5. The means for unloading snows and filling in low grounds adjacent to water, comprising the deck for moving the snow, baling device arranged transversely upon the snow under sections of the load with tightening-tackle for tightening and overturning each load-section, posts upon the outer side of the snow with cable and pulley carrier thereon, and means for shifting the carrier upon the cable, a truck with two drums mounted movably thereon, and return-rope and draft-rope extended respectively from the said drums to the carrier-pulley and a bale upon the snow, a connection from the draft-rope to the bale or load-section to draw it upon the ground, and a connection from the return-rope to the baling device to return it from the snow when unloaded, substantially as herein set forth.

6. The means for unloading snows and filling in low grounds adjacent to water, comprising the deck for moving the snow, baling device arranged transversely upon the snow under sections of the load with tightening-tackle for tightening and overturning each load-section, posts upon the outer side of the snow with cable and pulley carrier thereon, and means for shifting the carrier upon the cable, a truck with two drums mounted movably thereon, and return-rope and draft-rope extended respectively from the said drums to the carrier-pulley and a bale upon the snow, a connection from the draft-rope to the bale or load-section to draw it upon the ground, and a connection from the return-rope to the baling device to return it from the snow when unloaded, substantially as herein set forth.

7. The means for unloading snows and filling in low grounds adjacent to water, comprising the deck for moving the snow, means upon the ground for hauling a draft-rope, a baling device arranged transversely upon the deck of the snow under a section of the load, and provided upon the side of the snow furthest from the deck with rings *b* as set forth, a portion of the baling device extended over the top of the bale and looped through each rings to hook up the bale when tightened, tightening-tackle connected with the draft-rope for tightening up the bale and overturning the load-section to tear it from the remainder of the load.

8. The two-part baling device consisting of the bale-tie *c* having the rings *b* at one end and the cross-bars *e* as set forth, and adapted to extend across the deck of a snow, and the bale-tie provided with cross-bars *f* and having the chain portions *d* and hooks *g*, and adapted for connection at one end with the tie *c* and at the other end to have the chains looped through the rings *b* and secured by hooks *g*, as and for the purposes set forth.

9. The two-part baling device consisting of the tie-tie *c* having the rings *b* at one end and the cross-bars *e* as set forth, and adapted to extend across the deck of a snow, and the bale-tie provided with cross-bars *f* and having the chain portions *d* and hooks *g*, and the two parts of the baling device being united by the distal-hooks *h* having an elastic

upon their shank to hold them normally closed, as and for the purposes set forth.

10. The baling device having bale-tie *c* formed of rope with rings *b* at one end and provided at intervals with half-bitches and the cross-bars *e* secured in the half-bitches as set forth, and chain ties attached to the bale-tie and provided with the hooks *g* and adapted to loop through the rings *b*, as and for the purposes set forth.

702,080. PNEUMATIC PIANO. STEPHEN K. REYNOLDS, New York, N. Y. Filed Nov. 15, 1900. Serial No. 24,565. (No model.)

Claim.—1. In a pneumatically-operated keyboard instrument, the combination of an air-chamber having a perforated wall, a series of tubes opening against said perforated wall, a series of air-cylinders connected with the respective tubes and a perforated sheet adapted to pass between the ends of the tubes and the perforated wall, substantially as described.

2. In a pneumatically-operated keyboard instrument, the combination of an air-chamber having a perforated wall, a series of tubes opening against said perforated wall, a series of air-cylinders connected with the respective tubes, a pivoted frame supporting the ends of said tubes, means for forcing said frame toward said wall and a perforated sheet adapted to pass between the ends of the tubes and the wall, substantially as described.

702,081. MUFFLER. ARTHUR C. BEMAN, Toronto, Canada. Filed June 24, 1901. Serial No. 60,903. (No model.)

Claim.—1. In combination with a muffler comprising a plurality of hollow members, each member being provided with an exhaust aperture or mouth, and an intake-aperture, the exhaust apertures or mouths of said members being of the same size and being placed directly opposite to each other and in close proximity to each other, of means for adjusting the distance apart of the exhaust apertures or mouths of said members.

2. In combination with a muffler comprising two hollow members provided with a common neck having a passage-way therein, each member having an intake-aperture opening from said neck, and being further provided with an exhaust aperture or mouth, the said exhaust apertures or mouths of said members being of the same size and being placed directly opposite each other and in close proximity to each other, of means for adjusting the distance apart of the exhaust apertures or mouths of said members, as described.

3. In combination with a muffler comprising two hollow members provided with a common neck having a passage-way therein, each member having an intake-aperture opening from said neck, and being further provided with an exhaust aperture or mouth, the said exhaust apertures or mouths of said members being of the same size and being placed directly opposite each other and in close proximity to each other, the said hollow members being smallest at their intake ends and gradually

getting larger toward their exhaust apertures or mouths, of an adjusting-rod provided with threaded ends passing through said members, near the upper portion of same and at right angles to their exhaust apertures or mouths, as shown, and nuts on the threaded ends of said adjusting-rod and on the inside of said member.

702,082. INDUCTION APPARATUS. WILLIAM SHERRER, Chicago, Ill. Filed Jan. 22, 1902. Serial No. 93,862. (No model.)

Claim.—1. In an induction apparatus, the combination of an inclosing casing, a secondary coil composed of a series of bobbins supported independently in the interior of said casing, and a primary coil arranged centrally within the secondary coil and supported at its ends independently of the secondary coil, substantially as set forth.

2. In an induction apparatus, the combination of an inclosing casing, a secondary coil composed of a series of bobbins supported independently in the interior of said casing, and a primary coil arranged centrally within the secondary coil and supported at its ends independently of the secondary coil by means of orifices formed in the end walls of the main casing, substantially as set forth.

3. In an induction apparatus, the combination of an inclosing casing, a secondary coil composed of a series of bobbins supported independently in the interior of said casing, a primary coil arranged centrally within the secondary coil and supported at its ends independently of the secondary coil, and end bearings secured to the main casing and insulating the ends of the primary coil, substantially as set forth.

4. In an induction apparatus, the combination of an inclosing casing, a secondary coil composed of a series of bobbins supported independently in the interior of said casing, a primary coil arranged centrally within the secondary coil and supported at its ends independently of the secondary coil, and end bearings extending the height of the main casing and adapted to insulate the ends of the primary coil and form conduits for the wire connections, substantially as set forth.

5. In an induction apparatus, the combination of an inclosing casing, a secondary coil composed of a series of bobbins supported independently in the interior of said casing, a primary coil arranged centrally within the secondary coil and supported at its ends independently of the secondary coil, the said primary coil comprising a series of independent windings, and a series of switches and connections for coupling more or less of said windings in series or in parallel, substantially as set forth.

6. In an induction apparatus, the combination of an inclosing casing, a secondary coil composed of a series of bobbins supported independently in the interior of said casing, a primary coil arranged centrally within the secondary coil and supported at its ends independently of the secondary coil, the said primary coil comprising a series of independent windings, and bearings secured to main casing and insulating the ends of the primary coil, and a series of switches and connections for coupling more or less of said primary windings in series or in parallel, substantially as set forth.

702,083. FOLDING STAND OR RACK. JAMES A. SCOTT, Somerville, Mass., assignor of one-half to Charles E. Fuller, Somerville, Mass. Filed Nov. 6, 1901. Serial No. 81,208. (No model.)

Claim.—A postboard stand or rack comprising a front portion, a pair of wings folding back from the sides thereof and interlocked, as in

turned flap at the bottom of the front portion, and interlocked flaps at the bottom of the interlocked wings engaged with the first-mentioned flap and forming together therewith a substantial base for the stand, substantially as described.

702,084. DRAG AND HARROW-PULVERIZER COMBINED. FRANK B. SHAVER, Johnson township, Clinton county, Ind. Filed Dec. 7, 1901. Serial No. 85,054. (No model.)

Claim.—1. In a drag and harrow-pulverizer combined, the combination of the main frame members each having the journal-bearings and also the recesses therein, the clevis attached to each main frame member, the clevis-breaking members having their forward edges in said recesses and separated one from the other, the platform having the narrow rear end and attached to said clevis-breaking members between said main frame members, the rocking cylinder journaled in said bearings, the harrow-teeth in said cylinder, and the arm attached to said cylinder adjacent to the narrow rear end of said platform, substantially as set forth.

2. In a drag and harrow-pulverizer combined, the combination of the main frame members having the inclined lower forward flange, the clevis attached to said members independently, the harrow mounted at the rear ends of said main frame members, the clevis-breaking members attached to said main frame members between said harrow and the rear ends of said lower forward flange, the platform, and the arm attached to the harrow, substantially as set forth.

3. In a drag and harrow-pulverizer combined, the combination of the main frame members, the clevis attached to the forward ends of said frame members, the clevis-breaking members attached to said frame members, the journal-bearings in the rear ends of said frame members, the rocking cylinder mounted in said bearings, the harrow-teeth extending through said cylinder and projecting at each side thereof, the arm secured to said cylinder, the platform on said clevis-breaking members, the notched quadrant on said platform, the operating-lever connected to said quadrant, the lever-latch, the latch-trigger, and the push-rod connected to said lever and also to said arm, substantially as set forth.

4. In a drag and harrow-pulverizer combined, the combination of the main frame members, the clevis attached to the forward ends of said frame members, the clevis-breaking members attached to said frame members, the journal-bearings in the rear ends of said frame members, the rocking cylinder mounted in said bearings, the harrow-teeth extending through said cylinder and projecting at each side thereof, the arm secured to said cylinder, the platform on said clevis-breaking members, the notched quadrant on said platform, the operating-lever connected to said quadrant, the lever-latch, the latch-trigger, and the push-rod connected to said lever and also to said arm, substantially as set forth.

5. In a drag and harrow-pulverizer combined, the combination of the main frame members, the clevis attached to the forward ends of said frame members, the clevis-breaking members attached to said frame members, the journal-bearings in the rear ends of said frame members, the rocking cylinder mounted in said bearings, the harrow-teeth extending through said cylinder and projecting at each side thereof, the arm secured to said cylinder, the platform on said clevis-breaking members, the notched quadrant on said platform, the operating-lever connected to said quadrant, the lever-latch, the latch-trigger, and the push-rod connected to said lever and also to said arm, substantially as set forth.

702,085. DISPLAY TABLE. CHARLES A. SHAVER, Indianapolis, Ind. Filed May 30, 1901. Serial No. 81,128. (No model.)

Claim.—1. In a display-table, a top divided longitudinally into two equal parts, means to permit lateral adjustment and to prevent movement in a longitudinal direction, an auxiliary section of the top underlying the

two first sections of the top when the latter is at its minimum width said auxiliary section having a pair of depending standards with cage being one of their edges, a shaft with a pair of cog-wheels mounted thereon one for each standard the cage wheels engaging the cage of its adjacent standard, a crank to revolve the shaft, a pair of rack-teeth mounted on the shaft, one at each end thereof, a pair of pawls to engage the teeth of the rack-teeth, and a rod connecting the two pawls whereby they will be simultaneously moved, substantially as described and shown.

2. A table with a two-part top, said parts being laterally adjustable and also adjustable vertically as to their adjacent or inner edges, an auxiliary section of top resting under the two-part top and adapted to be elevated into the same plane with or into a plane above said two-part top, a pair of depending standards secured to the auxiliary top having cage on one of their edges, and a crank-shaft, a pair of cog-wheels mounted thereon, one at each end thereof, the cage thereof engaging the cage of its adjacent standard, and means for simultaneously locking and unlocking both ends of the shaft, substantially as described and shown.

3. In a display-table, a top divided longitudinally into two equal parts, said parts having outer side flanges, a frame to support the top having sections to receive the flanges, an auxiliary shaft or top section, a pair of standards connected therewith at opposite ends of the top said standards having cage-like edges, guides to direct the movements of the standards, a crank-shaft with a pair of cog-wheels mounted on said shaft the cage of the said wheels engaging the cage of the adjacent standards and a pair of rack-teeth on said shaft a pair of pawls to engage the rack-teeth, and a rod to which both of the pawls are fixed so as to move simultaneously therewith, as and for the purposes specified.

702,086. FIREMAN'S SHIELD. FREDERICK W. SHUTTER, New York, N. Y. Filed Dec. 14, 1901. Serial No. 86,000. (No model.)

Claim.—1. In a fireman's portable protector, composed of front, side and top flaps, hinged together, a reinforced-brace extending over the front plate and a handle aperture and support in said brace.

2. In a fireman's protector, a vertical plate having an aperture for the passage of a fluid column, a collar about said aperture, a series of radial supports therefor, an annular grooved socket within said collar, and a ball revolvably fitted within said socket, said ball having a handle-bearing aperture.

3. In a fireman's protector, composed of a front plate with side and top plates hinged thereto and extending rearwardly therefrom, a forward support or stop composed of a pair of adjustable props extending from said front plate, in advance thereof.

702,087. MACHINE FOR WORKING STONE-SURFACES. THEODORE STEIGER, Vienna, Austria-Hungary. Filed June 14, 1902. Serial No. 82,512. (No model.)

Claim.—1. A stone-cutting machine comprising a bed having longitudinal rails, vertical guides on said rails, means to simultaneously move the vertical guides, a transverse guide-rail vertically movable in said guides, a tool-holder movable along the transverse guide-rail and rotatably adjustable, and means to rotate a tool held in the holder.

2. A stone-cutting machine comprising a bed having longitudinal

rails, curves therein simultaneously movable, vertical guides on said rails moved by said curves, a vertical curve in each vertical guide said curves simultaneously rotated, a vertically-movable guide-rail a guide in the vertical guides and moved by the curves therein, an adjustable tool-holder movable along the rail a means to longitudinally move the tool-holder and means to mechanically reciprocate the tool, substantially as and for the purposes set forth.

702,088. REGULATION OF SPEED AND POWER ENGINE. BLAKE THOMSON, Swampscott, Mass. Filed Nov. 4, 1900. Serial No. 728,768. (No model.)

Claim.—1. In combination with a variable-speed engine, an automatic regulator acted upon by changes in speed, a cut-off valve, a throttle-valve, means for decreasing the period of opening of the cut-off as the speed rises, and means for correspondingly increasing the opening of the throttle as the closing of said cut-off takes place.

2. In combination with a variable-speed engine, an automatic regulator for governing the engine which acts progressively over a wide range of speed, a cut-off valve, a throttle-valve, and means actuated by the regulator for correspondingly decreasing the period of opening of the cut-off and increasing the opening in the throttle as the speed of the engine rises.

3. In an automatic regulating device for variable-speed steam or vapor engines, the combination of a cylinder a variable cut-off for admitting steam to the cylinder, a valve in the steam-supply pipe adjusted to be slightly open at the start, a speed-responsive device acting automatically, a means actuated by the device, which during the increase in speed, is arranged to vary the cut-off in a manner to diminish the time of steam admission, and also to open the throttle-valve in the steam-supply pipe, and manual means for varying the action of the speed-responsive device during operation.

4. In combination, an engine having a cylinder, a throttle and a cut-off valve with an automatic regulator for maintaining a constant engine torque comprising a speed-responsive device progressively operative over a wide range of speed, means actuated by the regulator as the speed rises for gradually opening the throttle-valve, means for rotating the cut-off valve, and a connection between said means and the regulator whereby as the throttle-valve is opened under an increase of speed, the opening of the cut-off valve is correspondingly decreased at or about the same instant, whereby a new and definite relation of the valves is established for each change in speed.

5. In an automatic regulating device for steam or vapor engines, the combination of a variable cut-off or steam admission, a throttle-valve in the steam-supply pipe adjusted to be slightly opened at the start, a speed-responsive device which, during an increase of speed, adjusts the cut-off so as to diminish the time of steam admission, and also acts to open the throttle-valve in the steam-supply pipe, thereby admitting more steam to the steam-chest of the engine, a manually-operated throttle for turning on and off the steam-supply, a reversing mechanism, and manually-operated means for operating the said mechanism.

6. In an automatic regulating device for steam or vapor engines, the combination of a main throttle-valve, an operating-handle therefor, a subsidiary throttle-valve normally open to a slight extent even when the engine is at rest, a variable cut-off controlling the steam admission to the cylinder, a speed-responsive device, and mechanism for opening the subsidiary throttle, and at the same time acting on the variable cut-off to diminish the steam admission as the speed rises.

7. In an automatic regulating device for steam or vapor engines, the combination of a main throttle-valve, an operating-handle therefor, a subsidiary throttle-valve normally open to a slight extent even when the engine is at rest, a variable cut-off controlling the steam admission to the cylinder, a speed-responsive device, mechanism actuated by the device for opening the subsidiary throttle and at the same time diminishing the

steam admission at the cut-off as the speed rises, and normally-controlled means for adjusting the speed-responsive device for varying the position which it takes under different speeds of running, thereby changing its sensitivity.

8. In an automatic torque-regulator device for steam or vapor engines, the combination of a speed-responsive device, a subsidiary throttle-valve normally opened to a slight extent, poppet-valves for regulating the admission of steam to the engine, means for actuating the valves, and a lever which is acted upon by the speed-responsive device for simultaneously opening the subsidiary throttle and adjusting the same so as to decrease the interval that the admission-valves are opened on an increase in speed.

9. In an automatic regulating device for engines the combination of a main throttle-valve, a handle for actuating the throttle, valves for regulating the admission of steam to the engine, means actuated by the throttle-lever for varying the opening and closing of these valves, a subsidiary throttle-valve arranged to be opened at all times, a speed-responsive device, a pivotally-supported lever acted upon by the speed-responsive device for opening the subsidiary throttle and closing the steam-admission valves, the valves being so arranged that as the throttle-valves open the admission-valves remain closed for a longer period of time, means for opposing the action of the lever, and a spring or its equivalent for adjusting the effect of said means on the lever.

702,089. HOLD-DOWN DEVICE FOR WOODWORKING-MACHINES. JOHN R. THOMAS, Cincinnati, Ohio, assignor to J. A. Fry & Ryan Company, Cincinnati, Ohio, a Corporation of West Virginia. Original application filed May 20, 1901. Serial No. 25,413. Divided and this application filed Dec. 20, 1901. Serial No. 27,081. (No model.)

Claim.—1. In a woodworking-machine, a hold-down device comprising in combination a swinging frame, swinging and solely supported from one side of the machine, with means for rigidly holding the swinging frame above the table of the machine, with a slide for the swinging frame, and means for adjusting the slide for extending a greater or less distance over the table of the machine from said side, and a second slide, with means for adjusting the latter for extending a greater or less height above the table, with means for permitting the swinging of the frame and slides, substantially as described.

2. In a woodworking-machine, a hold-down device comprising in combination a swinging frame overhanging the table of the machine from the side and supported solely from said side, with means at said side for rigidly securing the swinging frame in normal overhanging position, slides for the swinging frame, with means for adjusting the slides on the swinging frame to overhang the table a greater or less distance, and second slides, with means for adjusting the latter toward or away from the table, and means for permitting the swinging frame and slides to be swung upwardly away from the table, substantially as described.

3. In a woodworking-machine, a hold-down device comprising in combination a bifurcated swinging frame, and a post extending between the forks, a clamp for securing the swinging frame rigidly in position, with a pair of slides longitudinally and independently adjustable on the swinging frame, and a pair of secondary slides transversely independently adjustable on the latter, with means for permitting the upward swinging of the frame with the slides thereon away from the table of the machine, substantially as described.

4. In a woodworking-machine, the combination of a frame, a swinging frame swinging from one side of the frame and supported solely from the side of the frame from which it swings, with a pair of slides, one adjustable for extending a greater or less distance over the table of the machine from the side from which the swinging frame swings, and the other adjustable for greater or less height above said table, with said slides and means for adjusting same on said swinging frame.

702,040. SAND-BLAST TUMBLING-BARREL. BENJAMIN C. TILGNER, Jr., Philadelphia, Pa. Filed Sept. 26, 1901. Serial No. 73,485. (No model.)

Claim.—1. In combination with a tumbling-barrel, a support for sand-blast nozzles situated outside of the barrel and two or more blast-nozzles secured to said supports outside of the periphery of the barrel and directed at varying angles into the barrel.

2. In combination with a sectional tumbling-barrel, means for revolving each section, sand-blast nozzles supported between one or more of the sections of the barrel and blast-nozzles secured to said support and directed into the barrel.

3. In combination with a sectional tumbling-barrel, means for revolving each section, and blast-nozzles supported between one or more of the sections of the barrel and blast-nozzles secured to said supports and directed at varying angles into the barrel.

4. In combination with a sectional tumbling-barrel, means for revolving each section, annular stationary rings situated between the barrel-sections and blast-nozzles secured to said rings and directed into the barrel.

5. A sectional tumbling-barrel having three sections, means for revolving said barrel-sections, supports for sand-blast nozzles, situated between two adjacent sections and blast-nozzles secured to said supports and directed into the barrel.

6. A sectional tumbling-barrel having three sections, means for revolving said barrel-sections and sand-blast nozzles directed to act on the inside of the central barrel-section.

7. A sectional tumbling-barrel made up of two or more sections set in line in combination with means for revolving one or more of the barrel-sections and sand-blast nozzles directed into one or more of the revolving barrel-sections.

702,041. APPARATUS FOR DYEING. CHARLES J. WALL, New York, N. Y., assignor to the West Dyeing Company, New York, N. Y., a Corporation of New York. Filed Nov. 14, 1900. Serial No. 26,455. (No model.)

Claim.—1. A dyeing apparatus comprising a reservoir, a dispensing cup or chamber in proximity thereto, a filling-tube extending from the dispensing-chamber into the reservoir, a discharge-tube extending from the lower portion of the reservoir to the upper portion thereof and thence into the dispensing-chamber and means for discharging the liquid from the dispensing-chamber or cup, substantially as set forth.

2. A dyeing apparatus comprising a reservoir for the dyeing liquid, a dispensing chamber or cup removably secured to the reservoir, means for maintaining the liquid at a predetermined height within the dispensing-chamber and means for automatically discharging the liquid from the dispensing-chamber, substantially as set forth.

3. A dyeing apparatus comprising a reservoir for the dyeing liquid, a dispensing chamber or cup removably secured to the reservoir, a filling-tube secured by the said dispensing chamber or cup, means for maintaining the liquid at a predetermined height within the said chamber or cup and means for automatically discharging the liquid from the said chamber or cup, substantially as set forth.

4. A dyeing apparatus comprising a reservoir for the dyeing liquid, a dispensing chamber or cup in proximity to the reservoir, means for filling the reservoir from both top and bottom, a siphon-tube extending from a point within the dispensing chamber or cup to a point within the reservoir near its top and thence to a point near its bottom and means for automatically discharging the liquid from the dispensing chamber or cup, substantially as set forth.

5. A dyeing apparatus comprising a reservoir for the dyeing liquid, a dispensing chamber or cup in proximity to the reservoir, means for maintaining the liquid at a predetermined height within the dispensing chamber or cup, means for automatically discharging the liquid from the dispensing chamber or cup, a sub-chamber for receiving the li-

aid from the dispensing chamber or cup, the said sub-chamber being provided with an overflow-tube and a wick leading from the bottom of the sub-chamber upwardly along the outer wall of the reservoir, substantially as set forth.

702,042. LOCOMOTOR SWITCH-THROWING DEVICE. ARTHUR C. WALTON, Denver, Colo., assignor of one-fourth to Joseph F. Hovick, Allegheny, Pa. Filed Aug. 22, 1901. Serial No. 73,204. (No model.)

Claim.—1. In a locomotor switch-thrower, the combination with a double-acting cylinder and piston, of a right-truck and a left-truck selector connected with said piston; a double-acting controlling-valve for the admission of air to said cylinder; and opening springs for returning said valve to its neutral inoperative position.

2. In a locomotor switch-thrower, the combination with a double-acting cylinder and piston, of a right-truck and a left-truck selector operatively connected with said piston; a double-acting controlling-valve for the admission of air to and exhaust from both ends of said cylinder, the exhaust from both of said ends being normally open and the admission thereto being normally closed; and opening springs for yieldingly maintaining said valve in its normal position.

3. In a locomotor switch-thrower, the combination with a double-acting cylinder and piston, of a right-truck and a left-truck selector operatively connected with said piston; an oppositely-moving controlling-valve for governing the admission of said piston in opposite directions; yielding means for containing said valve in its non-admission position; and opposite selective pistons operatively connected with said valve, to cause either selector to be moved to the operative position.

4. In a locomotor switch-thrower, the combination with a car or carriage adapted to traverse a track, of a double-acting cylinder and piston; a right-truck and a left-truck selector operatively connected with said piston; an oppositely-moving controlling-valve for the motive agent for said cylinder; opening springs tending to contain said valve in its non-admission position; and opposite selective means at one or both ends of said car, operatively connected with said valve.

5. In a locomotor switch-thrower, the combination, with a cylinder and actuating-piston, of a right-truck and a left-truck selector connected with said piston; and means for operating said piston.

6. In a locomotor switch-thrower, the combination, with a cylinder and actuating-piston, of a right-truck and a left-truck selector connected with said piston, and adapted to be operated respectively by the reverse movements of said piston; and power means and a controlling-valve for moving said piston in either direction.

7. In a locomotor switch-thrower, the combination, with a cylinder and actuating-piston, of a right-truck and a left-truck selector connected to be operated respectively by the reverse movements of said piston; power means and a controlling-valve for moving said piston in either direction; and retracting means for returning said piston to its neutral position.

8. In a locomotor switch-thrower, the combination, with a cylinder and actuating-piston, of a right-truck and a left-truck selector; means moving with said piston, and engaging said selector; and retracting means and stops for said selector.

9. In a locomotor switch-thrower, the combination, with a cylinder and actuating-piston, of a right-truck and a left-truck selector; a reversing-lever connected with one of said selectors; and stops movable with said piston, and engaging said reversing-lever and the other of said selectors.

10. In a locomotor switch-thrower, the combination, with a cylinder and actuating-piston, of two reverse-connected switch-throwing selectors operated by said piston; a retracting-spring and stop for each of said selectors; and power means and a controlling-valve for moving said piston in either direction, and releasing the same.

11. In a locomotor switch-thrower, the combination with right-truck and left-truck selectors, of actuating means for moving either of said selectors into operative position; a single cushionable two-way controlling-valve for the admission of air from the air-brake system to said actuating

means; exhaust connections from said actuating means, normally maintained open by said valve; and opposing yielding means tending to maintain said valve in its normal position.

12. In a locomotor switch-thrower, the combination with a locomotive having right-truck and left-truck selectors, of a piston and opposite conductors adapted to move either selector into operative position upon the admission of a motive agent to the appropriate conductor; an cushionable valve located convenient to the engineer or switchman, or both, and normally closing both of said conductors when in its neutral position; exhaust connections to said valve, in position and adapted to have either one covered thereby upon tipping the valve to open the trailing admission-conductor; yielding means tending to move said valve to its neutral position; and means for operating said valve in opposite directions at will.

13. In a locomotor switch-thrower, the combination with a car adapted to traverse a track, of an air-operated switch-thrower having right-truck and left-truck selectors; a reservoir containing air under pressure; admission connections from said reservoir to said switch-thrower; exhaust connections from said switch-thrower; and a controlling-valve normally closing said air connections and maintaining open the said exhaust connection.

14. In a device of the class specified, the combination with an automatic brake-controlled air-compressing means, of a tank connected with the delivery of said air-compressing means; air-operated right-truck and left-truck selectors; oppositely-operative pairs of admission and exhaust passages from said tank to and from said selector-operating device; and a controlling-valve governing said passages.

15. In a device of the class specified, the combination, with a car adapted to traverse a track, of an air-reservoir containing air above atmospheric pressure; an air-piston adapted to operate a left-truck switch-thrower when moved in one direction, and to operate a right-truck switch-thrower when moved in the reverse direction; and a controlling-valve for the admission of air from the reservoir to either side of said piston.

16. In a device of the class specified, the combination with a car adapted to traverse a track, of an air-reservoir containing air above atmospheric pressure; an air-piston adapted to operate a right-truck switch-thrower when moved in one direction, and to operate a left-truck switch-thrower when moved in the opposite direction; a controlling-valve governing the admission of air from said reservoir to either side of said piston, and the exhaust from said piston; and opposite selective foot-pedals operatively connected with said valve.

17. In a device of the class specified, the combination with a car adapted to traverse a track, of an air-tank, controlling-valve and double-acting air-piston; right-truck and left-truck selectors connected for operation by means of opposite movements of said piston respectively; and vertically-disposed wheels in said selectors, in position and adapted to depress switch-throwing means operatively connected with said track.

702,043. METERING-MACHINE. JOSEPH T. BKA, Cleveland, Ohio. Filed Nov. 22, 1901. Serial No. 23,200. (No model.)

Claim.—1. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, a guide-block pivoted to said table and adapted to move about its pivot into various operative positions, and means for locking said

guide-block in any desired position, the table, in the field over which said block is movable, being graduated with a series of rectangular coordinates of which the base-line (theoretical or actual) pass through the axis of the block.

2. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, a guide-block pivoted to said table and adapted to move about its pivot into various operative positions, and means for locking said guide-block in any desired position, the table, in the field over which said block is movable, being graduated with a series of rectangular coordinates of which the base-line (theoretical or actual) pass through the axis of the block, there being also, in the field over which said guide-block is movable, a graduated arc-shaped scale of which the axis of graduation registers with the guide-face of said block when the block lies at an angle of forty-five degrees to said plane.

3. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, a guide-block pivoted to said table and occupying normally a position in which its guide-face is at an angle of forty-five degrees to said plane, which block is movable from said position toward a position in which the guide-face is parallel to said plane, and means for locking said guide-block in any of its possible positions, the table, in the field over which said block is movable, being graduated with a series of equally-spaced parallel lines of which the base-line passes through the axis of the pivot of the block, and another series of intersecting lines which are parallel to and corresponding distances from a base-line (theoretical or actual) which passes through the axis of said pivot at right angles to said plane.

4. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, two guide-blocks pivoted to said table and independently movable into various positions relative to said plane, mechanisms for independently locking said guide-blocks in any of their several positions, there being on the table associated with one of said guide-blocks and in the field over which the block moves, a series of rectangular coordinates of which the base-line (theoretical or actual) pass through the axis of the pivot of the block, and an arc-shaped scale of which the axis of graduation is in a plane lying at an angle of forty-five degrees from the plane of the cutting-tool and said graduations extend therefrom toward a plane parallel with said plane of the tool, there being on the table also associated with the other guide-block and in the field over which it moves, a correspondingly-graduated arc-shaped scale whose axis of graduation is in a plane which lies at an angle of forty-five degrees to the plane of the tool and extends therefrom toward a plane lying at an angle of ninety degrees from the plane of the tool.

5. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, three guide-blocks pivoted to said table and independently movable upon their pivots into various operative positions, independent mechanisms for locking said guide-blocks in any desired position, there being upon the table associated with one of the guide-blocks and in the field over which it moves, a system of rectangular coordinates of which the base-line (theoretical or actual) pass through the axis of the pivot of the block, and an arc-shaped scale whose axis of graduation is in a plane lying at an angle of forty-five degrees to the plane of the tool and which extends therefrom toward a plane lying at ninety degrees to the plane of said tool, there being associated with the third block a correspondingly-graduated arc-shaped scale whose axis of graduation is in a plane lying at an angle of sixty-seven and one-half degrees to the plane of the tool and whose graduations extend in both directions from the axis.

6. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, three guide-blocks pivoted to said table and independently movable upon their pivots into various operative positions, independent mechanisms for locking said guide-blocks in any desired position, there being upon the table associated with one of the guide-blocks and in the field over which it moves a system of rectangular coordinates of which the base-line (theoretical or actual) passes through the axis of the pivot of the block, and an arc-shaped scale whose axis of graduation is in the plane lying at an angle of forty-five degrees to the plane of the tool and which extends therefrom toward a plane parallel to the plane of the tool, there being associated with one of the other blocks a correspondingly-graduated arc-shaped scale whose axis of graduation is in a plane lying at an angle of forty-five degrees to the plane of the tool and which extends therefrom toward a plane lying at ninety degrees to the plane of said tool, there being associated with the third block a correspondingly-

graduated arc-shaped scale whose axis of graduation is in a plane lying at an angle of sixty-seven and one-half degrees to the plane of the tool and whose graduations extend in both directions from the axis, there being also associated with this third block another correspondingly-graduated arc-shaped scale whose axis of graduation is in a plane lying at an angle of ninety degrees to the plane of the tool and which extends therefrom toward a plane parallel with the plane of the tool.

7. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, three guide-blocks pivoted to said table and independently movable upon their pivots into various operative positions, independent mechanisms for locking said guide-blocks in any desired position, there being upon the table, associated with one of the guide-blocks and in the field over which it moves, a system of rectangular coordinates of which the base-line (theoretical or actual) pass through the axis of the pivot of the block, and an arc-shaped scale whose axis of graduation is in the plane lying at an angle of forty-five degrees to the plane of the tool and which extends therefrom toward a plane parallel to the plane of the tool, there being associated with one of the other blocks a correspondingly-graduated arc-shaped scale whose axis of graduation is in a plane lying at an angle of ninety degrees to the plane of the tool and which extends therefrom toward the one-hundred-and-eighty-degree position.

8. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, and an adjustable guide-block pivoted thereon, there being in the field over which said block is movable four graduated arc-shaped scales, of which the axis of graduation of two of said scales is forty-five degrees removed in one direction from a plane at right angles to the plane of the tool, and the graduations on said two scales extend in opposite directions from said axis, while the axis of graduation of the other two arc-shaped scales is forty-five degrees removed in the opposite direction from a plane at right angles to the plane of the tool and the graduations thereon extend in the opposite direction from said axis.

9. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, an adjustable guide-block pivoted to said table, a shelf adjustably secured against the side of said guide-block, and a graduated scale on the table in the field over which said guide-block is movable.

10. The combination of a cutting-tool operating in a definite plane, with a work-supporting table relatively movable in a path parallel to said plane, an adjustable guide-block pivoted to said table, two work-supporting shelves adjustably secured to opposite vertical faces of said guide-block, and graduated scales on said table for cooperation with said guide-block.

702,044. COPING-MACHINE. JAMES T. REA, Cleveland, Ohio.
Filed Dec. 2, 1901. Serial No. 95,137. (No model.)

Claim.—1. In a coping-machine, the combination of a table having in its work-supporting surface a guide-groove, a slide movable in said guide-groove, a cope-chisel secured to said slide, an adjustable gage also secured to the slide, an adjustable guide-block secured to the table, and mechanism for operating said slide, substantially as specified.

2. In a coping-machine, the combination of a table having an undercut groove in its work-supporting surface, a slide mounted in said groove, a bar secured to said slide and having on one edge, rock-teeth which lie beneath one overhanging edge of the groove in the table, a plane engaging with said teeth, mechanism for turning said plane, a cope-chisel secured to said slide, and a guide-block adjustably secured to the top of the table, substantially as specified.

3. In a coping-machine, the combination of a table having a guide-groove in its work-supporting face, a slide mounted in said groove and carrying a tool-carrier which has an outwardly-projecting grooved shelf on its side, a clamping-plate secured to said tool-carrier and having a groove in the under side of its overhanging edge, a cope-chisel having dovetailed flanges for engagement with the groove in said shelf and clamping-plate, and mechanism for operating said slide, substantially as specified.

4. In a coping-machine, the combination of a table having a guide-groove in its work-supporting face, a slide mounted therein having an inclined top face, a tool-carrier having a beveled lower face which rests upon the beveled face on the slide, and laterally-extended shelf having a groove in its top surface, a set-screw for fastening the tool-carrier to the slide, a clamping-plate secured to the top of the tool-carrier and having a groove in the under side of its overhanging edge, and a cope-chisel having dovetailed flanges for engagement with said groove, substantially as specified.

5. In a coping-machine, the combination of a table having a guide-groove in its work-supporting face, a slide mounted in said guide-groove, a tool-carrier upon said slide having a laterally-projecting longitudinally-grooved shelf, a clamping-plate secured to said tool-carrier and having a groove in its overhanging edge, a cope-chisel having dovetailed flanges for engagement with said groove, a gage-spring secured to the sliding member, and a set-screw in the clamping-plate engaging with said spring to adjust it into various positions, substantially as specified.

6. In a coping-machine, the combination of a table having a guide-groove in its work-supporting face, a slide movable therein, mechanism for operating it, a tool-carrier upon said slide having on its side longitudinally-extended shelves, a clamping-plate secured upon said tool-carrier and overhanging the same at both edges and having two rearwardly-projecting talloons, cope-chisels clamped between said clamping-plate and shelves, two gage-springs secured to opposite sides of the clamping-plate, two set-screws serving through said talloons and engaging with said gage-springs, and a plurality of adjustable guide-blocks secured in the face of the table on opposite sides of the guide-groove therein, substantially as specified.

7. In a coping-machine, the combination of a work-supporting table, a tool-carrier movable in a guideway upon said table, an adjustable gage secured to and movable with the tool-carrier, an adjustable guide-block upon the table, and mechanism for operating said tool-carrier, substantially as specified.

702,045. TICKET-HOLDER. ALONZO S. ADAMS, Boston, Mass.
Filed July 11, 1901. Serial No. 97,094. (No model.)

Claim.—1. In a ticket-holder, a blade having a guide, and independent spring-tegans integral with the blade extending along the medial line toward the center of the blade, combined with a strip fastened in contact with the blade at its ends but having its central portion clear of the blade, and projectors from the blade to form with the strip clamps to hold a ticket at points distant from each other to prevent the ticket twisting or slipping, substantially as described.

2. In a ticket-holder, a strip and a blade arranged to form a ticket-receiving opening between them, combined with a yielding projection to clamp the body of the ticket to the strip and means formed by the junction of the strip and blade to clamp along the edge of the ticket, substantially as described.

702,046. MACHINE FOR THE PRODUCTION OF FOLDED JOINTS OF SHEET METAL. THEO. L. GARDNER, Berlin, Germany. Filed July 14, 1900. Serial No. 98,116. (No model.)

Claim.—1. In a machine for the manufacture of sheet-metal cans and analogous cylindrical articles of sheet metal, the "former" 3 of a little less diameter, supported by the framing of the machine at one end only, grooves 4 and 5 at the supported end of each former, adapted to receive the sheet metal with its edges in each groove and to so present it as to loosely embrace the former, feeding and guiding rolls arranged to seize and move forward the sheet metal, and folding-rolls arranged to act in pairs on the overlapped edges and induce coinciding partial folds thereof while in the overlapped position, all combined and arranged to serve substantially as herein specified.

2. In a machine for the production of folded joints for sheet-metal cans, the combination with a lower set of guiding and bending rollers arranged within a "former" 3 of an upper set of rollers, means for independently rotating each set and means for strongly and yieldingly pressing them together, substantially as herein specified.

3. In a machine for the manufacture of sheet-metal cans and analogous cylindrical articles of sheet metal, having the "former" 3 of somewhat smaller diameter than the body of the machine at one end only, and grooves 4 and 5 at the supported end of the former, rolls arranged to seize and move forward the sheet metal as presented as to loosely embrace the former with its edges in each groove, the first pair 7, 8, of each roll flanged and arranged reversely to serve the double function of feeding-rollers and as guides for the entering sheet metal, and folding-rolls arranged to act in pairs on the overlapped edges, all combined and arranged to serve substantially as herein specified.

4. In a machine for the manufacture of sheet-metal cans and analogous cylindrical articles of sheet metal, having the "former" 3 of somewhat smaller diameter than the body of the machine at one end only, and grooves 4 and 5 at the supported end of the former, rolls arranged to seize and move forward the sheet metal as presented as to loosely embrace the former with its edges in each groove, the first pair 7, 8, of each roll flanged and arranged reversely to serve the double function of feeding-rollers and as guides for the entering sheet metal, and folding-rolls arranged to act in pairs on the overlapped edges, one member of each pair of rollers being mounted within the former and a pin-chain and impelling means therefor driven from the obtained end of the former and engaging with gear-wheels on the several rollers within the former, all combined and arranged to serve substantially as herein specified.

5. In a machine for the production of folded joints for sheet-metal cans, the combination with a grooved "former" serving as guiding means, of a pair of revolving folding-rollers adapted to simultaneously bend both parts of the superposed metal into a grooved and rigid form, means for revolving said rollers and means for bending over the ridged portions of both the overlapped parts of the metal and causing them to lie against the body of the can, substantially as described.

6. In a machine for the production of folded joints for sheet-metal cans, the combination with guiding-grooves 4 and 5, and feeding means the rolls 7 and 8, of a revolving roller having a groove 12, and a roller having a matching ridge or collar 14, of a stationary die 15 with a suitably-formed groove 19, firmly held in the path of such coinciding bent portions of the metal, adapted to bend such portions over and cause them to lie against the body of the can and means for strongly actuating such rollers so as to carry the partially-formed fold reliably through the die, all substantially as described.

7. In a machine for the production of folded joints for sheet-metal cans, the combination with guiding-grooves 4 and 5 and feeding means the rolls 7 and 8, of a revolving roller having a groove 12, and a roller having a matching ridge or collar 14, of a stationary die 15 with a suitably-formed groove 19, firmly held in the path of such coinciding bent portions of the metal, adapted to bend such portions over and cause them to lie against the body of the can, and means for strongly actuating such rollers so as to carry the partially-formed fold reliably through the die, and a pair of rollers 16, 16, and means for revolving the same arranged to act on the seam after its passage through such die and press the joint flat, all substantially as described.

8. In a machine for the production of folded joints for sheet-metal cans, having revolving feeding and guiding rollers 7 and 8, and a "former" 3 with the grooves 4, 5, in the final part, the combination therewith of revolving feeding-rollers adapted to bend the unprepared metal into coinciding grooved forms, the slide 6 carrying the bearings of the rollers 12, 14, and the weighted lever 20 pressing down such rollers, a slide 6 movable up and down in the first-named slide, carrying the bearings of the uppermost member 7 of a pair of guiding-rollers 7, 8, and a weighted lever 20 pressing on such slide, proportioned as shown so as to induce a stronger hold by the guiding than by the grooving rollers, all arranged for joint operation substantially as herein specified.

9. In a machine for the production of folded joints for sheet-metal cans, having the former 3 and grooves 4 and 5, revolving guiding and grooving rollers, a die 15 having a groove 19 for folding the coinciding grooved overlapping metal down into contact with the body of the can, and rollers 16, 16, for pressing such flat, the combination therewith of a tank with means for keeping solder melted therein, a soldering-iron, and means for moving the sheet metal slowly past these appliances, all substantially as herein specified.

10. In a machine for the production of folded joints for sheet-metal cans, having the former 3 and grooves 4 and 5, revolving guiding and grooving rollers, a die 15 having a groove 19 for folding the coinciding grooved overlapping metal down into contact with the body of the can, and rollers 16, 16, for pressing such flat, the combination therewith of a tank 20, and provisions for keeping solder melted therein, a soldering-iron, and means for moving the sheet metal slowly past these appliances, and means for warming the surfaces immediately before the presentation of the solder thereto, all substantially as herein set forth.

702,047. PROCESS OF REMOVING METALLIC SULFIDE SOLUBLE. GILLES S. COLLIER, Washburn, N. Y., assignor to Calvin Amory Stevens, New York, N. Y. Filed Aug. 22, 1901. Serial No. 73,222. (No specimen.)

Claim.—1. The process herein set forth of rendering metallic sulfide soluble, consisting in dissolving the crushed solid ore with aqueous ammonia, draining off the excess of aqueous ammonia, and exposing the ore then moistened to the action of an excess of oxygen, whereby the oxygen is brought into intimate contact with the moist particles of crushed ore and the chemical action is continued, substantially as set forth.

2. The process herein set forth of rendering metallic sulfide soluble, consisting in dissolving the crushed solid ore with aqueous ammonia, draining off the excess of aqueous ammonia, and exposing the ore then moistened to the atmosphere, whereby the crushed ore and the ammonia absorbed and held thereby, are treated to an excess of oxygen, for the purpose of accelerating chemical action, substantially as set forth.

3. The process herein set forth of rendering metallic sulfide soluble, consisting in dissolving the crushed solid ore with aqueous ammonia, draining off the excess of aqueous ammonia, treating the ore then moistened to an excess of oxygen, leaching the ore, and repeating the operation until the metal is all extracted from the pulp, substantially as set forth.

702,048. TELESCOPE. ANDREW A. CANNON, Belling, England. Filed May 11, 1901. Serial No. 20,717. (No model.)

Claim.—In a telescope, the combination of a main tube, an objective lens fixed at one end of said tube, an eyepiece fitted to turn without moving longitudinally in the opposite end of said tube, an ocular, a carrier consisting of a cylinder in which the ocular is fixedly secured and which is fitted within the main tube and slotted longitudinally, a further secured

within the main tube and carrying the longitudinal slot in the carrier, a tube connected with the eyepiece to turn therewith without moving longitudinally relatively thereto and having on its exterior a spirally-grooved cylinder which is fitted to turn within the carrier, and a piece projecting from and within the carrier and entering the spiral groove of the latter cylinder, all substantially as and for the purpose herein described.

702,049. FIRST-STARTER OR GAS-HEATER. THOMAS B. DRAPER, San Francisco, and GEORGE T. LEON, West Oakland, Cal. Filed July 25, 1901. Serial No. 62,604. (No model.)

Claim.—1. In a device of the character described, the combination with the grate of the fire-box of a coal-stove, of a gas-pipe fixedly secured immediately below the grate, said gas-pipe being closed at one end, and connected at the other end with a pipe from the source of supply, said pipe having an orifice near the closed end, said orifice discharging upwardly into said grate, and a shield or cover removably covering said orifice, substantially as described.

2. In a device of the character described, the combination with the grate of the fire-box of a coal-stove, of a gas-pipe fixedly secured immediately below the grate, said gas-pipe being closed at one end, and connected at the other end with a pipe from the source of supply, said pipe having an orifice near the closed end, said orifice discharging upwardly into said grate, and means for removably covering said orifice from above and for spreading the flame, substantially as described.

3. In a device of the character described, the combination with the grate of the fire-box of a coal-stove, of a gas-pipe fixedly secured immediately below the grate, said gas-pipe being closed at one end, and connected at the other end with a pipe from the source of supply, said pipe having an orifice near the closed end, said orifice discharging upwardly into said grate, and a shield or cover removably covering said orifice and suitably constructed on its under surface to deflect and discharge the gas issuing from said orifice when so covered, substantially as described.

4. In a device of the character described, the combination with the grate of a fire-box of a coal-stove, of a gas-pipe leading beneath the fire-

box and fixedly secured thereunder, and having an orifice, and a sleeve sliding on the pipe to cover the gas-orifice, the inner surface of said sleeve being suitably constructed to deflect and discharge the gas issuing from said orifice when the latter is surrounded by the sleeve, substantially as described.

5. In a device of the character described, the combination with the grate of a fire-box of a coal-stove, of a gas-pipe leading beneath the fire-box and fixedly secured thereunder, and having an orifice discharging upwardly beneath said fire-box, a sleeve sliding on the pipe to cover the gas-orifice, said sleeve having a flaring groove in its inner surface arranged to register with the orifice and distribute the gas issuing from said orifice, said sleeve having flanges a long to extend from the outer surface thereof, the position of which indicates the position of said orifice, substantially as described.

702,050. METHOD OF REMOVING SCALE OXIDE FROM THE SURFACE OF IRON OR STEEL. ARTHUR E. HANCOCK, Brooklyn, N. Y. Filed Sept. 26, 1900. Serial No. 20,547. (No specimen.)

Claim.—1. The method herein described of removing hammer-scale from iron or steel, which consists in treating the same with an agent to reduce the more insoluble oxide of the scale to a soluble condition, and with a solvent for the resulting acid which does not injuriously attack the underlying metal, as set forth.

2. The method herein described of removing hammer-scale from iron or steel, which consists in immersing the same in a bath containing a reducing agent for the higher oxide, and sodium bisulfite, as set forth.

3. The method herein described of removing hammer-scale from iron or steel, which consists in treating the same with a bath containing in solution ammonium sulfite and sodium bisulfite, as set forth.

4. The method herein described of removing hammer-scale from iron or steel, which consists in treating the same with a bath containing in solution ammonium sulfite and sodium bisulfite, as set forth.

702,051. FILTERING-SCREEN. KARL REINHER, Worms, Germany, assignor to Filter, Industrietechnische Maschinen-Fabrik, Akt. Ges. vorm. L. A. Reuther, Worms, Germany. Filed July 2, 1901. Serial No. 62,522. (No model.)

Claim.—1. Grid for filtering-press, comprising a central grating and an outer frame having apertures, which when the press is assembled constitute the liquid inlet and outlet conduits, said frame being formed with a lateral rim surrounding the apertures, which rim at two diagonally opposite apertures is removed in order to form a passage to connect the interior of the grating with the inlet and outlet conduits, substantially as described.

2. Grid for filtering-press comprising a central grating and an outer frame having inclined approximately pear-shaped apertures, which when the press is assembled constitute the liquid inlet and outlet conduits, said frame being formed with a lateral rim surrounding the apertures, which rim at two diagonally opposite apertures is removed in order to form a passage to connect the interior of the grating with the inlet and outlet conduits, substantially as described.

702,052. ADDRESS-MACHINE. ROBERT FINE, Astoria, N. Y., assignor to the United Typewriter Company, Jersey City, N. J., a Corporation of New Jersey. Filed Dec. 22, 1900. Serial No. 62,612. (No model.)

Claim.—1. The combination of type mechanism, a carriage, an adding or registering mechanism, a second carriage on which the adding- or registering mechanism is mounted, and means for automatically connecting said carriages together at a predetermined point in the forward traverse of the

type-writer carriage, means independent of the moving means of the first-named carriage for moving the carriage on which the adding- or registering mechanism is mounted; substantially as described.

2. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, and independent spring-operated driving mechanism for said second carriage and automatically thrown or brought into operation when the type-writer carriage reaches a predetermined point in its forward traverse; substantially as described.

3. The combination of type mechanism, a carriage, an adding mechanism, one part of which has motion to and fro relatively to the other part, and an independent driving mechanism for moving said movable part and normally out of action until the said carriage reaches a predetermined point in its forward motion; substantially as described.

4. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, mechanism for connecting said carriages together when the type-writer carriage reaches a predetermined point in its forward traverse, and an independent spring for moving said second carriage but normally inactive before the type-writer carriage reaches said point and thrown into operation when said carriages are coupled together, substantially as described.

5. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, gearing continuously connected with one of said carriages and discontinuously connected with the other thereof, and a drive-spring connected with said gearing and on a center until the gearing is connected with both carriages, substantially as described.

6. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, an independent driving mechanism for said second carriage, and means for automatically connecting said driving mechanism with the type-writer carriage when the latter reaches a predetermined point in its forward traverse; substantially as described.

7. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, an independent driving mechanism for said second carriage and normally inactive during a part of the forward traverse of the type-writer carriage, and means for automatically throwing or bringing said driving mechanism into action when the type-writer carriage reaches a predetermined point in said forward traverse; substantially as described.

8. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which the adding- or registering mechanism is mounted, an independent driving mechanism for said second carriage, and means for automatically connecting said driving mechanism with said type-writer carriage at a predetermined point in the forward traverse of the latter; substantially as described.

9. The combination of type mechanism, a carriage, an adding or registering mechanism including a series of adding- or registering wheels, a second carriage on which the adding- or registering wheels are mounted, normally inactive independent driving mechanism for said adding- or registering mechanism; and

means for automatically throwing said driving mechanism into action when the type-writer carriage reaches a given point in its forward traverse; substantially as described.

10. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, a rack on the last-named carriage, a pinion meshing with said rack, a spring for rotating said pinion in one direction, and means for rendering said spring inoperative during a part and operative during the remainder of the forward traverse of the type-writer carriage; substantially as described.

11. The combination of type mechanism, a carriage, an adding or registering mechanism, a second carriage supporting the adding-wheel, a rack on said second carriage, a pinion meshing with said rack, and mechanism for automatically connecting said pinion with the type-writer carriage at a predetermined point in the forward motion thereof; substantially as described.

12. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which the adding-wheel is mounted, a rack on said second carriage, a pinion meshing with said rack, and a short rack connected with the type-writer carriage and adapted to move into and out of mesh with said pinion at a given point in the path of said type-writer carriage, and connections between said shaft and said adding-mechanism carriage for moving the latter to and fro; substantially as described.

13. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which the adding-wheel is mounted, a rack on said second carriage, a pinion meshing with said rack, and a short rack connected with the type-writer carriage and adapted to move into and out of mesh with the second pinion of said shaft at a given point in the path of the said type-writer carriage; substantially as described.

14. The combination of type mechanism, a carriage, an adding mechanism including a series of adding-wheels, a second carriage on which the adding-wheels are mounted, a short rack connected with the type-writer carriage, a pinion meshing with said rack, and a short rack connected with the type-writer carriage and adapted to move into and out of mesh with the second pinion of said shaft at a given point in the path of the said type-writer carriage; substantially as described.

15. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, a rack on said adding-mechanism carriage, a pinion meshing with said rack, a spring connected with said pinion and on a center during part of the forward traverse of the type-writer carriage, and means for moving said spring-driven mechanism off the center when the type-writer carriage reaches a predetermined point in its forward traverse; substantially as described.

16. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, a rack on said adding-mechanism carriage, a pinion meshing with said rack, a spring connected with said pinion and on a center during part of the forward traverse of the type-writer carriage, and means for moving said spring-driven mechanism off the center when the type-writer carriage reaches a predetermined point in its forward traverse; substantially as described.

17. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, a rack on said adding-mechanism carriage, a pinion meshing with said rack, a spring connected with said pinion and on a center during part of the forward traverse of the type-writer carriage, and means for moving said spring-driven mechanism off the center when the type-writer carriage reaches a predetermined point in its forward traverse; substantially as described.

18. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which the adding-wheel is mounted, a rack on the last-named carriage, a pinion engaging with said rack, a spring for rotating said pinion in one direction, mechanism for automatically connecting the type-writer carriage and said pinion at a given point in the path of the type-writer carriage, and means for holding said pinion against rotation prior to such automatically-made connection; substantially as described.

19. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which the adding-wheel is mounted, a rack on the last-named carriage, a pinion engaging with said rack, a spring for rotating said pinion in one direction, mechanism for automatically connecting the type-writer carriage and said pinion at a given point in the path of the type-writer carriage, and means for holding said pinion against rotation prior to such automatically-made connection; substantially as described.

20. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, a rack on the last-named carriage, a pinion engaging with said rack, a spring for rotating said pinion in one direction, a short rack connected with the type-writer carriage and meshing with the second pinion upon said shaft at a predetermined point in the forward traverse of the type-writer carriage, and

means for preventing rotation of said shaft before such predetermined point is reached; substantially as described.

21. The combination of type mechanism, a carriage, and adding mechanism, a second carriage on which part of said adding mechanism is mounted, a rack on the last-named carriage, a pinion meshing with said rack, a short rack on the last-named carriage, a pinion meshing with said rack, a short rack connected with the type-writer carriage for meshing with said second pinion at a given point in the forward traverse of the type-writer carriage, a flat-faced block connected with said shaft, a bar connected with the type-writer carriage and engaging with a flat or plane face of said block for preventing rotation of said shaft prior to such given point, and a spring connected to said shaft concentrically thereto and "on a center" while the shaft is locked against rotation as above; substantially as described.

22. The combination of a type-writer carriage, a bar 111 connected therewith, a rack 112 on said bar 111, an endwise-movable journal shaft, a pinion 109 on said shaft, a plate 114 connected with bar 111, and ending at 115, a flat-faced block 110 on said shaft, the plane of flat part of the said block and the bar 111 engaging to lock said shaft against motion, and the locking part of said bar 111 ending as at 113 to permit the rotation of said shaft, an adding-mechanism carriage, and connections between said shaft and said adding-mechanism carriage for moving the latter; substantially as described.

23. The combination of type mechanism, a carriage, an adding mechanism, an independent carriage on which the adding-wheel is mounted, and a shaft journaled in the framework of the machine and continuously geared with said adding-mechanism carriage and discontinuously geared with the type-writer carriage, whereby the type-writer carriage may move through part of its forward traverse while the adding-mechanism carriage remains stationary and the two carriages are connected together at a predetermined time or point and the motion of the adding-mechanism carriage is governed by that of the type-writer carriage; substantially as described.

24. The combination of type mechanism, a carriage, an adding mechanism, a second carriage on which part of the adding mechanism is mounted, a short rack connected with the type-writer carriage, a pinion meshing with said rack, and a pinion meshing with said rack and adapted to move into and out of mesh with the second pinion of said shaft at a given point in the path of the said type-writer carriage; substantially as described.

25. The combination of type mechanism, a carriage, a short rack connected with said carriage, a rotary pinion movable into and out of the path of said rack, an adding mechanism, a second carriage for carrying part of said adding mechanism, and continuously-operative connections between said second carriage and said pinion whereby the said carriages are automatically connected together at a given point in the forward traverse of the type-writer carriage whenever said pinion is in one position, and are not connected when said pinion is in another position; substantially as described.

26. The combination of type mechanism, a carriage, a short rack connected with said carriage, a rotary pinion movable into and out of the path of said rack, an adding mechanism, a second carriage for carrying part of said adding mechanism, and continuously-operative connections between said second carriage and said pinion whereby the said carriages are automatically connected together at a given point in the forward traverse of the type-writer carriage whenever said pinion is in one position, and are not connected when said pinion is in another position; substantially as described.

27. The combination of type mechanism, a carriage, a short rack connected with said carriage, a rotary pinion movable into and out of the path of said rack, an adding mechanism, a second carriage for carrying part of said adding mechanism, and continuously-operative connections between said second carriage and said pinion whereby the said carriages are automatically connected together at a given point in the forward traverse of the type-writer carriage whenever said pinion is in one position, and are not connected when said pinion is in another position; substantially as described.

28. The combination of type mechanism, a carriage, a short rack connected with said carriage, an endwise-movable journal shaft provided with a pinion for meshing with said rack in one endwise position of said shaft, a lever for moving said shaft endwise, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, and connections between said second carriage and said endwise-movable shaft whereby the shaft moves said second carriage to and fro; substantially as described.

29. The combination of a type-writer carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted,

ed, an endwise-movable rotary shaft, a short rack connected with the type-writer carriage, a pinion on said shaft and moved thereby into and out of position for meshing with said rack, connections between said shaft and the adding-mechanism carriage, and a drive-spring for the said shaft connected therewith "on a center" at such time as said rack moves out of mesh with the said pinion; substantially as described.

30. The combination of type mechanism, a carriage, adding mechanism, a second carriage on which part of said adding mechanism is mounted, a journal shaft continuously geared with one and discontinuously geared with the other of said carriages, a spring connected with said shaft for rotating it in one direction but normally inactive until the shaft is geared with both carriages, and means for preventing rotation of said shaft until said shaft is geared with both carriages; substantially as described.

31. The combination of a type-writer carriage, an adding mechanism, a second carriage on which part of said adding mechanism is mounted, an endwise-movable shaft, a short rack connected with the type-writer carriage, a pinion on said shaft moved thereby into and out of position for meshing with said rack, connections between said shaft and the adding-mechanism carriage, and a drive-spring for the said shaft connected therewith "on a center" at such time as said rack moves out of mesh with said pinion, with means for locking said shaft against rotation when said pinion is in the path of said rack and during a part of the traverse of the type-writer carriage; substantially as described.

32. The combination of a series of letter and figure types and keys thereof, a carriage, adding-wheel, independent means for rotating each wheel, a spring-driven rotary driver for operating said rotating means one at a time, an independent carriage for either the said rotating means or the said driver and moving at a rate of speed different from that of the carriage first named, and a common component, operated by any of the figure-keys for controlling the rotary motion of said driver, substantially as set forth.

33. The combination of type mechanism, a carriage, a second carriage moving at a rate of speed different from that of the first carriage, adding-wheel mounted upon the second carriage and provided with independently-operable relative means, a common driver adapted to operate said relative means and their associated adding-wheels one by one as they are moved along upon said second carriage, a spring for rotating said common driver progressively in one direction, and a variable-throw component mechanism controlled from the keyboard of the type mechanism for controlling the rotary motion of said driver; substantially as described.

34. The combination of type mechanism, having a keyboard, a carriage, adding-wheel, a second carriage on which said wheels are mounted, a rotary spring-driven driver for operating said adding-wheels as the carriage therefor moves the same in the direction of the axis of said driver, and a variable-throw component mechanism controlled from the keyboard for controlling said driver; substantially as described.

35. The combination of type mechanism, a carriage, adding-wheel, a spring-driven rotary driver for operating said adding-wheel, a second carriage on which two of said driving and adding elements is mounted and by which it is moved relatively to the other, a key-operated component mechanism for controlling said driver and spring, and said driver being normally out of operative relation with the adding-wheel during a part of the forward traverse of the type-writer carriage, and means for connecting or gearing said carriages together during a part of the forward traverse of the type-writer carriage; substantially as described.

36. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said adding-wheel is mounted, a spring-driven rotary driver out of operative relation with said wheel during a part of the forward motion of the type-writer carriage, a key-operated component for controlling the rotary motion of said driver, and means for discontinuously gearing said carriages together, whereby the type-writer carriage may progress to a predetermined point before said carriages are coupled together and said driver is brought into operative relation with said wheel; substantially as described.

37. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven mechanism for operating said wheel and disengaged therefrom during a part of the forward traverse of said first-named carriage, component mechanism for controlling said driving mechanism, and connections between the type mechanism and said component mechanism for operating the latter; substantially as described.

38. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven mechanism for operating said wheel and disengaged therefrom during a part of the forward traverse of said first-named carriage, component mechanism for controlling said driving mechanism, and connections between the type mechanism and said component mechanism for operating the latter, with driving mechanism for said second carriage, inactive until the first-

named carriage reaches a given point in its forward traverse; substantially as described.

39. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven mechanism for operating said wheel and disengaged therefrom during a part of the forward traverse of said first-named carriage, component mechanism for controlling said driving mechanism, and connections between the type mechanism and said component mechanism for operating the latter, with spring-driven mechanism for moving said second carriage but inactive until the first-named carriage reaches a predetermined point in its forward traverse; substantially as described.

40. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven mechanism for operating said wheel and disengaged therefrom during a part of the forward traverse of said first-named carriage, component mechanism for controlling said driving mechanism, and connections between the type mechanism and said component mechanism for operating the latter, with gearing continuously connected with one and discontinuously connected with the other of said carriages; substantially as described.

41. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven mechanism for operating said wheel and disengaged therefrom during a part of the forward traverse of said first-named carriage, component mechanism for controlling said driving mechanism, and connections between the type mechanism and said component mechanism for operating the latter, with gearing continuously connected with one and discontinuously connected with the other of said carriages, and a spring connected to said gearing for operating the same but inactive until the gearing is connected with both carriages; substantially as described.

42. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven mechanism for operating said wheel and disengaged therefrom during a part of the forward traverse of said first-named carriage, an component-wheel connected to and controlling said driving mechanism, a detent for said wheel, a reciprocating feed-rack or ratchet-bar movable transversely into and out of mesh with said wheel and spring-pressed in one direction of its reciprocation, a series of stops adapted to arrest said bar in different positions, and connections with type mechanism for operating said stops, detent and bar; substantially as described.

43. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, an component-controlled driver adapted to operate the adding-wheel one by one as they are moved along, a spring for rotating said driver in one direction, and means connected with the first-named carriage for setting said spring, during the return movement of said first-named carriage; substantially as described.

44. The combination of type mechanism, a carriage, adding-wheel, a second carriage on which said wheel is mounted, a spring-driven driver for operating said adding mechanism, a variable-throw component mechanism controlled from the keyboard of the type mechanism for controlling said driver, and means connected with the first-named carriage for setting the spring operating said driver; substantially as described.

45. The combination of type mechanism having a keyboard, a carriage, adding-wheel supported upon another carriage, a spring-driven rotary driver for operating said adding-wheel one by one but out of operative relation thereto during a part of the forward traverse of the first-named carriage, means for coupling said carriages together at a given point in said forward traverse and causing the adding-mechanism carriage to move step by step with the first-named carriage, a variable-throw component mechanism controlled from the keyboard for controlling said driver, and means connected with the first-named carriage for setting said driver-operating spring; substantially as described.

46. The combination of type mechanism, a carriage, adding-wheel, a spring-driven rotary driver for said wheel, said driver and said adding-wheel being relatively movable, a second carriage upon which said movable element is mounted, a key-controlled variable-throw component for controlling the rotation of said driver, and means connected with said first-named carriage for setting the said driver-operating spring; substantially as described.

47. The combination of adding-wheel having independent driving means for the wheel, a driver for operating said adding-wheel, said driver and said adding-wheel being relatively movable, a carriage upon which said movable element is mounted, a spring for rotating said driver, type mechanism, a second carriage, mechanism connected with said second carriage for setting said spring, and an component controlling the rotation of said driver and operated from the keyboard of the type-operating mechanism; substantially as described.

48. The combination of type mechanism, a carriage, adding-wheel, independent operating mechanisms for the wheel, a spring-driven rotary driver for operating said wheel one by one, said driver and said add-

ing-wheel being relatively movable and a second carriage upon which said movable element is mounted, an component controlled by the type-operating mechanism for controlling the rotation of said driver, and means connected with said first-named carriage for setting the said driver-operating spring; substantially as described.

48. The combination of adding-wheel, independent operating means for the wheel, a rotatory spring-driven driver for operating said means one at a time, and said driver and said adding-wheel and means being relatively movable, a type-writer carriage, a sheave or pulley journaled on and connected to said carriage by a spring, a cord fast to said pulley and connected to set the driver-operating spring as the type-writing carriage is moved in one direction, and an component controlled from the type-operating mechanism of the type-writer for controlling the rotation of said driver; substantially as described.

50. The combination of type mechanism, a carriage, adding-wheel, independent operating means for the wheel, a driver for operating said means one at a time, said driver and said adding-wheel being relatively movable, and being disengaged one from the other during a part of the traverse of the said carriage, a shaft with which said driver is connected, a barrel loose on said shaft, a locking-ratchet connecting said barrel and said shaft, a cord connected with said barrel for rotating it in one direction and connected with a spring, a second cord connected with said barrel for rotating it in the opposite direction, said second cord also being connected with said carriage, and an component operated from the keyboard of the type mechanism for controlling the rotation of said driver; substantially as described.

51. The combination of type mechanism, a carriage, adding-wheel, independently-operable driving means for said wheel, a single driver for operating said driving means one at a time and disengaged therefrom during a part of the traverse of the said carriage, a spring and connections for operating said driver, an component controlled from the type-operating mechanism for controlling the rotation of said driver, means connected with the said carriage for setting said driver-operating spring, and means for causing engagement between said driver and said driving mechanisms of the adding mechanism one at a time after the said carriage has reached a given point in its forward traverse; substantially as described.

52. The combination of type mechanism, a carriage, adding-wheel, independent operating means for said wheel, a spring-driven driver for operating said independent means one at a time and disengaged therefrom during a part of the traverse of the said carriage, said driver and adding-wheel and operating means being relatively movable, means for causing said driver and said adding-wheel and operating means to move relatively after the said carriage has reached a given point in its forward traverse, an component operatively connected with the type-operating mechanism for controlling the rotation of said driver, and means for locking said driver against rotation at will; substantially as described.

53. The combination of a power-driven component-wheel, a movable holding-dog coacting therewith, and an endwise-movable rack or ratchet bar movable transversely of its length into and out of mesh with said wheel and constructed to coöperate with the holding-dog to permit the escape movements of the wheel; substantially as described.

54. The combination of a power-driven component-wheel, a movable detent coacting therewith, an endwise-movable rack or ratchet bar movable transversely of its length into and out of mesh with said component-wheel and constructed to coöperate with the holding-dog to permit the escape movements of the wheel, and means for arresting said rack or ratchet bar in its endwise motion at different distances from its initial position; substantially as described.

55. The combination of a power-driven component-wheel, a pivoted holding-dog coacting therewith, an independently-pivoted carrier, an endwise-movable rack or ratchet bar on said carrier adapted to coact with said holding-dog and said component-wheel, and a driver controlled by said component-wheel; substantially as described.

56. The combination of an component-wheel, a movable holding-dog coacting with said wheel, a rack or ratchet bar for coaction with said component-wheel, a movable carrier on which said bar is mounted to move endwise to and fro, independently-movable steps for arresting said rack or ratchet bar at different distances from its initial position, and a driver controlled by said component-wheel; substantially as described.

57. The combination of an component-wheel, a spring-pressed holding-dog coacting therewith, an endwise-movable rack or ratchet bar movable transversely into and out of mesh with said wheel, independently-movable steps for arresting said bar at different distances from its initial position, connections between said steps and said holding-dog whereby each step moves the dog to release the wheel, and a driver controlled by said component-wheel; substantially as described.

58. The combination of an component-wheel, a spring-pressed pivoted holding-dog for coaction with said wheel, a pivoted carrier, a rack or ratchet bar movable endwise to and fro on said carrier and adapted to mesh with said wheel, independently-movable steps for arresting said bar

at different distances from its initial position, means operated by each of said steps for disengaging said dog from the wheel, and a driver controlled by said component-wheel, substantially as described.

59. The combination of an component-wheel, a movable holding-dog, therefor, an endwise-movable rack or ratchet bar for coaction with said wheel and movable transversely into and out of mesh therewith, independently-movable steps arranged in line oblique to said bar and adapted to arrest the same at different distances from the initial position thereof, and a driver controlled by said component-wheel, substantially as described.

60. The combination of an component-wheel, a movable holding-dog, therefor, an endwise-movable rack or ratchet bar movable transversely into and out of mesh with said wheel, independently-movable steps arranged in a line oblique to said bar and adapted to stop the said bar at different distances from its initial position, connections whereby each step operates said holding-dog, and a driver controlled by said component-wheel, substantially as described.

61. The combination of an component-wheel, a movable holding-dog coacting therewith, a movable carrier, a rack or ratchet bar movable endwise to and fro on said carrier and moved into and out of mesh with said wheel by said carrier, independently-movable steps arranged in line oblique to the direction of reciprocation of said bar and adapted to arrest the said bar at different distances from its initial position, connections whereby each step operates said movable dog, and a driver connected with and controlled by said component-wheel; substantially as described.

62. The combination of an component-wheel, a spring-pressed holding-dog coacting with said wheel, an endwise-movable rack or ratchet bar movable transversely into and out of mesh with said wheel, independently-movable steps arranged in line oblique to the line of reciprocation of said bar and adapted to arrest said bar at different distances from its initial position, means intermediate said steps and said dog whereby each step disengages the dog from the said wheel, and a driver connected with and controlled by said component-wheel, substantially as described.

63. The combination of an component-wheel, a holding-dog, a frame provided with two rack or ratchet bars for coaction with said component-wheel, said frame being movable transversely thereof and also movable to and fro in the direction of said bars, independently-movable steps arranged in line across said frame and adapted to coact therewith to arrest the frame at different distances from the initial position thereof, and a driver connected with and controlled by said component-wheel; substantially as described.

64. The combination of an component-wheel, a holding-dog, a rectangular frame provided with two rack-bars for coaction with said wheel and movable into and out of mesh therewith, said frame being movable to and fro in the direction of said bars, independently-movable steps arranged in line oblique to the line of reciprocation of said frame and adapted to coact with an end thereof to arrest the frame at different distances from the initial position thereof, and a driver controlled by said component-wheel, substantially as described.

65. The combination of an component-wheel, a spring-pressed holding-dog, a pivoted carrier, a frame provided with two rack or ratchet bars and movable to and fro on said carrier in the direction of said bars, independently-movable steps adapted to coact with said bars at different distances from its initial position, means operated by each of said steps for moving said holding-dog away from the wheel, and a driver controlled by said component-wheel; substantially as described.

66. The combination of an component-wheel, a spring-pressed holding-dog, therefor, a pivoted carrier, a rectangular frame provided with rack or ratchet bars and movable to and fro on said carrier in the direction of said bars, steps arranged in line oblique to the line of reciprocation of said frame and independently movable into the path of an end of said frame, means whereby each step disengages said holding-dog from the wheel, and a driver controlled by said component-wheel; substantially as described.

67. The combination of an component-wheel, a spring-pressed holding-dog, therefor, pivoted arm 72 carrying said dog, a pivoted carrier, a rectangular frame movable to and fro on said carrier and provided with rack or ratchet bars, a pivoted ball operatively connected with arm 72 to move the same, a series of levers adapted to operate said ball and provided with stop lugs or projections arranged in a line across and oblique to the direction of the to-and-fro motion of said frame on said carrier, and a driver controlled by the said component-wheel; substantially as described.

68. The combination of an component-wheel 70, a dog 71, pivoted arm 72 carrying said dog, an obliquely-tilted plate 80 pivoted upon the same axis as the arm 72, a rack or ratchet bar frame slidable on said plate 80, a spring for holding said frame against steps on said plate, a pivoted ball, a series of levers 88 provided with steps or projections 94 and constructed to bear on said ball and said ball resting on the arm 72 or projections therefrom, a spring 76 coacting with the dog 71, means whereby the plate 80 and rack-bar frame are connected with the ball

to be moved in one direction thereby, and a driver-plate as 84 coacting with said component-wheel, substantially as described.

69. The combination of adding-wheel, a spring-driven component-controlled driver common to all of said wheels and constructed to operate one of said wheels at a time, a carriage on which one of said driver and adding elements is mounted and means for automatically bringing about the coöperative relation between said driver and said wheels in sequence; substantially as described.

70. The combination of a series of number-wheels independently rotatable on a shaft and each provided with operating and carrying gears, a series of driving-gears independently journaled on a shaft parallel to the first-named shaft and meshing with the operating-gears thereof, a spring-pressed pivoted pawl on each driver-gear over the last, and adapted to coact with the carrying-gear of the number-wheel of next higher denomination with an extension rigid with each pawl and adapted to coact with the second shaft above named to stop the motion of the pawl in one direction; and a single driver which is adapted to coöperate with all of said driving-gears; substantially as described.

71. The combination of a series of number-wheels, independent driving means therefor, and a frame for supporting said parts, with a power-driven driver, an component-wheel connected with said driver, a movable holding-dog coacting with said wheel, a key-controlled variable-thrown endwise-movable rack or ratchet bar movable into and out of mesh with said wheel, a frame for supporting said driver, and means for causing relative motion of said frame to engage the driver and said operating means one at a time, substantially as described.

72. The combination of adding-wheel, independent operating means for said wheel, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, a carriage for said movable element, a plate, a second carriage, key-operated digit-type carrier coacting with said plate, one of said plate and said key-operated digit-type-carrier elements being supported by said second carriage, an component for controlling the rotation of said driver, and means connecting said component and said type-operating mechanism; substantially as described.

73. The combination of adding-wheel, independent operating means for said wheel, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, a plate, a carriage, key-operated digit-type carrier coacting with said plate, an component for controlling the rotation of said driver, and means connecting said component and said type-operating mechanism, with a detent device movable into and out of position for coaction with and for locking said driver against rotation; substantially as described.

74. The combination of adding-wheel, independent operating means for said wheel, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, a carriage for said movable element, a plate, a second carriage, key-operated digit-type carrier coacting with said plate, one of said plate and type-carrier elements being mounted upon said second carriage, a variable-thrown component for controlling the rotation of said driver, and means for connecting said component and said type-operating mechanism; substantially as described.

75. The combination of adding-wheel, independent operating means therefor, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, a plate, a carriage, key-operated digit-type carrier coacting with said plate, a variable-thrown component for controlling the rotation of said driver, and means connecting said component and said type-operating mechanism, with a detent device movable into and out of position for coaction with and for locking the said driver against rotation; substantially as described.

76. The combination of adding-wheel, independent operating means for said wheel, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, a key-controlled component for controlling said driver, and a to-and-fro movable spring-actuated component with said driver-operating spring for setting the same from time to time; substantially as described.

77. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said mechanisms one at a time, said adding mechanism and said driver being movable one past or before the other, an component-wheel connected with said driver, an endwise-movable rack or ratchet bar movable transversely of its length into and out of mesh with said wheel, and a movable detent coacting with said wheel at each transverse movement of the rack, to permit the coöperative movements of the wheel; substantially as described.

78. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a movable detent coacting with said wheel, an endwise-movable rack or ratchet bar movable

transversely of its length into and out of mesh with said component-wheel, and constructed at such movements to coöperate with the said movable detent to permit the component movements of the wheel, and means for operating the endwise motion of said bar at different distances from the initial position of said bar, substantially as described.

79. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a pivoted holding-dog coacting with said wheel, an independently-pivoted carrier, and an endwise-movable rack or ratchet bar on said carrier adapted to be moved thereby transversely into and out of mesh with said wheel and to coöperate at such movements with the said holding-dog, to permit the component movements of the wheel; substantially as described.

80. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a movable holding-dog coacting with said wheel, a rack or ratchet bar for coaction with said wheel, a movable carrier on which said bar is mounted and responsive endwise, and steps movable independently into and out of position for arresting the bar at different distances from its initial position; substantially as described.

81. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a movable holding-dog for coaction with said wheel, a rack or ratchet bar for coaction with said wheel, a movable carrier on which said bar is mounted and responsive endwise, and steps movable independently into and out of position for arresting the bar at different distances from its initial position; substantially as described.

82. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a spring-pressed holding-dog coacting with said wheel, an endwise-movable rack or ratchet bar transversely movable into and out of mesh with said wheel, movable steps for arresting said bar at different distances from its initial position, and connections between said steps and said holding-dog whereby each step moves the dog to release the wheel; substantially as described.

83. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a spring-pressed holding-dog coacting with said wheel, an endwise-movable rack or ratchet bar transversely movable into and out of mesh with said wheel, independently-movable steps for arresting said bar at different distances from its initial position, and connections between said steps and said holding-dog whereby each step moves the dog to release the wheel; substantially as described.

84. The combination of adding-wheel, independent operating means therefor, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a spring-pressed pivoted holding-dog for coaction with said wheel, a pivoted carrier, a rack or ratchet bar movable endwise to and fro on said carrier and adapted to mesh with said wheel, movable steps for arresting said bar at different distances from its initial position, and means operated by said steps for disengaging said dog from the wheel; substantially as described.

85. The combination of adding-wheel, independent operating means therefor, a spring-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a spring-pressed pivoted holding-dog for coaction with said wheel, a pivoted carrier, a rack or ratchet bar movable endwise to and fro on said carrier and adapted to mesh with said wheel, independently-movable steps for arresting said bar at different distances from its initial position, and means operated by each of said steps for disengaging said dog from the wheel; substantially as described.

86. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an component-wheel connected with said driver, a movable holding-dog for said wheel, an endwise-movable rack or ratchet bar for coaction with said wheel, and movable transversely into and out of mesh therewith, and independently-movable steps arranged in line oblique to said bar and adapted to arrest the same at different distances from the initial position thereof; substantially as described.

87. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time

said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected to said driver, a movable holding-dog for said wheel, an endwise-movable rack or ratchet bar movable transversely into and out of mesh with said wheel, independently-movable stops arranged in a line oblique to said bar and adapted to stop the same at different distances from the initial position thereof, and connections whereby each stop operates said holding-dog, substantially as described.

95. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a movable holding-dog coacting with said wheel, a movable carrier, a rack or ratchet bar movable endwise to and fro on said carrier and into and out of mesh with said wheel thereby, independently-movable stops arranged in line oblique to the direction of reciprocation of said bar and adapted to arrest the said bar at different distances from its initial position, and connections whereby each stop operates said movable dog; substantially as described.

96. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time, said adding-wheel and means and said driver being relatively movable, an escapement-wheel connected with said driver, a spring-pressed holding-dog coacting with said wheel, an endwise-movable rack or ratchet bar movable transversely into and out of mesh with said wheel, independently-movable stops arranged in line oblique to the line of endwise motion of said bar and adapted to arrest said bar at different distances from its initial position, and connections intermediate said stops and said dog whereby each stop disengages the dog from the said wheel; substantially as described.

97. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a holding-dog for said wheel, a frame provided with two rack or ratchet bars for coaction with said escapement-wheel, said frame being movable transversely of its length and also movable to and fro in the direction of said bars, and independently-movable stops arranged in line across said frame and adapted to coast therewith to arrest the same at different distances from the initial position thereof in said endwise motion; substantially as described.

98. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one by one, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a holding-dog for said wheel, a frame provided with two rack or ratchet bars for coaction with said escapement-wheel, said frame being movable transversely of its length and also movable to and fro in the direction of said bars, and independently-movable stops arranged in line across said frame and adapted to coast therewith to arrest the same at different distances from the initial position thereof; substantially as described.

99. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a holding-dog for said wheel, a rectangular frame provided with two ratchet-bars for coaction with said wheel and movable into and out of mesh therewith, and frame being movable to and fro in the direction of said bars and independently-movable stops arranged in line oblique to the line of reciprocation of said frame and adapted to coast with an end thereof to arrest the frame and bars at different distances from the initial position thereof; substantially as described.

100. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a spring-pressed holding-dog for said wheel, a pivoted carrier, a frame provided with two rack or ratchet bars adapted to mesh with said wheel and movable to and fro on said carrier in the direction of said bars, independently-movable stops adapted to coast with said frame in arrest it at different distances from its initial position, and means operated by each of said stops for moving said holding-dog away from the wheel; substantially as described.

101. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a spring-pressed holding-dog for said wheel, a pivoted carrier, a rectangular frame provided with rack or ratchet bars adapted to mesh with said wheel and movable to and fro on said carrier endwise of said bars, stops arranged in line oblique to the line of reciprocation of said bars and independently movable into the path of an end of said frame, and means whereby each stop disengages said dog from the wheel; substantially as described.

102. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time,

said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a spring-pressed holding-dog for said wheel, pivoted arm 73 carrying said dog, a pivoted carrier, a rectangular frame provided with rack or ratchet bars adapted to mesh with said wheel and movable endwise of said bars to and fro on said carrier, a pivoted ball connected with arm 73 for moving the same, and a series of levers adapted to operate said ball and provided with stop lugs or projections arranged in a line oblique to the direction of the endwise motion of said frame on said carrier and adapted to coast with said frame, substantially as described.

103. The combination of adding-wheel, independent operating means therefor, a power-driven driver for operating said means one at a time, said driver and said adding-wheel and means being relatively movable, an escapement-wheel connected with said driver, a dog 71 for said wheel, pivoted arm 73 carrying said dog, a pivoted obliquely-slotted plate 80, a spring-pressed rack or ratchet bar frame slidable on said plate 80, a pivoted ball, a series of levers provided with stop lugs or projections resting on said ball and said ball resting on the arm 73 or projections therefrom, a spring 76 coacting with the dog 71, and means whereby the plate 80 and rack-bar frame carried thereby are connected with the ball to be moved in one direction thereby; substantially as described.

104. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel having independent operating means therefor, and said means being at distances apart greater than said step-by-step feed, a second carriage on which said wheel and means are mounted, a driver disengaged from said independent means during a part of the forward traverse of the first-named carriage, motion-multiplying mechanism for connecting said carriages and throwing into operation when the first-named carriage reaches a predetermined point in its forward traverse, a spring for resetting said driver, and an escapement mechanism operated from the type-operating mechanism and controlling the rotary motion of said driver.

105. The combination of a carriage, type mechanism, adding-wheel, independent operating means for said wheel, a second carriage upon which said wheel and independent means are mounted, driving mechanism for said second carriage and normally out of action until the first-named carriage reaches a predetermined point in its forward motion, a spring-driven rotary driver for operating said independent means and disengaged therefrom until the said driving mechanism is thrown into operation, escapement mechanism for controlling said driver and operatively connected with the type mechanism, and mechanism for throwing the driving mechanism for the second carriage into operation when the first-named carriage reaches said point and controlling the motion of the second carriage but permitting it to move faster than the first-named carriage, substantially as described.

106. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel having independent operating means therefor, said means being arranged at distances apart greater than the step-by-step letter-space feed of said carriage, a second carriage upon which said adding-wheel and operating means are mounted, a power-driven driver for operating said independent means one by one and disengaged therefrom during a part of the forward traverse of the first-named carriage, an escapement mechanism operatively connected with the type mechanism and controlling the rotary motion of said driver, speed-multiplying mechanism for connecting said carriages when the first-named carriage reaches a predetermined point in its forward traverse, and a drive-spring for the second carriage thrown into operation when said carriages are connected together, substantially as described.

107. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding mechanism having independent operating means for its number-carriers and said means being arranged at distances apart greater than the step-by-step feed of said carriage, a spring-driven escapement-controlled driver for operating said number-carrier-operating means one at a time and disengaged therefrom during a part of the forward traverse of said carriage, a second carriage upon which the number-carriers and their operating means are mounted, speed-multiplying mechanism continuously connected with one of said carriages and discontinuously connected with the other thereof, and a spring for moving said second carriage but normally inactive until said carriages are coupled together, whereby the motion of the second carriage is greater than but is governed by that of the first-named carriage, substantially as described.

108. The combination of type mechanism, a carriage having a step-by-step letter-space feed, number-carriers, independent operating means therefor spaced apart at distances greater than said step-by-step feed, a spring-driven escapement-controlled driver for but disengaged from said independent means during a part of the forward traverse of the first-named carriage, a rack on said first-named carriage, a pinion with which said rack meshes at a given point in the forward traverse of said first-named carriage, speed-multiplying mechanism connecting said pinion with the second carriage, and a spring automatically thrown or brought into operation

when the first-named carriage is connected with said pinion through said rack, substantially as described.

109. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel, independent operating means for said wheel and said means being at distances apart greater than said step-by-step feed, escapement-controlled driving mechanism for operating said means one at a time and operatively connected with the type mechanism, a second carriage on which one of said parts of said adding mechanism is mounted, and speed-multiplying mechanism for connecting a step-by-step moving part of or connected to the type-writing mechanism with the second carriage when the said first-named carriage reaches a predetermined point in its forward traverse.

110. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel, independent operating means for said wheel and said means being at distances apart greater than said step-by-step feed, escapement-controlled driving mechanism for operating said means one at a time and operatively connected with the type mechanism, a second carriage on which one of said parts of said adding mechanism is mounted, driving mechanism for said second carriage normally out of action until the first-named carriage reaches a predetermined point in its forward motion, and mechanism for throwing the said driving mechanism for the second carriage into operation when the first-named carriage reaches a predetermined point in its forward traverse and controlling the motion of the second carriage but permitting it to move faster than the first-named carriage, substantially as described.

111. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel, independent operating means for said wheel and said means being at distances apart greater than said step-by-step feed, escapement-controlled driving mechanism for operating said means one at a time and operatively connected with the type mechanism, a second carriage on which one of said parts of said adding mechanism is mounted, speed-multiplying mechanism for connecting said carriages when the first-named carriage reaches a predetermined point in its forward traverse, and a drive-spring for the second carriage which is inactive until said is thrown into operation when said carriages are connected together, substantially as described.

112. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel, independent operating means for said wheel and said means being at distances apart greater than said step-by-step feed, escapement-controlled driving mechanism for operating said means one at a time and operatively connected with the type mechanism, a second carriage on which one of said parts of said adding mechanism is mounted, speed-multiplying mechanism continuously connected with one of said carriages and discontinuously connected with the other thereof, and a spring for moving said second carriage but normally inactive until said carriages are coupled together, whereby the motion of the second carriage is greater than but is governed by that of the first-named carriage, substantially as described.

113. The combination of type mechanism, a carriage having a step-by-step letter-space feed, adding-wheel, independent operating means for said wheel and said means being at distances apart greater than said step-by-step feed, escapement-controlled driving mechanism for operating said means one at a time and operatively connected with the type mechanism, a second carriage on which one of said parts of said adding mechanism is mounted, a rack on said first-named carriage, a pinion with which said rack meshes at a given point in the forward traverse of said first-named carriage, speed-multiplying mechanism connecting said pinion with the second carriage, and a spring automatically thrown or brought into operation when the first-named carriage is connected with the second carriage through said pinion and connections.

114. The combination of type mechanism, a pinion, and a power-driven carriage for one of said parts, with independently-operable number-carriers, mechanism for operating said carriers one at a time and controlled from the keyboard of the type mechanism, a second carriage upon which one of said adding-mechanism elements is mounted to move past the other, a drive-spring for said second carriage, mechanism for connecting the second carriage with a step-by-step moving part of the type-writing mechanism when the first-named carriage reaches a predetermined point in its forward traverse, and an escapement mechanism for governing the motion of both of said carriages, substantially as described.

115. The combination of type mechanism, a pinion, and a power-driven carriage for one of said parts, with adding-wheel having independent operating means spaced at distances apart greater than the letter-space feed of said carriage, a driver for operating said means one at a time and controlled from the keyboard of the type mechanism, a second carriage upon which one of said driver and adding-wheel elements is mounted, a drive-spring for said second carriage independent of the power for the first-named carriage, speed-multiplying mechanism for connecting the second carriage with a step-by-step moving part connected to the first-named carriage as the first-named carriage reaches a predetermined point in its

forward traverse, and an escapement mechanism for controlling the motion of both of said carriages, substantially as described.

116. The combination of type mechanism, a pinion, and a power-driven escapement-controlled carriage for one of said parts, with number-wheel having independent operating means therefor placed at distances apart greater than the letter-space feed of the said carriage, a driver for operating said means one at a time and controlled from the keyboard of the type mechanism, a second carriage upon which one of said adding and driver elements is mounted, an independent drive-spring for said second carriage and normally inactive until the first-named carriage reaches a predetermined point in its forward traverse, and speed-multiplying mechanism continuously connected with one and discontinuously connected with the other of said carriages and thrown into operation when the first-named carriage reaches a predetermined point in its forward traverse, substantially as described.

117. The combination of type-writing mechanism having a power-driven escapement-controlled carriage, an adding mechanism operable from the keyboard of the type-writing mechanism and having a part thereof mounted upon a second power-driven carriage, said power for the said second carriage being normally inactive until the carriages are coupled together, and coupling mechanism thrown into operation when the first-named carriage reaches a predetermined point in its forward traverse, substantially as described.

118. The combination of type-writing mechanism having a power-driven escapement-controlled carriage, an adding mechanism having a spring-driven driver, a second carriage upon which part of said adding mechanism is mounted, an independent spring for moving said second carriage and normally inactive until the carriages are coupled together, an escapement for controlling said spring-driven driver and operatively connected with the type-operating mechanism above, and mechanism for coupling said carriages together when the first-named carriage reaches a predetermined point in its forward traverse, substantially as described.

119. The combination of type-writing mechanism having a power-driven escapement-controlled carriage, an adding mechanism having a power-driven escapement-controlled driver operable from the keyboard of the type-writing mechanism and thrown into operation when said mechanisms are coupled together, an independent power-driven carriage on which a part of said adding mechanism is mounted and said independent power being normally inactive until the type-writing and the adding mechanisms are coupled together, coupling mechanism thrown into operation when the first-named carriage reaches a predetermined point in its forward traverse, and means connected with the type-writing mechanism for restoring the power for operating said adding-mechanism driver, substantially as described.

120. The combination of type-writing mechanism having a power-driven escapement-controlled carriage, an adding mechanism operable from the keyboard of the type-writing mechanism and thrown into operation when the said mechanisms are coupled together, an independent power-driven carriage on which part of said adding mechanism is mounted, said independent power being normally inactive until the type-writing and adding mechanisms are coupled together, and coupling mechanism having a discontinuable part and thrown into operation when said part is in one position and when the first-named carriage reaches a predetermined point in its forward traverse and remaining inactive when said discontinuable part is in a different position, substantially as described.

121. The combination of type-writing mechanism having a power-driven escapement-controlled carriage, an adding mechanism having a spring-driven escapement-controlled driver operated from the keyboard of the type-writing mechanism, an independent power-driven carriage on which part of said adding mechanism is mounted, said independent power being normally inactive and said driver being disengaged from the number-carrier of the adding mechanism until the adding and the type-writing mechanisms are coupled together, coupling mechanism thrown into operation when the first-named carriage reaches a given point in its forward traverse, and means for resetting the driver-operating spring during the return movements of the first-named carriage, substantially as described.

122. The combination of type-writing mechanism having a power-driven escapement-controlled carriage, an adding mechanism having a spring-driven escapement-controlled driver operated from the keyboard of the type-writing mechanism, an independent power-driven carriage on which part of said adding mechanism is mounted, said independent power being normally inactive and said driver being disengaged from the number-carrier of the adding mechanism until the adding and the type-writing mechanisms are coupled together, coupling mechanism having a discontinuable part and thrown into operation when said part is in one position and when the first-named carriage reaches a given point in its forward motion and being inoperative to couple up when said part is in a different position, and means connected with the type-writing mechanism for resetting the driver-operating spring during the return movements of the first-named carriage.

116. The combination of key-operated type-writing mechanism having a power-driven component-controlled carriage, an adding mechanism having independently-operable number-carriers and a spring-driven component-controlled driver controlled by certain of said keys, an independent power-driven carriage on which part of said adding mechanism is mounted and said power being normally inactive until said second carriage is coupled with the type-writing mechanism and said driver also being disengaged from the number-carrier operating means until such coupling together, and means for coupling the second carriage with the type-writing mechanism and throwing into operation when the first-named carriage reaches a predetermined point in its forward traverse, substantially as described.

117. The combination of key-operated type-writing mechanism having a power-driven component-controlled carriage, an adding mechanism having independently-operable number-carriers and a spring-driven component-controlled driver controlled by certain of said keys, an independent power-driven carriage on which part of said adding mechanism is mounted and said power being normally inactive until said second carriage is coupled with the type-writing mechanism and said driver also being disengaged from the number-carrier operating means until such coupling together, and coupling mechanism having an adjustable part and adapted when said part is in one position to couple the adding-mechanism carriage with the type-writing mechanism when the first-named carriage reaches a predetermined point in its forward traverse and remaining inactive when said part is in another position, substantially as described.

118. The combination of key-operated type-writing mechanism having a power-driven component-controlled carriage, an adding mechanism having independently-operable number-carriers and a spring-driven component-controlled driver controlled by certain of said keys, an independent power-driven carriage on which part of said adding mechanism is mounted and said power being normally inactive until said second carriage is coupled with the type-writing mechanism and said driver also being disengaged from the number-carrier operating means until such coupling together, coupling mechanism having an adjustable part and adapted when said part is in one position to couple the adding-mechanism carriage with the type-writing mechanism when the first-named carriage reaches a predetermined point in its forward traverse and remaining inactive when said part is in another position, and means connected with the type-writing mechanism and resetting the spring for said adding-mechanism driver at each return of the first-named carriage, substantially as described.

119. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of power-rotated adding-wheels, means for connecting any adding-wheel to any figure-key, and means for enabling the key to limit the arc through which the wheel is power-rotated, substantially as described.

120. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, and a power-driven driver common to all the wheels and constructed to connect any figure-key to any adding-wheel and to also rotate the latter a distance limited by the key, substantially as described.

121. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of power-rotated adding-wheels, means called into action at a predetermined portion of the traverse of the said carriage for connecting any adding-wheel to any figure-key, and means for enabling the key to limit the arc through which the wheel is power-rotated, substantially as described.

122. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, and a power-driven driver common to all the wheels and constructed to be called into action at a predetermined portion of the traverse of the said carriage for connecting any figure-key to any adding-wheel and for also rotating the latter a distance limited by the key, substantially as described.

123. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, means normally called into action at a predetermined point of the traverse of the said carriage for connecting any adding-wheel to any figure-key, and means for rendering the adding-wheel inoperative at will, substantially as described.

124. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, and disconnectable means normally called into action at a predetermined point of the traverse of the said carriage for connecting any adding-wheel to any figure-key, substantially as described.

125. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, a spring for rotating the wheels to perform ad-

dition, and means for resetting the said adding-wheel spring, said resetting means being operated by the carriage during its return movement to begin a new line of writing.

126. The combination of a series of letter and figure types and keys therefor, a power-driven carriage connected for letter-space movements to all the keys, a series of adding-wheels, a spring for rotating the wheels to perform addition, and means for resetting the said adding-wheel spring, said resetting means being operated by the carriage during its return movement to begin a new line of writing.

127. The combination of a series of letter and figure types and keys therefor, a carriage connected for letter-space movements to all the keys, a series of adding-wheels, a spring for rotating the wheels to perform addition, and means for resetting the said adding-wheel spring, said resetting means being operated by the carriage during its return movement to begin a new line of writing.

128. The combination of type mechanism, a carriage, cooperating adding mechanism, and means for applying a source of power independent of that employed to move or control the carriage, to actuate the adding mechanism.

129. The combination of type mechanism, a paper-carriage, cooperating adding mechanism, a second carriage on which a portion of said adding mechanism is carried, and means for applying a source of power independent of that employed to move the type-writer carriage to actuate the carriage of the adding mechanism.

130. The combination of type mechanism, a carriage, adding-wheels, and means for applying a source of power which is independent of the carriage moving or controlling means, to rotate said adding-wheels.

131. The combination of type mechanism, a type-writer carriage, adding mechanism including adding-wheels, a second carriage on which a portion of said adding mechanism is carried, and means for applying a source of power which is independent of the type-writer carriage moving or controlling means, to move the carriage which carries a portion of the adding mechanism and to rotate said adding-wheels.

132. The combination of type mechanism, a type-writer carriage, an adding and registering mechanism which comprises a series of adding-wheels, a movable carriage on which said adding-wheels are mounted, and means for applying a source of power which is independent of the means for moving the type-writer carriage, to actuate or move the carriage which carries the adding-wheels.

133. The combination of type mechanism, a type-writer carriage, an adding and registering mechanism which comprises a series of adding-wheels, a movable carriage on which said adding-wheels are mounted, means for applying a source of power which is independent of the means for moving the type-writer carriage, to actuate or move the carriage which carries the adding-wheels, a driver for rotating said adding-wheels, and means independent of the type-writer carriage driving and controlling means for actuating said driver.

134. The combination of type mechanism, a power-driven type-writer carriage, an adding and registering mechanism which comprises a series of adding-wheels, a carriage for said adding-wheels, said adding-wheels being automatically brought into cooperative relation when the first-named carriage reaches a predetermined point of its travel, and means independent of the type-writer carriage driving means for effecting a movement of the adding-wheel carriage.

709,058. END-GATE AND FASTENING THEREFOR. LEVIN F. FARMER, Salisbury, Ill. Filed Apr. 14, 1902. Serial No. 100,572. (No model.)

Claim.—1. An end-gate composed of two sections hinged together, a securing-brace fixed to one of said sections, an elongated bar fixed to the same section, and fixed by arms integral therewith to said brace, said bar carrying a locking-bolt, a brace secured to the other of said sections and having an eye for the reception of an end of said bolt, substantially as described.

2. The combination with a wagon-body having doors in pairs near its rear end portion, of an end-gate composed of two sections hinged to-

gether at their inner ends, their outer ends being adapted to engage said doors, a securing-brace, an elongated arm, secured to said brace, levers or guides integral with said arm, a bolt carried and supported by said guides or levers, and a brace having an eye with which said bolt engages, substantially as described.

3. An end-gate composed of two sections hinged together, a securing-brace fixed to one of said sections, an elongated bar fixed to the same section, and fixed by arms integral therewith to said brace, said bar carrying a locking-bolt, a brace secured to the other of said sections and having an eye for the reception of one end of said bolt, and bindings or reinforcements on the inner sides and upper surfaces of said sections, as and for the purpose specified.

4. An end-gate composed of two sections, hinged together, a securing-brace fixed to one of said sections, an elongated bar fixed to the same section, and fixed by arms to said brace, said bar having levers, a bolt contained within said levers, and having a handle, a stop for limiting the relative movement of said bolt in either direction, and a brace having an eye for engagement with the end of said bolt, substantially as described.

5. An end-gate composed of sections D, E, braces F, G, arm H, secured to one of said braces, plate O secured to the section D, a bolt J, levers or guides K, K' therefor, plate U, stop L, and brace Q, all combined substantially as and for the purpose specified.

709,054. VALVE FOR VACUUM-PUMPS. WILLIAM F. GARRISON, Brooklyn, N. Y., assignor to Smith & Garrison, Brooklyn, N. Y. Filed Feb. 7, 1901. Serial No. 65,595. (No model.)

Claim.—In a vacuum-pump, the combination with a slide-valve in which are two opposed passages extending through it for communication between the cylinder-ports and the discharge-outlet, valves hinged to the back of said slide-valve for closing said passages, springs for closing said hinged valves, and a cover on the slide-valve forming bearings for said springs and stops to said hinged valves, substantially as herein described.

709,055. KETTLE. LOUIS GRAMMAR, Waukegan, Ill. Filed Mar. 17, 1902. Serial No. 93,002. (No model.)

Claim.—The combination of a kettle having an opening of a size to snugly receive the discharge portion of a funnel, the holder G provided with the eyes b and top c and arranged within the kettle, a bolt extending through said loop c of the holder and a wall of the kettle and fixing the holder in position, a pin passing d in the eye of the holder, a valve pivoted on the pin and arranged to close the said opening, and a spring coiled on the pin, and having one arm bearing against the kettle; and another arm bearing against the inner side of the valve.

709,056. FASTENING DEVICE. CHARLES B. HANCOCK, Chicago, Ill. Filed Aug. 10, 1901. Serial No. 71,500. (No model.)

Claim.—1. A fastening device comprising two members each having an offset portion and an opening at one side of said offset portions, whereby the offset portion on one member may pass through the opening in the other member and be received within the recess formed by the

offset portion on the other member, said offset portions extending in opposite directions when the members of the device are in engagement, substantially as described.

2. A fastening device comprising two members having offset portions projecting in opposite directions and openings at other side of said offset portions forming shoulders, whereby the offset portion of one member may pass through the opening in the other member and be received within the recess formed by the offset portion thereon and the shoulder on the member brought into contact, substantially as described.

3. In a two-part fastening device, the combination with a member having a circular offset portion and a peripheral slot extending substantially around one-half of the circumference of said offset portion said slot adapted to permit the passage therethrough of the oppositely-projecting offset portion of the other member, of interlocking means for retaining the offset portions of the members in engagement and thereby holding the two members of the fastening device, substantially as described.

4. In a fastening device, a member comprising an annular raised portion, a circular projecting portion having a peripheral slot through one-half of its circumference said slot adapted to permit the passage therethrough of a reversely-projecting portion on a cooperating member of the fastening device, a boss located upon said circular projecting portion adapted to interlock with the other member of the fastening device, substantially as described.

5. In a fastening device, the combination with a member having a circular projecting portion through one-half of the periphery of which a slot extends, of a cooperating member having a semicircular oppositely-projecting portion, interlocking means located on the projecting portions of the two members whereby they are retained in engagement with the shoulders formed between the body portion and projecting portion of one member in contact with the corresponding shoulders of the other member, substantially as described.

6. In a two-part fastening device, the combination with a member having an annular raised portion, a circular portion projecting from the side of said member opposite the annular portion, and having a slot extending around one-half of the periphery of said circular portion, of a cooperating member having an annular raised portion, a semicircular portion projecting from the side of said second member opposite from its annular portion and interlocking bosses extending from said projecting portions in the same direction as the annular raised portions thereof, whereby when the semicircular portion of one member is passed through the peripheral slot in and overlaps the circular projecting portion of the other member, the bosses will interlock and retain the members in engagement, substantially as described.

709,057. TABLE. HENRY M. HANSEN, Janesville, Wis., assignor to Hansen Furniture Company, Janesville, Wis., a Corporation of Wisconsin. Filed Feb. 28, 1902. Serial No. 4,200. (No model.)

Claim.—1. A table comprising a central fixed section of polygonal form, a series of leaf-sections adapted to be adjusted edge to edge in direct engagement, and in the same plane with said central section, tripart hinged connections uniting said central and leaf sections and whereby the latter are capable of folding into a plane parallel with and beneath the central section, and means for holding said leaf-sections both in extended and folded positions.

2. A table, comprising in combination a polygonal central section having a suitable support, leaf-sections hinged thereto, and strips forming parts of the hinge connections, said strips being adapted to provide, when the leaves are folded, valance-strips, substantially as described.

3. A table, comprising in combination a central section of rectangular form mounted upon a suitable support and having leaf-sections hinged thereto, said hinge-connections comprising a member secured to the central section, a member secured to the leaf and an intermediate member to which the secured members are connected, which constitutes a filling-piece between the central section and the leaf when the latter is closed, whereby said leaves may be unfolded and extended in the plane of the table-top and folded beneath, parallel to and at a distance from said top, as and for the purposes set forth.

4. A table comprising in combination a rectangular central section having a suitable support and segmental leaf-sections hinged thereto, strips forming a part of the hinge connection, said strips being adapted to pro-

vide, when the leaves are folded, with or rim-stripe, substantially as described.

5. Is a table, the combination with a central section of general rectangular form, having its corners truncated, of strips hinged to said under side adjacent and parallel to its edges, leaf-sections hinged to said strips and supports for said leaf-sections in their extended position, and other supports for said leaves when in their folded position, substantially as described.

6. A table comprising a central fixed section of polygonal form, a series of leaf-sections adapted to be adjusted edge to edge in direct engagement, and in the same plane with, said central section, tri-part hinge connections uniting said central and leaf sections and whereby the latter are capable of folding into a plane parallel with and beneath the central section, the intermediate members of the tri-part hinges constituting valance-pieces between the central and leaf sections when in a folded position.

7. A table comprising a central fixed section of polygonal form, a series of leaf-sections adapted to be adjusted edge to edge in direct engagement, and in the same plane with, said central section, tri-part hinge connections uniting said central and leaf sections and whereby the latter are capable of folding into a plane parallel with and beneath the central section, the intermediate members of the tri-part hinges constituting valance-pieces between the central and leaf sections when in a folded position, and being entirely concealed from above when in extended position.

702,058. GRAIN-ELEVATOR FOR SEPARATORS. HART. R. HART, Fourth, N. Y. Filed Nov. 9, 1901. Serial No. 81,908. (No model.)

Claim.—1. In a grain-elevator, an elevator-tube constructed to be supported upon the side of a separator or the like with its top inclined outward therefrom, in combination with a discharge-spout centered to the tube, arranged to discharge the grain in a direction parallel to the supporting-machine, and having its discharge end formed at an angle to the tube, so that when the tube is inclined the discharge end of the spout will be in a horizontal plane.

2. In a grain-elevator, an elevator-tube provided with a discharge-spout, twisted to extend at an angle thereto, substantially as described.

3. A grain-elevator, comprising an elevator-tube constructed to be supported upon the side of a separator or the like, with its top inclined outward therefrom, and to deliver the grain in a direction parallel to the supporting-machine, said tube being provided with a discharge-spout having its discharge end formed at an angle to the tube to terminate in a horizontal plane when the tube is inclined, in combination with means for elevating the grain in said tube and delivering it to the spout.

4. A grain-elevator, comprising a tube constructed to be supported upon the side of a separator or the like in an inclined position, and to elevate and deliver the grain in a direction parallel to the supporting-machine, said tube being provided with a discharge-spout constructed to extend vertically when the tube is inclined, in combination with means for elevating the grain in the tube and discharging the same through the spout.

5. A grain-elevator, comprising a tube constructed to elevate and deliver the grain in a direction parallel to the supporting-machine, and means

for supporting said tube upon the side of a separator or the like at an inclination thereto, in combination with a discharge-spout centered to the tube and having its free end formed to extend in a horizontal plane when the tube is inclined, and elevating means arranged in the tube.

6. In a grain-elevator, an elevator-tube provided with a discharge-spout having its end twisted to extend at an angle to the tube, in combination with means for adjusting the inclination of said tube and retaining the same in said adjusted position, substantially as described.

7. In a grain-elevator, an elevator-tube provided with a discharge-spout, the discharge end of said spout being extended in the general direction of the tube but twisted at an angle to said tube, in combination with means for pivotally supporting the said tube, and means for adjusting the inclination of the same and retaining the tube at each inclination, substantially as described.

8. In a grain-elevator, an elevator-tube provided with a discharge-spout constructed to discharge the grain in a direction parallel to the supporting-machine, but at an angle to the inclination of the tube, in combination with means for pivotally supporting said tube upon the side of a separator or the like at an inclination means for adjusting the inclination of said tube and retaining the same in position, and means for elevating the grain in said tube and discharging the same into said spout, substantially as described.

9. A grain-elevator, comprising a tube 3, provided with supporting straps or collars 4, secured to a shaft 5, a bracket 2, adapted to be secured to the supporting-frame and to pivotally support the said shaft 5, in combination with a power driving-shaft 17 provided with gear-wheel 22, the elevator driving-shaft 20, provided with gear-wheel 23, and an intermediate pinion inserted between said gear-wheels, and an adjusting-bar at the top of the tube adapted to regulate the inclination of the same, substantially as described.

10. A grain-elevator, comprising a tube 3, provided with supporting straps or collars 4, secured to a shaft 5, and a bracket 2, adapted to be secured to a supporting-frame and to pivotally support the said shaft 5, in combination with a power driving-shaft 17, provided with gear-wheel 22, the elevator driving-shaft 20 provided with a gear-wheel 23, an intermediate pinion inserted between the said gear-wheels and means for adjusting the inclination of the tube 3 and maintaining the same in position, substantially as described.

11. An elevator-tube for separator and the like, constructed to deliver the grain in a direction substantially parallel to the supporting-machine, and having its discharge end twisted to extend at an angle to the tube.

702,059. VEHICLE. JAMES F. HATHAWAY, Somerville, Mass. Filed Oct. 26, 1901. Serial No. 80,988. (No model.)

Claim.—A vehicle-body having a permanent seat located on the front edge thereof and being in the front, provided with a detachable front door, in combination with a detachable extension adapted to form a footboard for said front seat, and means for temporarily attaching said extension to said vehicle-body, whereby said extension may be used to make said front seat available, said front door being removed or said extension being removed, and said front door being removed or said extension being removed.

extension being removed, said front door may be utilized to close and form a finish to the front of the vehicle, as described.

702,060. FLASHING-TANK FOR GLASS. LOUIS F. MATTHEW, Lumburg, Mass., assignor of one-half to Henry R. Conway and Charles F. Conway, Fitchburg, Mass. Filed Nov. 28, 1902. Serial No. 87,908. (No model.)

Claim.—1. A closed tank, an outlet-pipe leading therefrom, a valve in said pipe to control the discharge from the tank, the said outlet-pipe between the tank and valve being provided with a throat of gradually decreasing cross-sectional area from the tank to the valve, and a supply-pipe leading into the outlet-pipe and extended into the contracted portion thereof between the tank and valve.

2. A closed tank, a straight outlet-pipe connected to the bottom portion of said tank, a valve in said pipe for controlling the discharge from the tank, the opening in the said outlet-pipe gradually contracting from the tank to the valve, and a supply-pipe concentric with said outlet-pipe and extended into the contracted portion thereof above the valve.

3. A closed tank, a discharge-pipe leading from its bottom, a controlling-valve in said pipe, the said pipe contracting gradually between the tank and valve, a relatively small supply-pipe concentric with the discharge-pipe and extended into the latter, the end of the supply-pipe being located in the contracted portion of the discharge-pipe between the valve and tank.

4. A closed tank, a discharge-pipe communicating with its bottom, a supply-pipe entering the top of the tank and extended downward into and concentric with the discharge-pipe, a controlling-valve in the latter, beyond the mouth of the supply-pipe, a manual actuator for the valve, and means to automatically close the valve.

5. A closed tank having a large outlet in its lower end, a discharge-pipe leading therefrom and having a contracted throat, the outlet forming the entrance throat, a relatively small supply-pipe entering the tank through its upper end and extended downward through the outlet and into the throat concentric therewith, and a controlling-valve in the discharge-pipe beyond the mouth of the throat, a rotatable spindle on which said valve is threaded to slide, and means for turning said spindle.

702,061. FOOT-DRUMMER FOR BOWLING-ALLEYS. SYLVANUS L. HANSEN, New York, N. Y., assignor of one-half to William Gordon, New York, N. Y. Filed Apr. 12, 1902. Serial No. 88,771. (No model.)

Claim.—A foot-drummer for bowling-alleys, composed of a suitable receptacle for the retention of water, and a saturated sponge and

provided with a cover composed of a surrounding frame, within which is fitted a diaphragm-like sheet of rubber, perforated as specified, and adapted to bridge up and down, all in the manner and for the purpose hereinbefore set forth.

702,062. REFRIGERATING APPARATUS. EDWARD W. HOWELL, New York, N. Y., assignor to Herbert L. May, New York, N. Y. Filed June 2, 1901. Serial No. 86,804. (No model.)

Claim.—1. In apparatus adapted for use either as the still or absorber of refrigerating apparatus, the combination of a chamber for heating or cooling the liquor, two equalizing-chambers arranged above the heating or cooling chamber so that the entire body of liquor in each equalizing-chamber shall be at a higher level than the body of liquid in the heating or cooling chamber and pipes freely connecting each of the equalizing-chambers with each other and with the lower chamber, and means connected only with the lower chamber for heating or cooling the liquor therein, whereby a circulation of the liquor will be established back and forth among the chambers, and the distillation of the gas from the liquor or its absorption therein will thereby be assisted.

2. In apparatus adapted for use either as the still or absorber of refrigerating apparatus, the combination of a chamber for heating or cooling the liquor, two equalizing-chambers arranged above the heating or cooling chamber, a pipe connecting the equalizing-chambers with each other, two pipes freely connecting each equalizing-chamber with the lower chamber and having their mouths opening into one of the said chambers at different heights therein to permit a free flow of the liquor back and forth between each equalizing-chamber and the lower chamber, whereby a circulation of the liquor will be established back and forth among the chambers, and the distillation of the gas from the liquor or its absorption therein will thereby be assisted.

3. In apparatus adapted for use either as the still or absorber of refrigerating apparatus, the combination of two chambers for the liquor arranged one above the other and connected with each other by means of three pipes, one pipe running from near the bottom of the lower chamber to the top of the upper chamber, and opening therein another of the said pipes running from the top of the lower chamber and having its mouth opening into the upper chamber at a point part way between the top and the bottom of the said chamber, and the third pipe running from the top of the lower chamber to the bottom of the upper chamber, and means connected with the lower chamber for heating or cooling the liquor therein, whereby a circulation of the liquor will be established back and forth between the two chambers, and the distillation of the gas from the liquor or its absorption therein will thereby be assisted.

4. In apparatus adapted for use either as the still or absorber of refrigerating apparatus, the combination of a chamber for heating or cooling the liquor, two equalizing-chambers arranged above the heating or cooling chamber, a pipe connecting the equalizing-chambers with each other, and three pipes connecting each equalizing-chamber with the lower chamber, one pipe running from near the bottom of the lower chamber

to the top of the said equalizing-chamber and projecting downward there-in and provided in the said downward projection with openings for the escape of gas, another of the said pipes running from the top of the lower chamber and having its mouth opening into the said equalizing-chamber at a point part way between the top and the bottom of the said chamber, and the third pipe running from the top of the lower chamber to the bot-tom of the said equalizing-chamber, and means connected with the lower chamber for heating or cooling the liquor therein, whereby a circulation of the liquor will be established back and forth among the chambers, and the distillation of the gas from the liquor or its absorption therein will thereby be assisted.

702,068. BOTTLE-WASHING MACHINE. JOSEPH KAYNE, Phila-delphia, Pa. Filed Sept. 20, 1901. Serial No. 70,708. (No model.)

Claim.—1. In a bottle-washing machine, a casing adapted to sur-round the brushes and other rotatable parts of the machine, said casing having a base provided with a series of perforations adapted to permit of the free passage of water from the casing and the rotation of paper or other impurities within said casing, and a water-distributing T-shape de-vice arranged within said casing.

2. In a bottle-washing machine, a casing adapted to surround the brushes and other rotatable parts of the machine, the roof of said casing being arched and the base flat and perforated, in combination with a lid for the front of said casing having a laterally-projecting flange engaging the casing and an opening arranged in alignment exactly with the space between the brushes, and a water-distributing T-shape pipe arranged within said casing.

702,064. METALLURGICAL FILTER. FREDERICK H. LOMB, Chi-cago, Ill. Filed June 24, 1901. Renewed Feb. 27, 1902. Serial No. 85,945. (No model.)

Claim.—1. In metallurgy filter, the combination with the closed perforated tank having an internal fabric capstan with stretcher-frame therefor to rest against the tank-wall of the feed-pipe leading into the tank-bottom and the separate wash-water-pressure tube united to said feed-pipe between the inlet and outlet valves thereof, substantially as de-scribed.

2. In metallurgy filter, the combination with the closed, perfo-rated tank having an internal fabric capstan and external drip-pan, of the feed-pipe opening into the tank-bottom and the separate wash-water-pres-sure tube, substantially as described.

3. In metallurgy filter, the combination with the closed, perfo-rated tank having an external drip-pan and an internal fabric capstan with stretcher-frame therefor to rest against the tank-wall, of the feed-pipe leading into the tank-bottom and the separate wash-water-pressure tube united to said feed-pipe between the inlet and outlet valves thereof, sub-stantially as described.

4. In metallurgy filter, the combination with the closed perfo-rated vertical tank having an internal fabric capstan with stretcher-frame therefor to rest against the tank-wall of the feed-pipe discharging into said tank and the wash-water-pressure tube leading into the tank-bottom, substantially as described.

702,065. EXPLOSIVE PAPER TOY. MORRIS T. LYNN and ALBERT R. HENSON, Brooklyn, N. Y., assignors to the National Folding Box & Paper Company, New Haven, Conn., a Corporation of New Jer-sey. Filed Jan. 12, 1901. Serial No. 48,000. (No model.)

Claim.—1. A knock-down or collapsible toy-blank, comprising a heel-section, a deck-section and hull-section, the latter being formed at their folding-points with upward curves which give a rake to the bow and stern of the boat when set up.

2. The combination of a frangible receptacle shaped to simulate a war vessel and provided with an opening in its top side, and an explosive device inserted in said opening, and projecting within the receptacle and the base of each device being exterior of the receptacle, substantially as set forth.

702,066. DEVICE FOR CHARGING OR DISCHARGING LIMITED-TANKS. SHERMAN W. MILLER, Chicago, Ill. Filed June 4, 1901. Se-rial No. 65,261. (No model.)

Claim.—1. The combination with a tank or receptacle, of a siphon having a sealed trap at its discharge end, said trap being so proportioned that the maximum liquid head in said tank is insufficient to start the si-phon in operation, of means for producing pressure in said siphon to start the operation thereof comprising a pipe communicating with said siphon and having a sealed discharge end, and means acting to produce air-pres-sure in said pipe which pressure is transmitted to the siphon to force the seal in the trap thereof.

2. An apparatus for the purpose set forth comprising a chamber, a siphon having a sealed trap at its discharge end, and means for starting the siphon into operation embracing a second receptacle or tank and a siphon connected with the same and provided with a sealed discharge end which communicates with the main siphon.

3. An apparatus for the purpose set forth comprising a chamber, a siphon having a trap at its discharge end and means for starting the said siphon into operation comprising a second chamber to which water is sup-plied from the source supplying the first chamber, a siphon in said second chamber provided with a sealed discharge and which communicates with the first-named siphon.

4. An apparatus for the purpose set forth comprising a main cham-ber, a main siphon having a trap at its discharge end and means for start-ing said main siphon comprising a second chamber, and a siphon in said second chamber the discharge end of which extends into the said main

siphon below the level of the water seal of the trap at the discharge end of said main siphon.

5. The combination with a principal siphon and an auxiliary siphon which latter discharges into and through the principal siphon, of means affording a seal between said principal siphon and the discharge-head of the auxiliary siphon.

6. An apparatus for the purpose set forth comprising a principal chamber, a discharge siphon-head in said chamber being insufficient to start said siphon into operation, an auxiliary chamber, and a siphon in the auxiliary chamber, the discharge-head of which enters the trap of the principal siphon below the normal liquid-level thereof after each opera-tion of the siphon.

7. The combination with a tank or receptacle, of a siphon therein having a sealed trap at its discharge end, the said trap being so propor-tioned that the maximum liquid head in the tank is insufficient to start the siphon into action, and means for producing pressure in said siphon to start the same, comprising a pipe communicating at one end with the siphon and having a sealed discharge end, and a chamber with which the other end of the pipe communicates, and means connected with said pipe in said chamber acting to produce pressure in the pipe and to transmit the same to the siphon upon the rise of water in said chamber, said parts being constructed to empty said chamber through said pipe when the siphon is brought into action.

8. An apparatus for the purpose set forth comprising a chamber, a siphon having a sealed trap at its discharge end, said trap being so pro-portioned that the maximum liquid head in the tank will not start the siphon into action, and means for starting the siphon into operation em-bracing a second receptacle or tank and a siphon connected with the same and provided with a sealed discharge and which communicates with the main siphon.

702,067. EXPANSION-FASTENER. EDWIN J. MCCORMACK, Syra-cuse, N. Y., assignor to the McCormack Manufacturing Company, New York, N. Y., a Corporation of West Virginia. Filed Mar. 21, 1902. Re-newed Apr. 10, 1902. Serial No. 102,204. (No model.)

Claim.—1. The combination of a sleeve consisting of a sheet-metal blank having its side edges separated for forming a lengthwise slot in the sleeve, and a substantially conical nut movable within the sleeve and hav-ing its periphery engaged with the inner face of the sleeve and provided with a tapering rib movable in said slot, substantially as and for the pur-pose described.

2. The combination of a sleeve having an intermediate portion formed more yielding than contiguous portions thereof, and means for compress-ing the sleeve endwise and buckling outwardly said intermediate portion, substantially as and for the purpose set forth.

3. The combination of a sleeve having an intermediate portion formed of less thickness than its ends and having one of its ends movable endwise toward the other for buckling outwardly said intermediate portion of the sleeve and an expanding-nut movable within said one of the ends of the sleeve, substantially as and for the purpose described.

4. The combination of a sleeve consisting of a sheet-metal blank hav-ing its intermediate portion formed of less thickness than its ends and hav-ing its side edges separated for forming a lengthwise slot in the sleeve, and a nut movable with the sleeve and provided with a tapering rib mov-able in said slot, substantially as and for the purpose set forth.

5. The combination of a sleeve having a lengthwise slot, and a sub-stantially conical nut movable within the sleeve and having its periphery engaged with the inner face of the sleeve and provided with a longitudi-nal rib movable in the slot of the sleeve, said rib having its opposite sides inclined forwardly toward each other, and having opposite portions there-of extended outwardly from said periphery in substantially parallel planes, substantially as and for the purpose specified.

6. The combination of a sleeve having a lengthwise slot, and a sub-stantially conical nut movable within the sleeve and having its periphery engaged with the inner face of the sleeve and provided with a tapering rib projecting into the slot and with engaging surfaces extending laterally from the base of the rib beyond the side walls of the slot and engaged with the inner face of the sleeve, substantially as and for the purpose set forth.

7. The combination of a sleeve having a lengthwise slot, and a sub-stantially conical nut movable within the sleeve and having its periphery engaged with the inner face of the sleeve and provided with longitudinal

ribs having their outer faces engaged with the inner face of the sleeve, substantially as and for the purpose described.

8. The combination of a sleeve having a lengthwise slot, and a sub-stantially conical nut movable within the sleeve and having its periphery provided with longitudinal ribs increasing in width toward their forward ends and having their outer faces engaged with the inner face of the sleeve, substantially as and for the purpose specified.

9. The combination of a sleeve having a lengthwise slot, and a sub-stantially conical nut movable within the sleeve and having its periphery engaged with the inner face of the sleeve, and provided with longitudinal grooves decreasing in width toward their forward ends, substantially as and for the purpose set forth.

10. The combination of a sleeve having separated lengthwise slots, and a substantially conical nut movable within the sleeve and having its periphery engaged with the inner face of the sleeve, and provided with longitudinal ribs projecting from said slots into the slots of the sleeve and having their opposite sides engaged with the walls of said slots, substantially as and for the purpose described.

11. The combination of a sleeve having separated lengthwise slots, and a substantially conical nut movable within the sleeve and provided with separated longitudinal ribs projecting from its periphery and mov-able in the slots of the sleeve, said ribs being also provided with additional ribs interposed between the former ribs and having their outer faces en-gaged with the inner face of the sleeve, substantially as and for the pur-pose specified.

12. The combination of a sleeve having separated lengthwise slots, and a substantially conical nut movable within the sleeve and provided with separated longitudinal ribs projecting from its periphery into the slots of the sleeve and having their opposite sides inclined forwardly to-ward each other and opposite portions of said ribs extended outwardly from the periphery of the nut in substantially parallel planes, said ribs being also provided with additional ribs interposed between the former ribs for engaging the inner face of the sleeve and having their opposite sides inclined forwardly toward each other, substantially as and for the pur-pose set forth.

13. The combination of a sleeve having separated lengthwise slots, and a substantially conical nut movable within the sleeve and provided with separated longitudinal ribs projecting from its periphery into the slots of the sleeve and having their opposite sides inclined forwardly to-ward each other and opposite portions of said ribs extended outwardly from the periphery of the nut in substantially parallel planes, said ribs being also provided with engaging surfaces extending laterally from the base of the ribs and inclining forwardly toward each other, substantially as and for the purpose described.

14. As a new article of manufacture, the herein-described expan-sion-fastener, the same being composed of a sheet-metal blank having its side edges separated for forming a lengthwise slot in the sleeve, and having an intermediate portion formed of less thickness than its ends and having one of its ends movable endwise toward the other for buckling outwardly said intermediate portion of the sleeve, substantially as and for the pur-pose specified.

15. As a new article of manufacture, the herein-described nut for expansion-fasteners, the same being formed substantially conical and hav-ing its periphery provided with projecting longitudinal ribs the opposite sides of which incline forwardly toward each other, engaging surfaces ex-tending laterally from the base of the ribs and inclining forwardly toward each other, and additional ribs interposed between said engaging surfaces, substantially as and for the purpose set forth.

702,068. OIL-GUYP. JOHN R. L. MCKINNEY, Railway, N. J. Filed Jan. 12, 1902. Serial No. 65,622. (No model.)

Claim.—1. In a lubricator for use on moving parts of machinery, the valve-rod B and the collar H adjustable thereon, and the piston arm I' arranged to be vibrated by its momentum, in combination with the fork D' D' limiting its play, and with the toe F' rigidly connected to each arm and extending horizontally, adapted to fit said valve-rod at one ex-treme of its travel, all arranged for joint operation substantially as herein specified.

2. In a lubricator for use on moving parts of machinery, the valve-red B and the collar M adjustable thereon, and the pendant arm P arranged to be vibrated by its momentum, in combination with the fork D¹ D² limiting its play, and with the two F rigidly connected to each arm and extending horizontally, arranged to lift said valve-red at one extreme of its travel, and the means of communicating with the oil-passage below and receiving the nearly tight-fitting base of the said red, adapted to form a partial vacuum at each vibration, and with the spring F and adjustable pin G adapted to vary the force with which the red shall be depressed, all arranged in curve substantially as herein specified.

702,069. IRONING-BOARD. CHARLES W. FANNING and CHARLES R. KARR, Philadelphia, Pa. Filed Apr. 16, 1901. Serial No. 94,000. (No model.)

Claim.—In an ironing-board, an approximately C-shaped bracket having a nose, means for securing the bracket to a support, studs extending transversely below the upper surface of the nose of the bracket, a plate having hooks thereon slightly separated to embrace the nose of the bracket, said hooks engaging the sides of the nose to prevent sidewise displacement of the board and said hooks projecting outwardly and slightly downwardly to engage the studs of the nose.

702,070. OIL-CAN. WILLIAM J. PARK, Boston, Mass. Filed Sept. 11, 1901. Serial No. 75,000. (No model.)

Claim.—1. The combination, with an oil-can, of an air-vent pipe formed of a continuous tubular link which projects partially from the upper part of the can, said link having a hole at its lower part inside the can and a bulb at one side of it outside the can said bulb being provided with a lateral hole, substantially as set forth.

2. The combination, with an oil-can, and a cap for closing it; of an air-vent pipe formed of a tubular link which projects through the cap and has an air-hole at its lower part, said air-vent pipe having also an enlargement provided with a lateral air-hole in one of its side portions above the cap, substantially as set forth.

702,071. CLEARING ATTACHMENT FOR HARROWS. WARREN PARKMAN, John, Cal. Filed Oct. 20, 1901. Serial No. 93,500. (No model.)

Claim.—1. The combination with a harrow, of revolvable segments thereon and means for normally retaining them out of contact with the ground, said segments being weighted forward of their axis of rotation whereby they are turned to come in contact with the ground when released.

2. The combination with a harrow of a shaft journaled thereon, seg-

ments fixed to the ends of the shaft and means weighting the segments forward of the shaft, means including a stop on the shaft and a spring-pressed member engaging the stop, for normally retaining the segments out of contact with the ground, and means for withdrawing the spring-pressed member from its engagement with the stop.

3. The combination with a harrow of a shaft journaled thereon, segments fixed to the shaft, means on the segments weighting them forward of the shaft, means normally retaining the segments out of contact with the ground, and means for releasing the segments to allow the weights to operate to bring the segments in contact with the ground.

4. The combination in a harrow of a single shaft journaled thereon and having a stop fixed to the shaft between its ends and a spring-pressed member on a right part of the harrow and adapted to engage said stop in normally retain the segments out of contact with the ground, and means for withdrawing the spring-pressed member out of engagement with the stop to allow the shaft to rotate and the segments to engage with the ground, said spring-pressed member automatically engaging the stop and locking the segments in normal position when the latter have completed their revolvable movement.

5. The combination with a harrow of a shaft journaled transversely thereon, segments fixed and revolvable with the shaft, a catch carried by the shaft and a latch carried by the harrow and engaging the catch to normally retain the segments with the convex side upward, weights carried by the segments forward of the shaft whereby they are turned to come in contact with the ground when released.

6. The combination with a harrow of a shaft journaled transversely thereon, segments fixed and revolvable with the shaft, a catch carried by the shaft and a latch carried by the harrow and engaging the catch to normally retain the segments with the convex side upward, weights carried by the segments forward of the shaft whereby they are turned to come in contact with the ground when released, and spurs or points projecting from the segments to engage the ground and cause the segments to turn.

702,072. SCORE-BOARD FOR BOWLING-ALLEYS. JAMES PAUL and GEORGE F. ROCHER, Chicago, Ill. Filed July 20, 1901. Serial No. 70,000. (No model.)

Claim.—1. In a score-board for bowling-alleys, the combination of a frame portion, a backing-board therein, a supply-roll formed of a hollow cylinder provided with a pivot at one end and slotted at the other hollow end, and a receiving-roll formed of a hollow cylinder pivoted at one end and slotted at the other, a pivot-plate for removably holding each pivots in position, and shafts rotatably mounted in the frame portion provided with flutings to removably engage the hollow slotted ends of the rolls, substantially as described.

2. In a score-board for bowling-alleys, the combination of a frame portion, a backing-board therein, a supply-roll formed of a hollow cylinder provided with a pivot at one end and slotted at the other hollow end, a receiving-roll formed of a hollow cylinder pivoted at one end and slotted at the other hollow end, a pivot-plate for removably holding each pivots in position, shafts rotatably mounted in the frame portion provided with flutings to removably engage the hollow slotted ends of the rolls, and spring-pressed levers on the pivot-plate for yieldingly holding the pivots of the rolls in engagement with the pivot-plate, substantially as described.

3. In a score-board for bowling-alleys, the combination of a frame portion, a backing-board therein, a supply-roll formed of a hollow cylinder provided with a pivot at one end and slotted at the other hollow end, a receiving-roll formed of a hollow cylinder pivoted at one end and slotted at the other hollow end, a pivot-plate for removably holding each pivots in position, shafts rotatably mounted in the frame portion provided with flutings to removably engage the hollow slotted ends of the rolls, spring-pressed levers on the pivot-plate for yieldingly holding the pivots of the rolls in engagement with the pivot-plate, where-when on

the shaft-shells, and spring-pressed pawls engaging the wave-which to yieldingly hold said rolls in their desired position, substantially as described.

4. In a score-board for bowling-alleys, the combination of a frame portion, a backing-board therein, a supply-roll formed of a hollow cylinder provided with a pivot at one end and slotted at the other hollow end, a receiving-roll formed of a hollow cylinder pivoted at one end and slotted at the other hollow end, a pivot-plate for removably holding each pivots in position, shaft-shells rotatably mounted in the frame portion provided with flutings to removably engage the hollow slotted ends of the rolls, spring-pressed levers on the pivot-plate for yieldingly holding the pivots of the rolls in engagement with the pivot-plate, where-when on the shaft-shells, spring-pressed pawls engaging the wave-which to yieldingly hold said rolls in their desired position, and ball-and-rod ends on the shaft-shells arranged to be engaged by a proper key and rotated thereby in one direction only, substantially as described.

702,073. SUPPORT AND SWITCH FOR ELECTRIC DENTAL INSTRUMENTS. ROBERT G. PARKER, New York, N. Y. Filed Jan. 1, 1900. Serial No. 55,000. (No model.)

Claim.—1. A support and switch for an electric dental instrument comprising a switch board, an electric circuit, and a clamp comprising two strips of spring metal, the lower ends of which are supported upon the switchboard, and are connected with said circuit, and the upper ends converge and contact with each other when free to do so, said upper ends being shaped to receive an electric dental instrument, and thereby break said contact, in combination with such an instrument having a stem of insulating material arranged to be interposed between said strips and thus break the circuit between them, the wires of said instrument being in said circuit, substantially as described.

2. A support and switch for electric dental instruments comprising a switchboard, a plurality of switches thereon, each comprising two strips of spring metal secured at their lower ends to said switchboard, their upper ends converging toward each other and contacting when free to do so, said upper ends being suitably bent to receive the stem of an electric dental instrument and thereby break said contact, in combination with a corresponding plurality of electric dental instruments, the wires of which are connected in parallel with the members of the switches, and the members of the switches being connected in parallel with the source of supply of electricity, and each instrument having a stem of insulating material arranged to be interposed between the switch members when the instrument is hung up, substantially as described.

702,074. LATCH. GEORGE E. PARKER, New York, N. Y. Filed Nov. 11, 1901. Serial No. 75,000. (No model.)

Claim.—Is a latch, the combination, with a frame provided with a stationary front plate having an inner keyhole, of an outer keyhole on the said front plate having a stationary plate provided with an outer keyhole which is arranged out of line with the aforesaid inner keyhole, and a projecting guide-pin for the key arranged on the axis of the two said keyholes, substantially as set forth.

702,075. LIQUID-PRESSURE REGULATOR. MAXIMILIAN PERK, New York, N. Y. Filed Jan. 20, 1900. Serial No. 51,000. (No model.)

Claim.—In a liquid-pressure regulator, the combination of a valve with a seating valve, a diaphragm connected to the valve, a spring in-creasing the diaphragm, a pair of curves, one embracing the curves, and a hole that pivotally connects the valve with the spring, substantially as specified.

702,076. CENTRAL-TURN HOLDER FOR WINDING-MACHINES. CHARLES E. KELLY, Boston, Mass., assignor to Howard and Bullough American Machine Company, Limited, Portsmouth, N. I. Filed Nov. 22, 1901. Serial No. 65,000. (No model.)

Claim.—1. A shell-holder having an arbor provided with a central screw-threaded end, and a spring-supported central cap loose on the arbor, in combination with means for rotating the arbor with respect to the cap, as described.

2. A shell-holder for winding-machines, having a central arbor spirally threaded to engage with the shell near one end, a central cap loose on the arbor, means for turning the arbor with respect to the cap, in combination with a spring-support for the central cap, as described.

3. In a shell-holder for winding-machines, the combination with the arbor A, the spiral threads D' on the arbor and the radial arm F, of the cap E and the spiral spring H, whereby the shell is supported concentric with the arbor, as described.

702,077. WINDOW-SCREEN. HERBERT E. KIMMER, Leroy, N. Y. Filed Nov. 20, 1901. Serial No. 50,000. (No model.)

Claim.—1. The combination with a window-frame, and a mesh mounted therein, of a screen movable with the mesh, opposite catches carried by the free end of the screen and working between the mesh and the respective sides of the window-frame, and endwise-movable bolts carried by the mesh for engagement with the catches to detachably connect the screen to the mesh.

2. The combination with a window-frame, and a mesh mounted thereon and provided with open-ended recesses in its opposite outer edges, of a screen movable with the mesh, opposite catches carried by and projected

from the screen and normally lying within the recess in the opposite edge of the ash, and locking-belt placing the respective side rails of the ash from the inner to the outer edge thereof, the outer end of the belt working in the recess for engagement with the adjacent catches, and the inner end of the belt being accessible for adjustment at the inner edge of the side rail.

2. The combination with a window-cash having opposite terminal open-ended recesses formed in the opposite outer edges thereof, of a screen having opposite catches projected beyond the free end thereof and normally received within the recesses of the ash, a belt-casing placing each side rail of the ash from the inner to the outer edge thereof, and having a longitudinal slot and a transverse notch communicating therewith, and an endwise-movable spring-actuated belt working within the casing and having a lateral projection working in the slot and adapted to enter the notch to hold the belt rotated, the outer end of the belt working in the recesses in the ash and provided to automatically engage the catch at the closed limit of the ash, and the opposite end of the belt being accessible at the inner edge of the side rail.

4. The combination with a window-frame, and a cash mounted therein and provided with open-ended recesses in the opposite outer edges thereof, of a screen detachably connected to the ash, opposite catches carried by the screen, each catch being formed of a metal strap having one end secured to the screen, its intermediate portion being twisted to dispose its opposite ends at substantially right angles to each other, the outer end of the strap being provided with a lateral inwardly-directed catch-head to be received in the adjacent recess of the ash, and fastening devices carried by the opposite side rails of the ash and working in the respective recesses for engagement with the catch-head.

5. The combination with upper and lower window-cashes, of upper and lower screens connected thereto and movable therewith, spring-rollers for the respective screens, and means for interlocking the two screens when either cash is open.

6. The combination with upper and lower cashes, of upper and lower screens connected thereto, spring-rollers for the respective screens, and means for interlocking the two screens in differently-adjusted relations.

7. The combination with upper and lower window-cashes, of upper and lower screens connected to the respective cashes, spring-rollers for the screens, a plurality of keepers carried by the upper cash, and a spring-actuated belt carried by the lower cash and in operative relation to the keepers.

8. The combination with upper and lower window-cashes, of upper and lower screens connected thereto, spring-rollers for the screens, keepers carried by the upper cash, and a spring-actuated and rotatably-adjustable locking-belt working transversely through the lower cash and in operative relation to the keepers, the inner end of the belt being beveled.

9. The combination with upper and lower window-cashes, of upper and lower screens connected thereto, spring-rollers for the screens, a plurality of keepers carried by the upper cash, a tubular belt-casing transversely passing the lower cash, the inner end of the casing having diametrically opposite longitudinal slots and step projections at the outer end of the slots, an endwise-movable and rotatably-adjustable locking-belt working in the casing and having an enlarged beveled inner end co-operating with the keepers, the outer end of the belt having a head for engaging with the step projections, and a coiled spring embracing the belt and bearing in opposite directions against the outer end of the casing and the enlarged inner end of the belt.

10. The combination with a window-frame having a longitudinal slot in one end piece thereof, and a window-cash, of a screen working through the slot and connected to the ash, a roller located between the opposite sides of the frame at the outer side of the slotted end piece and having the screen connected thereto, opposite roller-journals mounted in and projected through openings in the respective sides of the frame, and a coiled spring embracing the projected end of one of the journals with its inner end connected thereto and its outer end connected to the window-frame.

11. The combination with a window-frame, and a cash, of a screen connected to the ash, a roller located within the frame and having the screen connected thereto, a journal projected through one side of the

frame and into the roller, the other end of the journal being projected beyond the side piece and provided with a longitudinal bifurcation, a coiled spring embracing the projected end of the journal with its inner end seated in the bifurcation and its outer end connected to the frame, a plate fitted to the outer end of the journal and covering the spring, and a key passing the journal to hold the plate in place.

12. The combination with a window-frame, of a screen, a roller located within the frame and having the screen connected thereto, a journal carried by the roller and projected through the adjacent side of the window-frame, a coiled spring embracing the projected end of the journal with its inner end connected thereto and its outer end connected to the window-frame, a plate fitted to the outer end of the journal and covering the outer edges of the bifurcations of the spring, and a device carried by the outer end of the journal to hold the plate in place thereon.

13. The combination with a window-frame having a longitudinal slot formed in one end piece thereof, of a cash working in the frame, a screen working through the slot, opposite catches secured to the screen and projected outwardly beyond the frame, the inner ends of the catches being provided with lateral step projections for engagement with the slotted end piece of the frame to prevent the screen from passing entirely through the slot thereof, and locking devices carried by the ash in operative relation to the catches.

702,078. GOLF-TEE. CHARLES E. STUCKER, JR., Meriden, Conn. Filed Nov. 22, 1901. Serial No. 22,222. (No model.)

Claim.—A portable golf-tee consisting of a truncated cone formed from finely-powdered substance combined with a soluble binder, said substance and binder molded and hardened and adapted to be readily disintegrated by moisture or pressure, substantially as described.

702,079. PIPE-WRENCH. GEORGE E. SWANSON, Phoenixville, Cal., assignor of one-half to MARCELLUS L. SMITH, Phoenixville, Cal. Filed Nov. 12, 1901. Serial No. 22,122. (No model.)

Claim.—1. A pipe-wrench consisting of a handle, a chain pivoted near one end of said handle, a member longitudinally movable upon the handle and to which the chain is pivoted, said chain having a link or member adjacent to the pivot-point of sufficient width to admit the passage of the chain therethrough, whereby the chain may be able to encircle a pipe completely, and a projection upon the handle with which the free end of the chain may be engaged.

2. The combination is a pipe-wrench of a handle, a member slidable longitudinally upon said handle, a chain pivoted to said slidable member, and means upon the end of the handle by which a link of the chain may be engaged.

3. The combination is a pipe-wrench of a handle, a member slidable longitudinally upon said handle, a chain pivoted to said member and freely turnable across the end of the handle, a chain secured to said chain and adapted to be passed therethrough to encircle a pipe completely, and a means upon the handle by which a link of said chain may be engaged.

4. The combination is a wrench of a handle, a cleave movable lon-

gitudinally thereon, a flexible gripping member pivoted to said cleave and movable therewith, and means upon said handle whereby the free end of the gripping member may be engaged.

5. The combination is a wrench of a handle, a cleave pivoted to said handle and adjustable longitudinally thereon, a flexible gripping member secured to said cleave and adapted to pass through said cleave to encircle a pipe completely, and means upon the handle whereby said grip member as passed through the cleave may be engaged.

6. The combination is a pipe-wrench of a handle, a cleave movable longitudinally upon said handle, a chain pivoted to said cleave, a slot in the handle in which the pivot of said cleave is slidable, a chain secured to and adapted to be passed through said cleave so as to completely encircle a pipe and a projection upon the handle with which a link of the chain may be engaged.

702,080. STORE-SERVICE APPARATUS. MORRIS C. SWIFT, West Haven, Conn. Filed Apr. 1, 1900. Serial No. 100,901. (No model.)

Claim.—1. A store-service apparatus, a track-wire having near its termination an enlargement formed by a coiled spring, said coil tapering at opposite ends, the forward end rigidly secured to the track, and a bumper secured to the opposite end of the coil which is permitted to move longitudinally upon the wire substantially as described.

2. A store-service apparatus, a track-wire having near its termination an enlargement formed by a coiled spring, said coil tapering at opposite ends, the forward end rigidly secured to the track, a bumper secured to the opposite end of the coil which is permitted to move longitudinally upon the wire, and a cone tapering at opposite ends arranged within the coil, substantially as described.

3. A store-service apparatus, a track-wire having near its termination an enlargement formed by a coiled spring, said coil tapering at opposite ends, the forward end rigidly secured to the track, a bumper secured to the opposite end of the coil which is permitted to move longitudinally upon the wire, and a cone arranged within the coil, substantially as described.

702,081. MANUFACTURE OF GLASS BY ELECTRICAL HEATING. AUGUST VOLKMER, Muenchen, Germany. Filed Sept. 27, 1900. Serial No. 21,212. (Specimen.)

Claim.—An improvement in the manufacture of glass by electrical heating, consisting in intimately mixing the ground raw materials with a conducting material and melting the mixture by forming it into a part of a circuit carrying an electric current, substantially as described.

702,082. BUCKLE. DAVID E. WHITE, Winchester, Mass. Filed May 11, 1901. Serial No. 22,027. (No model.)

Claim.—1. In a buckle, the combination with a frame having an in-

termediate cross-bar, of a tongue hinged to said cross-bar and having its free end adapted to rest upon one of the end bars, and a tongue-shield comprising a metal plate having one end formed into a tubular offset which pivotally embraces the end bar against which a tongue is adapted to rest, and a flexible strap applied to the plate and adapted to be inserted beneath the other end bar of the frame to hold the shield entirely over the tongue, the opposite sides of the plate being folded over and engaged with the strap to hold the same to the tongue.

2. In a buckle, the combination with a frame having an intermediate cross-bar, of a tongue hinged to said cross-bar and having its free end adapted to rest upon one of the end bars, and a shield hinged to said end bar and having a flexible strap secured to its free end and adapted to be inserted beneath the other end bar, so as to hold the shield entirely over the tongue.

702,083. MEASURING-CASE. ALFRED E. WOODWARD and RALPH S. WOODWARD, Portland, Me. Filed Nov. 4, 1901. Serial No. 21,122. (No model.)

Claim.—1. In an article of the class described, in combination, an outer casing having an opening in one end and near the bottom thereof, a removable inner casing having an inclined bottom and opening therein, a drawer, one portion thereof being solid, the other portion being open for the reception of a removable measuring-receptacle, said inner casing adapted to rest upon the upper surface of said drawer.

2. In an article of the class described, in combination, a plurality of cases, one fitting within the other, the inner case having an inclined bottom and an opening therein, a drawer consisting of a closed and an open portion, the open portion carrying a removable measuring device with a plurality of divisions, said drawer moving in an opening in the outer casing and underneath the inner case, said inner case resting lightly on said drawer and steps on the under side of said inner casing and on the upper side of said drawer and at the rear thereof to limit the forward movement of said drawer.

3. In a device of the class described, in combination, an outer casing having an opening in the end and near the bottom, an inner casing removably mounted in said outer casing and provided with an inclined bottom and an opening therein, a sliding member consisting of closed and open portions, the open portion carrying a removable receptacle consisting of various-sized measuring devices, the inner casing adapted to rest lightly on said sliding member, the solid portion of said sliding member adapted to close the opening in the bottom of the inner casing when said member is in extended position and the measuring-receptacle to be in registry with the opening in said inner casing when said member is in its closed position.

702,084. SYSTEM FOR CONTINUOUS HEATING AND METAL-ROLLING. THOMAS V. ALLEN, Bridgeport, Conn., assignor, by mesne assignments, to the International Tin Plate Corporation, a Corporation of New Jersey. Filed Feb. 1, 1901. Renewed Apr. 22, 1900. Serial No. 21,121. (No model.)

Claim.—1. The herein-described system for continuous heating and metal-rolling, which consists of one or more furnaces mounted on a section of track running at right angles to the feeding-line of a rolling-mill situated in close proximity to said furnaces, means for reciprocally propelling said furnace; a flexible tube for conveying fuel-gas to said furnaces connected therewith and to a winding-drum and communicating

with an interior gas-chamber in said drum, and a gas-supply pipe communicating with said chamber, for the purpose set forth.

2. The combination, with the system herein shown and described, of a rotating drum, a gas-chamber in said drum, means whereby gas is supplied to said chamber, a flexible gas-delivery tube communicating with said chamber and the furnace, and an operating-cable connected to said drum, with means adapted to rotate the drum and wind up the flexible gas-delivery tube when the furnace are moving in one direction, and to unwind said flexible tube when the furnace are moving in the opposite direction, for the purpose set forth.

702,085. FOLDING-MACHINE. LEWIS E. BARNER, Methuen, Mass. Filed Feb. 1, 1902. Serial No. 88,100. (No model.)

Claim.—1. The herein-described sample-cloth-folding machine, consisting in combination with a pair of rotary creasing-rollers, of a work-supporting table, a carrier adjustable on the latter relative to the rollers, said carrier being pivotally connected to the carrier and a former-plate K, substantially as and for the purpose set forth.

2. The cloth-folding device, as described, consisting of a longitudinally-movable carrier G, combined with folders I, I, pivotally connected to said carrier and a detachable former-plate K, adapted to be placed on the top of the sample-cloth before closing the binged folders substantially as and for the purpose set forth.

3. In a sample-cloth-folding machine, in combination a pair of rotary creasing-rollers, a longitudinally-movable carrier, a pair of folders binged to said carrier, a detachable former-plate adapted to be placed on top of the cloth previous to closing said folders and a stop device for limiting the motion of the carrier and its former-plate relative to the creasing-rollers substantially as and for the purpose set forth.

4. A cloth-folding machine, consisting in combination a pair of rotary creasing-rollers, a reciprocating carrier, binged folders on the latter, a detachable former-plate and stop device for limiting the forward motion of the carrier and former-plate substantially as and for the purpose set forth.

702,086. GRAVITY-MOTOR. WILLIAM S. BARNES, Lehigh, Pa. Filed June 23, 1901. Serial No. 64,466. (No model.)

Claim.—1. A device of the class described comprising a potential device including a winding-drum, a drive-shaft operatively connected with the drum, a governor for the potential device operatively connected with the drum and means for actuating the governor manually to stop and release the mechanism.

2. A device of the class described comprising a potential device including a winding-drum, a drive-shaft operatively connected with the drum, a governor for the potential device including an automatically-shiftable brake member, a brake-disc in the path of movement of the shiftable member, and means for manually moving the disc into and out of engagement with the shiftable member to stop and release the mechanism.

702,087. INSULATING HANDLE CONNECTION. GEORGE B. BARNES, Taunton, Mass. Assignor to Reed and Burton Corporation, Taunton, Mass. Filed Sept. 12, 1901. Serial No. 73,172. (No model.)

Claim.—1. A handle connection comprising a tubular fitting, designed to be secured to a vessel, a non-conducting piece, a plate, and a staple, the legs of the staple extending through the plate and insulating piece and secured within the tubular fitting by molten metal, substantially as described.

2. A handle connection consisting of an insulator, a plate, a tubular fitting and a staple, the legs of the staple being passed through the plate and the insulator and the terminal ends of said legs being clamped within the tubular fitting and secured in place by molten metal, the fitting secured to a vessel and a handle connected to the plate, substantially as described.

702,088. GAME-TABLE. PERLEY W. CANNON, New Haven, Conn. Filed Feb. 14, 1902. Serial No. 94,674. (No model.)

Claim.—1. In a game-table, the combination with the frame thereof, of stationary pockets within the frame and projecting beyond its feet, and a tail-board hinged to the base of said pockets and adapted to be turned up to close the outer ends of the pockets substantially as described.

2. In a game-table, the combination with the frame thereof, inclined from its top to its feet, and having stationary pockets within the frame and projecting beyond its feet, of a tail-board hinged to the base of said pockets and adapted to be turned up to close the outer ends of the pockets, guides on said frame inclined toward said pockets, and a game-table resting on said frame and formed with openings through it between said guides, substantially as described.

702,089. DETACHABLE FASTENER FOR WINDOW-SHUTTERS. ARTHUR L. BARR, Carroll, Iowa. Assignor to Winfield A. Barr and Harry R. Barr, Carroll, Iowa. Filed Mar. 2, 1902. Serial No. 87,280. (No model.)

Claim.—A fastening device consisting of a bracket adapted to be fixed to a window-frame to project outward and provided with an open slot to admit a link and a lever having an eccentric at one end pivoted to one end of a link and a link pivotally connected with the eccentric end of the lever and adapted to be pivotally connected with a window-shutter, for the purpose stated.

702,090. INLET-VALVE-GOVERNING MECHANISM FOR ENGINES. JAMES F. DUNN, Springfield, Mass. Filed Dec. 27, 1900. Serial No. 41,303. (No model.)

Claim.—1. In an engine, the combination, with a valve-limiting rod; of a casing having the chamber, m; the plunger, h, operated by the engine; the inlet-valve, c; the casing having also the chamber, p, and a passage connecting the chamber, m, and p; the check-valve, q, in said inlet passage; the piston, r, working in chamber, p, and actuated by the pressure generated by said plunger, h; the return-spring, t, the chamber, p, having the outlet, o, at its extremity and; the adjustment-valve, u, in said outlet; the piston-rod, s; and means for causing said rod to operate said valve-limiting rod, substantially as set forth.

2. The combination, with a cylinder, a valve and valve-stem therefor, of movable means for limiting the movement of the valve-stem, means connected with the cylinder for guiding said limiting means during its movement, and means for adjusting the position of said guiding means so as to vary the amount of said limitation caused by said limiting means in its several positions.

3. The combination of a cylinder, a valve and valve-stem therefor, the valve-stem projecting out of the cylinder and having an abutment on its free end, and a movable bar having a slot therein and being so arranged that the valve-stem moves through its slot, the bar having a cam-face arranged to engage said abutment and thereby limit its movement.

4. The combination of a cylinder, a valve and valve-stem therefor, the valve-stem projecting out of the cylinder and having an abutment on its free end, a bushing connected with the cylinder and through which the valve-stem reciprocates, the bushing having an annular groove, and a movable bar having a slot therein and having the margin of said slot arranged to engage said bushing at its groove, the bushing being adjustable on the cylinder in an axial direction, said bar having a cam-face so

arranged to engage said abutment and thereby limit the movement of the valve.

5. The combination of a cylinder, a valve and valve-stem therefor, the valve-stem projecting out of the cylinder and having an abutment on its free end, a bushing connected with the cylinder and through which the valve-stem reciprocates, the bushing having an annular groove, a movable bar having a slot therein and having the margin of said slot arranged to engage said bushing at its groove, the bushing being adjustable on the cylinder in an axial direction, said bar having a cam-face arranged to engage said abutment and thereby limit the movement of the valve, an air-pump operated by the engine, a cylinder containing a piston that is operated by pressure from said air-pump, and a lever connecting said latter piston with said cam-face bar.

6. The combination of a cylinder, a valve and valve-stem therefor, the valve-stem projecting out of the cylinder and having an abutment on its free end, a cam-rod in the said cylinder having a lever engaging said valve-stem, a bushing threaded into said plug and through which the valve-stem reciprocates, the bushing having an annular groove, and a movable bar having a slot therein and having the margin, said slot arranged to engage said bushing at its groove, the bushing being adjustable on the cylinder in an axial direction, said bar having a cam-face arranged to engage said abutment and thereby limit the movement of the valve.

7. The combination, with a pair of cylinders each having a valve and stem therefor, said stems being arranged parallel, of a bar movable transversely to the valve-stems and having means for simultaneously limiting the movement of the valve-stems, a means connected with each cylinder for guiding its said limiting means during said movement, and means on each cylinder for adjusting the position of said guiding means so as to vary the amount of said limiting means in its several positions.

702,091. STAPLE FORMING AND DRIVING MECHANISM. WILLIAM BARR, Brooklyn, N. Y. Assignor to Alfred E. Benjamin, New York, N. Y. Filed Aug. 31, 1901. Serial No. 74,068. (No model.)

Claim.—1. In combination the base-plate having a track or way therein containing a female former having a sliding motion, a channel in said female former, in which the staple is formed, a stationary guide containing a corresponding channel, means for holding the female former and guide together while the staple is being driven and a male staple former and guide guided upon said base-plate, substantially as described.

2. In staple forming and driving mechanism, the male staple former and driver comprising a pivoted lever having a notched tongue at one end thereof, said notch being formed in the front end of the said tongue, the rear edge of the said tongue being adapted to engage the wire for forming the staple, substantially as described.

2. In staple forming and driving mechanism, the combination of a base-plate, a female former and guide upon said base-plate, each having a longitudinal channel, a retractile spring normally holding the former and guide together so that the slot is then continuous from one part to the other, a frame carrying a pivoted male former mounted on said base-plate, and means for tripping the male former when it has reached a predetermined point in its travel in the slot, substantially as described.

4. In combination the base-plate, a guide rigidly secured to the base-plate and having a longitudinal channel, a female former having a limited sliding motion and also having a longitudinal channel, a male staple former and driver guided in said channel, and means for tripping said male former and driver and lifting it clear of the staple which has been formed and is laid in the channel, substantially as described.

5. The combination of the base-plate, a continuous channel, one section of said channel being contained in a guide rigidly held on the plate and the other section being in a female former having a sliding motion therein, a spring for drawing the female former forward, an opening at the meeting-point of the former and guide for admitting the wire, a male staple former and driver moving in said channel, and means for tripping said male former and driver and lifting it clear of the staple when a staple has been formed therefrom, substantially as described.

6. In a staple forming and driving device a frame carrying a pivoted male former, said male former being provided with a notched tongue at its forward end and a trip near its rear end, a base-plate upon which the frame is mounted, carrying a channel in which the tongue travels and a tripping device for lifting said tongue out of the channel when the trip strikes the tripping device, said male former being pivoted intermediate of its length, substantially as described.

7. The combination of the base-plate, a guide-rod mounted thereon, a former-bar-carrying frame comprising a sleeve and a casing carrying a pivoted male former, a channel composed of two sections in which a tongue upon the forward end of the male former travels, a tripping device carried by the base-plate and a trip near the rear end of the male former for striking said tripping device and lifting the tongue clear of the channel when a staple has been formed therefrom, substantially as described.

8. The combination of a base-plate, a guide-rod mounted thereon, a former-bar-carrying frame suitably mounted on said rod, said former-bar comprising a male former pivoted in the frame, and means for tripping said male former comprising a trip on the rear end of said male former and a spring-actuated pin mounted in a lug projecting upwardly from the base-plate, against which said trip strikes, substantially as described.

9. In combination, a stationary channelled guide, a movable female former arranged in line therewith and channelled to conform thereto, means for feeding the wire transversely of said channel, a male former and driver moving in said channel in the female former and guide, and means for lifting said male former and driver on its backward stroke to discharge it from the staple and allow it to drop into driving position behind the staple, substantially as described.

10. In combination, a stationary channelled guide for the wire and male former, a female former arranged in line with the guide and channelled to conform thereto, said female former being longitudinally movable in relation to the guide, and a male former and driver combined working within said female former and guide, substantially as described.

11. In combination, a channelled guide for the staple, a male former, a female former in which the male former works, said female former being channelled to provide a continuation of the channel in the guide and being movable away from the channelled guide in the forming operation, and means for returning the female former to normal position against the channelled guide, substantially as described.

12. In combination, a channelled guide for the staple, a male former, a female former in which the male former works, said female former being movable in relation to the channelled guide to separate therefrom in the formation of the staple, and means for returning the female former to normal position, the said male former serving also as a driver, substantially as described.

702,092. ACETYLENE-GAS APPARATUS. ARTHUR W. BOWMAN, Sacramento, Cal. Filed Sept. 20, 1901. Serial No. 78,711. (No model.)

Claim.—1. An acetylene-gas machine, comprising in combination a generator, a generator including a water-containing receptacle and a bell adapted to fit within the latter, seating-passages between the generator and generator, a carbide-containing chamber in the upper part of said generator-bell, a discharge-opening in said chamber, a valve opening outwardly and downwardly and adapted to control said opening, means including a spring-pressed stem extending through the top of said bell whereby said valve is normally closed against said opening, and a lever of the second class on the outside of the generator-bell and connected with the bell of the generator, by means of which lever said valve is made to open and close by the rise and fall of the bell.

2. In an acetylene-gas machine, the combination with a generator composed of separable, telescoping cylinders, water supply and discharge openings in said generator, a carbide-chamber in the top of said generator, a discharge-opening in the bottom of said chamber, a valve exterior to the chamber and fitting said opening, the stem of said valve extending through said chamber to the exterior of the generator, means including a tube extending above and below the top of the generator and an inverted cup within said tube and extending above the same said means forming a water seal about said stem to prevent the escape of gas from the generator, a spring by which the valve is normally kept closed, and a lever bearing upon the cup whereby said valve may be opened to admit carbide to the generator-chamber.

3. In an acetylene-gas machine, the combination with a generator, of a carbide-chamber therein, a discharge-opening in the bottom of said chamber, a valve seating in said opening exterior to the chamber, a valve-stem, a tubular guide for said stem, said guide closed at both ends and extending above and below the top of the generator-casing, means including a tube and an inverted cup both extending above and below the top of the generator-casing and forming a seal whereby gas may not escape through said guide, and a spring bearing upon the end of said guide and against the end of the stem whereby the valve is held in a normally closed position.

4. In an acetylene-gas machine, the combination with a generator, of a carbide-chamber, a discharge-aperture therein, cone-shaped valve-seating therein and adapted to open outwardly into the generator-chamber, a conical flange or hood upon said carbide-chamber and isolating said valve, a stem on said valve, said stem extending upwardly through said carbide-chamber, a closed tubular guide for said stem, a fixed cylinder isolating said guide, and extending above and below the top of the generator-casing, a means by which a seal with said cylinder may be formed to prevent the escape of gas around said stem, a spring by which said valve is made normally to seat, and a lever mechanism whereby said valve may be operated.

5. An acetylene-gas machine consisting in combination of a generator, a generator, water supply and discharge openings, a carbide-chamber in said generator, a discharge-aperture in said chamber, a conical hood or flange surrounding said aperture, a valve seating in the latter and adapted to discharge the carbide radially within the generator-chamber, a stem for said valve, a tubular guide in which said stem is slidable, a spring by which said valve is normally held in closed position, a fixed cylinder upon at its outer end extending into the carbide-chamber, and through which said guide passes, a second cylinder slidable within said fixed cylinder, and adapted to form a water or like seal therewith, said slidable cylinder including and supported by said stem, and both cylinders and the guide extending above and below the top of the generator-casing and a lever of the second class hinged upon the generator and adapted to bear upon the top of the slidable cylinder to operate the above-mentioned valve in relation to the rise and fall of the generator-bell.

702,093. FIREPROOF BUILDING STRUCTURE. JULIAN C. BULLOCK, Baltimore, Md. Filed Sept. 20, 1901. Serial No. 77,093. (No model.)

Claim.—1. The combination with one or more supports of a building structure thereon consisting of a body of cemented material and a framework of metal rods embedded therein, said framework comprising

a series of parallel tension-rods extending longitudinally throughout the lower part of the structure and a separate series of short suspension-rods for each support, each series of suspension-rods extending through the upper part of the structure over a support and thence downwardly in the lower part of the structure and terminating on either side of the support.

2. The combination with one or more supports of a building structure thereon consisting of a body of cemented material and a framework of metal rods embedded therein, said framework comprising a series of parallel tension-rods extending longitudinally throughout the lower part of the structure, a separate series of longitudinal brace-rods between each pair of supports in the lower part of the structure, and a separate series of short suspension-rods for each support, each series of suspension-rods extending through the upper part of the structure over a support and thence downwardly into the lower part of the structure on each side of the support and terminating adjacent to the ends of the brace-rods.

3. The combination with one or more supports of a building structure thereon consisting of a body of cemented material and a framework of metal rods embedded therein, said framework comprising a series of parallel tension-rods extending longitudinally throughout the lower part of the structure, a separate series of longitudinal brace-rods extending between each pair of supports in the lower part of the structure, a separate series of short suspension-rods for each support, each series of suspension-rods extending through the upper part of the structure over a support and thence downwardly into the lower part of the structure on each side of the support and terminating near the ends of the brace-rods, and stirrups extending beneath said rods and upwardly into the mass of cemented material.

702,094. ADJUSTABLE WINDOW-SCREEN. EDWIN E. FLEMING, Hingham, Mass. Filed July 15, 1901. Serial No. 80,779. (No model.)

Claim.—1. A window-screen, comprising substantially duplicate overlapping frame-sections, wire screens secured to the adjacent faces of the respective frame-sections, and screen-strips secured to the inner faces of the outer ends of the respective frame-sections and covering the outer marginal edges of the respective screens, the inner faces of the opposite longitudinal sides of one frame-section being provided with longitudinal dovetailed grooves which open through the inner end of the section, and the inner faces of the opposite longitudinal sides of the other frame-section having integral longitudinal dovetailed tongues slidably mounted in the respective grooves of the first-mentioned frame-section.

2. A window-screen comprising opposite substantially rectangular duplicate overlapping frame-sections, wire screens secured to the adjacent faces of the frame-sections, and metallic U-shaped strips embracing the outer free edges of the respective wire screens to form the inner ends of the frame-sections, and folded over therewith against the inner faces thereof and lying in frictional engagement with the screens of the respective other section, whereby the folded-over portions of the strips travel in the same plane and form stops for mutual engagement to limit outward movements of the frame-sections, and also form closures for the space between the overlapped portions of the sections, the opposite ends of the strips being fastened to the opposite sides of the respective frame-sections.

3. A window-screen, comprising opposite substantially duplicate screen-sections, each of which has a three-sided frame, a wire-screen portion secured to the inner side of the frame, and a screen-strip secured to the inner side of the end of the frame and covering the outer marginal edge of the screen portion, the inner faces of the opposite longitudinal sides of one frame being provided with longitudinal dovetailed grooves which open through the inner end of the frame, the inner faces of the opposite longitudinal sides of the other frame having integral longitudinal dovetailed tongues slidably mounted in the respective grooves, and substantially U-shaped metallic edge strips embracing the inner and outer edges of the respective wire-screen portions and folded over therewith flat against the inner sides of said screens to form laterally offset stop-strips lying upon the inner sides of the respective screen portions and in frictional engagement with the respective opposite screen-sections.

702,095. ELEVATOR-GUARD. RALPH I. FURBER, Espokane, Wash. Filed Dec. 15, 1900. Serial No. 60,500. (No model.)

Claim.—The combination with the floor D, the depending plate 5 rigidly secured to said floor at the entrance portion thereof, the plate 6 hinged to said plate 5, the hinges 7 and 8, the spring 9 mounted on the spindle of said hinges and tending to swing the plate 6 into alignment with the plate 5, and the stud 10 secured to the lower portion of the plate 6 and furnished with the above 11, of the cam or way 12 positioned to interrupt the above 11 and direct the same out of its vertical path, as and for the purpose described.

702,096. MACHINE FOR UNLOADING CANE-CARR. HENRY FROELICH, Lima, Peru. Filed Oct. 22, 1901. Serial No. 79,500. (No model.)

Claim.—1. In a cane-unloader, the combination of a pivoted frame, an endless toothed carrier traveling on said frame, means permitting the frame and carrier to descend as the unloading proceeds, and means for automatically discontinuing the descent at a predetermined point.

2. In a cane-unloader, the combination of a pivoted frame, an endless toothed carrier traveling on said frame, an operating-shaft for the carrier, a winding-drum having a flexible connection with the frame, means operated by the carrier-shaft for turning the drum to lower the frame, and an automatic device to discontinue the rotation of the drum at a predetermined point.

3. In a cane-unloader, the combination of a pivoted frame carrying an endless toothed carrier, a shaft A for operating the carrier, a shaft B having a winding-drum, a flexible connection C from the drum to the frame, a shaft D, a pawl-and-ratchet mechanism operated thereby to re-

wind the drum and allow the carrier-frame to descend, a weight *W* carried by the connection *g*, and a trip *f* adapted to be struck by the weight and disengage the unwinding of the drum at a predetermined time.

702,097. SHOVEL. JAMES F. HAYLAND, Paterson, N. J. Filed Mar. 27, 1902. Serial No. 100,174. (No model.)

Claim.—1. An auxiliary handle, adapted to be pivotally secured to the handle-bar of a shovel, near the blade, and provided with a U-shaped stop-yoke depending therefrom and passing down and under the handle-bar, substantially as set forth.

2. An auxiliary handle, adapted to be secured pivotally above the handle-bar proper of a shovel, and a U-shaped yoke rigidly secured to and depending from the side of said handle, above the point of pivotal connection, and passing down under said handle-bar to form a support therefor, and means for locking said U-shaped yoke at various points to such a handle-bar, substantially as set forth.

3. In a shovel, a handle-bar and blade, in combination with an auxiliary handle above said handle-bar and pivotally secured thereto, near the blade, and a U-shaped yoke having openings in the side thereof, rigidly secured to and depending from the side of said handle above the point of pivotal connection and passing down under the handle-bar, an opening passing laterally through the handle-bar and a pin adapted to pass through said opening and the openings in the side of the U-shaped yoke to lock the handle-bar, rigidly when required, in a desired position in said yoke, substantially as set forth.

4. In a shovel, the combination with the handle-bar thereof, of an auxiliary handle, adapted to be secured rigidly, or pivotally, thereto, and means for locking said auxiliary handle at various angles in relation to the handle-bar, substantially as set forth.

702,098. AUTOMATIC CLAMBER-MACHINE. EDWARD C. HARRIS, New Haven, Conn. Filed July 10, 1901. Serial No. 67,704. (No model.)

Claim.—1. In a machine of the character described, comprising, in combination with a polishing-wheel, an oscillating frame, adapted to be automatically operated, a support therefor, an automatically-reciprocating knife-supporting slide mounted on said head, means for gradually elevating the knife-carrying end of said frame while the reciprocating knife-support is in action, for the purpose set forth.

2. The combination, in a machine of the character described, of a reciprocating knife-support, a supporting-head therefor, on which said

knife-support is adapted to reciprocate, means for gradually elevating said head while the knife-support is in action, for the purpose set forth.

3. In a machine of the character described, comprising, in combination, with a polishing-wheel, a pivotally-supported frame carrying a fixed head at its free end, an automatically-operating knife-supporting slide mounted on said head, said frame adapted to have an oscillating movement through the medium of an automatically-operating cam adjacent thereto, means whereby the machine is brought to a standstill when the polishing is completed with the head at or near its highest point so as to leave the head of said frame in an elevated position for a readjustment of the work.

4. The combination, in a machine of the character described, adapted to be used in connection with a polishing-wheel, of an oscillating frame carrying a reciprocating knife-support, means whereby an adjustable spring tension is maintained between said knife-support and the polishing-wheel, a cam adapted to elevate the knife-carrying end of said frame during the reciprocal action of said knife-support, means for automatically stopping the machine when the polishing operation is completed, for the purpose set forth.

5. The combination, in a machine of the character described, adapted to be used in connection with a polishing-wheel, of an oscillating frame carrying a reciprocating knife-support, means for supporting a knife thereon so that both sides thereof may be finished, means whereby an adjustable spring tension is maintained between said knife-support and the polishing-wheel, a cam for gradually elevating the knife-carrying end of said frame during the reciprocal action of said knife-support, means for rotating said cam, for the purpose set forth.

6. The combination, in a machine of the character described, of a reciprocating slide carrying a knife-support, a knife adapted to rest on one side of said support, the opposite side of said support cut away sufficient to form a yielding bed for the knife, for the purpose set forth.

702,099. MECHANICAL MOVEMENT. JOHN D. A. JENNINGS, Omaha, Neb., assignor to Richmond Cider Works, Harrodsburg, Va., a Corporation of Virginia. Filed Aug. 10, 1901. Serial No. 73,597. (No model.)

Claim.—1. In combination, a support, a driven shaft provided with a cylindrical portion having a row of pins or teeth radially arranged and extending part way around said cylindrical part, said cylindrical part being also provided in its periphery with an external groove extending around said row of pins, a drive-shaft and a stationary bearing therefor, said shaft being provided with a pin in constant mesh with the abutment row of pins and with a universal joint between its bearing and the pinion and having its inner end extending beyond said pinion and working in said groove, the bottom of the upper part of the groove serving as a bearing or rest to support the inner end of the shaft while the pinion is in engagement with the upper side of the pins or teeth, and an upright guide for the drive-shaft located between the pinion and the joint in the shaft as set forth for the purpose set forth.

2. In combination, a support, a driven shaft provided with a cylindrical portion having a row of pins or teeth radially arranged thereon

and extending part way around said cylindrical portion, bearings *b b* engaging the ends of said cylindrical enlargement and holding the driven shaft against endwise movement, a driving-shaft and a stationary bearing therefor, a pinion carried by said shaft and meshing with said pins or teeth, said shaft being jointed at a point between said pinion and said bearing and having its end projecting beyond the pinion, a slotted standard connecting the bearings *b b* through which said drive-shaft works, said standard being located between the pinion and the joint in the shaft, and guiding means whereby when said drive-shaft is rotated continuously in one direction said pinion will be caused to first engage the upper side of said row of pins or teeth and then the lower side thereof and so on alternately, said guiding means consisting of a groove in the cylindrical enlargement in which the projecting end of the shaft works and is supported.

702,100. ENVELOP. DAVID H. KRAMER, Louisville, Ky. Filed Jan. 4, 1902. Serial No. 83,382. (No model.)

Claim.—An envelop having at one end a line of perforations *2* extending parallel with the end of the envelop, the front and rear faces of the opposite end of the envelop being sealed together by an adhesive material *4* extending in a curved or inclined line toward the end of the open flap of said envelop and thereby acting as a guide to facilitate the entrance of the letter or other contents.

702,101. AXLE. BENJAMIN KLINE, Wheeling, Pa. Filed Oct. 14, 1901. Serial No. 73,386. (No model.)

Claim.—An axled axle having tangent transverse arms projecting laterally from the axled portion of the axle, and two parallel forwardly-projecting perforated caps on each arm, substantially as described.

702,102. CONNECTING-JOINT FOR MIDDYTHAM. JOHN R. MIDDYTHAM, San Francisco, Cal., assignor of one-half to W. A. Schmitt, San Francisco, Cal. Filed June 10, 1902. Serial No. 84,181. (No model.)

Claim.—1. A hinged joint and fastening including supports fixed upon the posts, having the end rolls of the hinged joint thereon, said supports having faces which are straight vertically and beveled transversely, from side to side; side rolls having heads cast upon them and having faces straight vertically and beveled transversely, and adapted to engage the corresponding faces of the first-named supports, both of said supports having an enlarged plate or extension extending parallel with their outer side and provided with transversely-beveled meeting edges, and one of said supports having a bolt to pass through a hole in the plate or extension of the other support, and a nut engaging the bolt to draw the beveled faces of the supports and extensions in close contact, substantially as described.

2. A hinged-joint connection consisting of supports into which the vertical posts and end rolls of the hinged joint are cast, side rolls having heads cast upon their ends, transversely-beveled meeting faces upon these heads and upon the post attachment, enlarged ornamental faces formed and exterior to the heads of the side rolls, and similar sections formed upon post-supports, said sections having transversely-beveled meeting edges, holes projecting from the post-supports through holes in the segments of the side-roll heads and nuts adapted to screw upon said bolts so as to draw the beveled or inclined meeting faces of the parts together.

702,103. BUILDING-TILE. EDWARD L. LATTIN, Schenectady, N. Y. Filed Jan. 22, 1902. Serial No. 80,867. (No model.)

Claim.—1. A hollow tile having its wall or walls increased in thickness near one edge to provide an inwardly-extending flange or lip reduced in thickness toward the center of the cavity of the tile.

2. A hollow tile having its wall or walls provided with an inwardly-extending flange or lip which is continuously reduced in thickness toward the center of the cavity of the tile, and of which the outer surface is flush with one of the bearing or supporting surfaces of the tile.

3. A hollow tile having its wall or walls provided, flush with one of the bearing or supporting surfaces of the tile, with an inwardly-extending flange, which is continuously reduced in thickness toward its inner edge, and with its inner surface disposed obliquely to the plane of the surface of the wall.

4. A hollow tile having its wall or walls provided near one edge with a reduced inwardly-extending flange or lip having an outer flat surface flush with the adjacent bearing or supporting surface of the tile, and having its inner surface disposed obliquely to the plane of the wall.

5. A hollow tile provided at one of its bearing or supporting surfaces with a flange extending inward from the wall of the tile, the upper and lower surfaces of the flange or web being arranged in intersecting planes.

6. A hollow tile provided adjacent to one of its bearing or supporting surfaces with a strengthening flange or lip extending inward from the wall, and also provided in one of its side walls with an exterior terminal counter-sink or recess.

702,104. OTHER-TOUCH. MYNELL LAWRENCE, Chester, Md. Filed Nov. 9, 1901. Serial No. 81,304. (No model.)

Claim.—1. In combination with the jaws or members of an other-touch, a spring to open the same, a depending trip element, connection between the latter and said members of the touch, to open the latter

against the tension of said spring, and means to act said trip element, substantially as described.

2. In combination with the jaws or members of an oyster-tong, a spring to open the same, a depending trip element disposed between said members, flexible connections between said trip element and said members, to hold the latter open against the tension of said spring, means to raise and lower the tongue, and a set screw, operated by said raising and lowering means, to act said trip element, substantially as described.

3. In combination with the jaws or members of an oyster-tong, a spring to open the same, a vertically-movable depending trip element, disposed between said members, flexible connections between said trip element and said members to hold the latter open against the tension of said spring, a nut, a set-screw therein, to act said trip element, and means to hoist and lower said tongue, said hoisting and lowering means being connected in said set-screw, and adapted to be used for rotating the latter, substantially as described.

4. In combination with the jaws or members of an oyster-tong, a spring to open the same, a vertically-movable depending trip element, disposed between said members, flexible connections between said trip element and said members to hold the latter open against the tension of said spring, a nut, a set-screw therein to act said trip element, and a pole connected to said set-screw, and adapted to be used for rotating the latter, substantially as described.

5. In combination with the members of an oyster-tong, a nut to which said members are pivotally connected, a spring to normally close said members, toggle-links, connecting said members, a trip element, carried by said toggle-links and depending therefrom, a set-screw, operating in the said nut, and coacting with said toggle-links and trip element, to open said members against the tension of said spring, and a pole to hoist and lower said tongue, said pole being connected to and adapted to be used for turning said screw, substantially as described.

702,105. CURD-CUTTER. JAMES LAMER, Drummondville, Canada, assignor to Louis Adolphe Rite, St. Germain de Grantham, Quebec, Canada. Filed Jan. 14, 1902. Serial No. 45,705. (No model.)

Claim.—1. In a curd-cutting device, in combination, an elongated vertically-extending post or standard; a platform fastened to the upper portion of said post, said platform having the bottom or strip 12; a curd-cutting mechanism mounted to reciprocate horizontally above said platform, said platform forming the bottom for said mechanism, the operating means for said mechanism being pivotally connected to said post and having a movement upwardly from and returning to a substantially horizontal position; and clamping means mounted on the lower portion of said post, said means extending forward and operating in opposition to said bottom or strip, to prevent lateral and vertical movement of the post, whereby the device may be removably clamped to the outer side of a vat, the rear end extending thereover and being unsupported.

2. A curd-cutter comprising a hopper; a slidable outer-frame disposed below the hopper and provided with a valve-plate; a fixed platform below said outer-frame, extenders carried by the outer-frame and disposed below the valve-plate, the outer-frame in rear of the extenders and

below the valve-plate being cut away at the sides, whereby the space in rear of the extenders is freely accessible; and means for reciprocating said outer-frame in a horizontal direction, substantially as described.

3. A curd-cutter comprising a post or standard; a hopper secured thereto; a platform secured to the post in spaced relation to the hopper and provided with a depending portion 16; a withdrawable outer-frame slidably fitted between the platform and the hopper and provided with a valve-plate 21 arranged to travel close to the depending portion 16, said outer-frame having open sides and an open rear end below said valve-plate; a lever fulcrumed on the post and having an arm; a ball having a permanent pivotal connection with the lever-arm and arranged to straddle the post and the outer-frame and provided at its free forked ends with notches 30; and stile or plate 31 on the outer-frame, whereby the end portions of the ball are loosely and detachably connected to the outer-frame and the latter may be easily withdrawn from operative relation to the hopper, substantially as described.

702,106. VENTILATED BOX. LEONARD D. LEWIS, Adams, E. Y. Filed Jan. 14, 1902. Serial No. 45,906. (No model.)

Claim.—1. A receptacle provided at one end with a transverse channel forming a wall effect from the end face of the receptacle and provided at intervals with perforations, substantially as described.

2. A receptacle provided at one end with transverse channels having peripheral openings communicating with the same, said channels forming wall effect from the end face of the receptacle and provided at intervals with perforations, substantially as described.

3. A receptacle provided at one end with rows of perforations and having pieces arranged between the rows and forming channels extending inward from the outer edges of the receptacle, substantially as described.

4. A receptacle having its ends formed of perforated channelled plates, and provided with internal flanges engaging said plates, said receptacle having peripheral openings communicating with said channels.

5. A receptacle having perforated channels formed in its opposite ends and provided with peripheral openings communicating with said channels, and an imperforate plate disposed over one of said channelled ends.

6. A receptacle having one end thereof provided with two rows of

perforations crossing each other at right angles, segments disposed between said intersecting rows of perforations, and forming channels, and an internal flange on said receptacle extending over said segments and provided with openings formed at its junctures with said receptacle, said openings communicating with said channels.

7. A receptacle having one end thereof composed of a plate having rows of perforations crossing each other at right angles, extenders disposed between said intersecting rows of perforations, and forming channels, and an imperforate plate disposed over said end and attached thereto, said receptacle having peripheral openings communicating with said channels.

8. A receptacle having the bottom thereof formed of a perforated channelled inner plate, extenders disposed on said plate between said channels, said receptacle having a flange extending inwardly and engaging said extenders, and an imperforate plate disposed over said parts and attached thereto, and a perforated channelled cover adapted to fit over said receptacle.

702,107. HOLDER FOR THEATRE OR TRANSPORTATION TICKETS. BENJAMIN Q. LORAIN, Omaha, Neb. Filed July 4, 1902. Serial No. 45,951. (No model.)

Claim.—A ticket-holder consisting of a blank having a flap adapted to be folded over but once and secured to the blank to form therewith a pocket at one corner thereof, the said blank being provided with a slot within the outline of that portion to which the flap is secured and being further provided with space to contain advertisements and other printed matter.

702,108. COMBINED FRAME AND REGISTER FOR POOL GAMING. GEORGE E. HANDELL, Hamilton, Canada. Filed Apr. 19, 1902. Serial No. 45,778. (No model.)

Claim.—1. In a gaming apparatus of the character specified, the combination with a suitable frame of a registering device carried by the frame and co-operating with ball-releasing devices on the frame adapted to actuate the registering device when the balls are released as set forth.

2. In an apparatus substantially as described, the combination with a frame having suitable ball-releasing devices, whereby the group of balls will be held within the frame, and a co-operating registering device carried by the frame and suitable controlling means intermediate the ball-releasing devices and said register adapted to operate said register when the balls are released as set forth.

3. The combination with a suitable frame having means to confine the group of balls within the same and a registering device carried by and co-operating with the frame and means to manually release the group of balls within the frame and operate the register as set forth.

4. The combination with a suitable frame adapted to surround a group of balls and shape said group as desired, of retaining devices carried by the frame adapted to hold the balls within the frame; registering mechanism operatively connected to the retaining devices whereby said registering device will be operated when the retaining devices are controlled to release the balls as and for the purpose set forth.

5. The combination with a ball rack or frame having one end removed, of a door pivoted to said open end and adapted to close the same; a registering mechanism attached to the frame and operatively connected to the door whereby when the door is opened the register will be operated and the balls released as and for the purpose set forth.

6. A triangle ball-rack, upper and lower flanges on the inner sides of the rack, an open side to the rack, a door hinged to said open side, a spiral spring connected to the door and to an upper flange to open the door, a casing on one side of the rack, a latch on the door to enter the casing, a push-bar, extending through the casing, bearings in the casing for the push-bar, a fulcrumed lever-hitch in the casing, a retaining-spring at the end of said lever, an arm on the push-bar to engage the lever and release the latch, substantially as described.

7. A ball rack or frame having an open side; a door hinged to said open side; a spring connected to the door adapted to hold it normally open; a catch and keeper for said door; a registering mechanism and a push-button having a bar operatively connected with said catch and keeper said with said registering mechanism whereby when the button is pushed the register will be operated and the door opened to release the balls, as and for the purpose set forth.

8. A ball rack or frame; one end of which is removed; a door hinged to said open end; inwardly-directed flanges carried by the frame and by the lower edge of said door; a registering mechanism attached to the frame and operatively connected with a door whereby when the door is opened the register will be operated and the balls released as substantially as specified and for the purpose set forth.

702,109. SHUT-OFF DEVICE FOR MOTORS. THOMAS D. HEALA, Springfield, Mass., assignor to Springfield Engine Shop Company, New York, N. Y., a Corporation of Maine. Filed July 31, 1902. Serial No. 45,922. (No model.)

Claim.—1. The combination of an engine of the "Corbin" type, with cam; arranged to throw out the grab-hooks, rods extending from the same to a device adapted to force said rods upwardly, an electrically-operated mechanism arranged to cause the rod-throwing device to act, suitable electrical conductors, one or more stations or switches, and a source of electrical energy, substantially as shown.

2. The combination of an engine provided with grab-hooks and cut-out cases adapted to throw said grab-hooks out of engagement, with a shut-off cylinder having a piston and piston-rod operatively connected with said cut-out cases, a conduit leading to a source of pressure, and an electrically-operated valve in said conduit, substantially as shown.

3. The combination of a reservoir, with a motor, shut-off mechanism comprising grab-hooks and cut-out cases adapted to throw said grab-hooks out of engagement, in operative connection with a cylinder and a piston therein, a conduit from said reservoir to said cylinder, a valve in said conduit, means to operate said valve, and a conduit from a source of pressure as steam, air, gas, or water, to the reservoir, substantially as shown.

4. The combination of a source of pressure-supply, with a reservoir, a conduit between the two, a cylinder having a piston and a piston-rod, a conduit from said reservoir to said cylinder, an electrically-controlled

valve in the last-mentioned conduit, grab-hooks for a motor, cut-out cone adapted to throw said grab-hooks out of engagement, and rod connections between said cut-out cone and said piston-rod, substantially as shown.

702,110. INSTRUMENT FOR INDICATING AND RECORDING THE SPEED OF VEHICLES. JOHN BUTT, Rochester, N. Y. Filed July 26, 1901. Serial No. 69,796. (No model.)

Claim.—In an instrument for indicating and recording the speed of vehicles, a centrifugal governor with means for attaching to vehicle and suitable gearing to operate it from a wheel of the vehicle, a slide on the governor-shaft operated by the governor, a quadrant or sector of a wheel connected to and moved by the slide, a piston geared to and driven by the quadrant, a pointer fixed to the piston-shaft and an index over which the pointer moves, a cam driven by gearing from the governor-shaft, a lever arranged to be operated by the cam in one direction and by a spring in the opposite direction, a needle at the free end of the lever, a piston having a slot for the entrance of the needle; in combination with a drum driven by a clock-movement and arranged to carry a ribbon against the piston, the lever and needle being arranged to perforate the ribbon with a straight line of holes, substantially as shown and described.

702,111. ARTIFICIAL TOOTH-CROWN. JAMES C. OSBORN, Louisville, N. C. Filed July 26, 1901. Serial No. 69,778. (No model.)

Claim.—1. An artificial tooth-crown having a longitudinal opening or cavity of square transverse contour, disposed with its greatest diameter extending from mesial to distal and from palatal to labial, and having a transverse opening piercing the palatal face of the tooth and intersecting the cavity.

2. The combination with an artificial tooth-crown having a longitudinal cavity and a transverse opening intersecting the cavity, of a crown-post extending into the cavity and having a reduced portion disposed opposite the transverse opening in the crown.

3. The combination with an artificial tooth-crown having a transverse angular longitudinal cavity and a transverse opening intersecting said cavity, of a crown-post corresponding in contour to the contour of the cavity and fitting therein to prevent the turning of the crown upon the post, and means preventing relative endwise movement of the crown and post.

4. The combination with an artificial tooth-crown provided with a longitudinal cavity having an angular transverse contour, and a transverse opening intersecting the cavity adjacent to its inner end, of a crown-post having a cross-sectional contour corresponding to the contour of the cavity and fitting therein, said post being provided with a reduced portion disposed opposite the transverse opening in the crown, and a filling surrounding the reduced portion of the post and extended into the transverse opening in the crown.

5. The combination with an artificial tooth-crown provided with a longitudinal cavity having a polygonal cross-sectional contour, and a transverse opening intersecting the cavity at its inner end, of a crown-post of polygonal cross-sectional contour fitted into the cavity in the crown and provided with a terminal head, and a filling extended under the head of the post and into the transverse opening in the crown.

6. The combination with an artificial tooth-crown having a longitudinal cavity of square cross-sectional contour, and a transverse opening intersecting the cavity adjacent to the inner end thereof, of a crown-post having a square and fitted into the cavity in the crown and provided with a reduced portion defining a head located at the end of the cavity, and a filling surrounding the reduced portion of the post below the head thereof and extended into the transverse opening in the crown, the greatest diameter of said post being disposed between the mesial and distal and between the palatal and labial walls of the crown, respectively.

7. The combination with an artificial tooth-crown provided with a

longitudinal cavity of angular cross-sectional contour, of an angular crown-post fitted into the cavity and provided with a terminal head, and a filling extended under the head of the post to prevent detachment of the crown.

8. As a new article of manufacture, an artificial crown having a longitudinal cavity of square cross-sectional contour, and a transverse opening intersecting the cavity, the angle or corner of said cavity being disposed opposite the mesial, distal, palatal and labial sides of the crown.

9. As a new article of manufacture, a crown-post having a cylindrical screw-threaded portion at one end, a round head at its opposite end, a rounded reduced neck immediately adjacent to the head, and an angular portion extending from the neck to the cylindrical screw-threaded portion of the post.

702,112. AUTOMATIC EXTENSION SHADE-BRACKET. ALBERT H. OGDEN, Portland, R. I., assignor of one-half to Ulysses Rasmus, Providence, R. I. Filed Feb. 3, 1902. Serial No. 69,310. (No model.)

Claim.—1. As a new article of manufacture, a shade-roller-supporting device consisting of supports, rods pivotedly mounted in said supports, dotted arms fixedly attached to said rods, shade-rollers mounted in said dotted arms and means for causing the same to rest snugly against a window-frame, substantially as described.

2. As a new article of manufacture, a shade-roller-supporting device consisting of supports, rods pivotedly mounted in said supports, dotted arms fixedly attached to the outer extremities of said rods, and retractile means intermediate the dotted arms and supports.

3. As a new article of manufacture, a shade-roller-supporting device consisting of supports, rods in axial alignment loosely pivotedly mounted in said supports, arms downwardly projecting from said rods and retractile means for holding said arms in contact with the window-frame.

4. As a new article of manufacture, a shade-roller-supporting device consisting of supports, rods in axial alignment loosely pivotedly mounted in said supports, arms downwardly projecting from said rods, shade-rollers mounted in the arms, and a spring intermediate said arms and supports for holding the arms in engagement with the shade-rollers.

5. As a new article of manufacture, a shade-roller-supporting device consisting of supports for pivotedly-mounted rods, supports above said rods for holding a curtain-rod, pivotal rods with downwardly-projecting arms, and one or more shade-rollers mounted in said arms.

6. As an improved article of manufacture a support for shade-rollers composed of a single piece of material with perforated parallel arms and a connecting portion bent to form a channel, and a support having a depending portion held in said channel, as set forth.

702,113. RAILWAY SWITCH. LAPATINE PALMER, Matthews, Pa. Filed May 2, 1901. Serial No. 69,679. (No model.)

Claim.—The combination, with cross-ties and main rails; of the switch-sections having their bases supported on the cross-ties and provided with upwardly-inclined lower sides conforming to the bases of the main rails, and formed with extensions beyond the track throat, the points having upwardly-inclined lower sides conforming to the bases of the switch-sections and supported thereon, and slide receiving the extensions of the webs of the switch-sections and providing extensions located beneath the tread of the switch-sections the horizontal arms having vertical plates,

bolts securing the extensions and the vertical plates together and the rods connecting the horizontal arms.

702,114. SEED-TUBE FOR GRAIN-DRILLS. JOHN W. FENNELL, New City, N. Y. Filed Nov. 6, 1901. Serial No. 61,367. (No model.)

Claim.—1. In a grain-drill seed-tube of the character described, the combination with a closely-coiled-wire tube, of a downwardly-projecting cleaning portion secured to its lower end, substantially as described.

2. In a grain-drill seed-tube of the character described, the combination with a closely-coiled-wire tube, of a downwardly-projecting cleaning and guiding portion secured to its lower end, substantially as described.

3. In a grain-drill seed-tube of the character described, the combination with a closely-coiled-wire upper portion, of an openly-coiled-wire lower portion made integral with the upper portion and adapted to clean itself and the seed and also to form a guide for itself in the boot, substantially as described.

702,115. CONVERTER. HANFORD G. SHAW, Baltimore, Md. Filed Nov. 7, 1901. Serial No. 61,692. (No model.)

Claim.—1. In a converter, a cylindrical section, a continuous spiral flange arranged upon the said cylindrical section, a series of short spiral flanges of greater inclination arranged in juxtaposition to the said continuous spiral flange, a cylindrical section telescopically covering the whole, doors and an exit registering with the said flanges, substantially as shown and described.

2. In a converter, a cylindrical section having a continuous spiral flange thereupon, a series of short spiral flanges of greater inclination arranged in juxtaposition to the first-mentioned flange, a cylindrical section adapted to enclose the first-mentioned cylindrical section and flanges, and being provided with doors registering with the upper ends of the short flanges and an exit registering with the lower end of the continuous flange, substantially as shown and described.

3. In a converter, a cylindrical section having a continuous spiral flange, a series of short spiral flanges arranged in juxtaposition to the said continuous flange, a cylindrical section adapted to telescopically cover the first-mentioned cylindrical section and flanges, the last-mentioned cylindrical section being provided with doors registering with the upper ends of the said short spiral flanges and an exit registering with the lower

end of the continuous spiral, and a deflector at the end of the continuous spiral flange, substantially as shown and for the purpose set forth.

702,116. FABRIC-COILING ATTACHMENT FOR LOOMS. PAUL SCHMIDT, Hildesheim, Germany. Filed Jan. 14, 1902. Serial No. 69,997. (No model.)

Claim.—1. A coiling attachment for looms consisting of a shaft carrying a coiling-blade, means for imparting a rocking movement to the shaft, and means for imparting an axially-reciprocating movement to the shaft, substantially as specified.

2. A coiling attachment for looms consisting of a shaft carrying a coiling-blade, a cam fitted upon the shaft, a pin engaging the cam, a power-pulley, and means for imparting an axially-reciprocating movement from said pulley to the shaft, substantially as specified.

3. A coiling attachment for looms consisting of a shaft carrying a coiling-blade, a cam fitted upon the shaft, a pin engaging the cam, a power-pulley having a cam-groove, a lever engaging the cam, a rock-shaft connected to the lever, and means for operatively connecting the rock-shaft with the shaft, substantially as specified.

702,117. ART OF PRODUCING CHEMICALS IN ELECTRIC FUEL. HAGER, EDWARD R. TAYLOR, Penn Yan, N. Y. Filed Oct. 6, 1900. Re-noved Nov. 12, 1901. Serial No. 62,699. (No specimens.)

Claim.—1. The method of producing chemicals in an electric furnace which consists in introducing a charge into the furnace, passing a suitable electric current through the charge by means of relatively permanent electrodes, continuously feeding upon each electrode and between the same and the charge fragmentary conducting material, and regulating the electric current by means of such fragmentary material.

3. The method of producing chemicals in an electric furnace which consists in introducing the ingredients of a charge into the furnace, the less fusible ingredient being introduced from above, passing a suitable electric current through the charge by means of relatively permanent electrodes, continuously feeding upon each electrode and between the same said less fusible ingredient fragmentary conducting material, and regulating the electric current by means of said fragmentary material.

5. The method of producing chemicals in an electric furnace which consists in introducing a charge into the furnace, passing a suitable electric current through the charge by means of relatively permanent electrodes and their conductors, lining in contact with each conductor fusible material on its way to the interior of the furnace, and thereby cooling each conductor.

4. The method of producing chemicals in an electric furnace which consists in introducing a charge into the working chamber, passing a suitable electric current through the charge by means of relatively permanent electrodes and their conductors, lining upon the conductors a metal-lead on its way to said chamber, and thereby cooling said conductors.

5. Is the art of producing chemicals in electric furnaces, the improvement which consists in lining in contact with the electric conductors streams of fusible material in crushed condition on its way to the interior of the furnace, and thereby cooling said conductors.

6. The method of producing chemicals in an electric furnace, which consists in gradually melting fusible material for a given reaction outside the wall of the working chamber by heat of the furnace that would otherwise be lost by radiation, and then vaporizing the same and combining it with less fusible material within each working chamber.

4. The method of producing chemicals in an electric furnace which consists in introducing a charge into the working chamber, passing a suitable electric current through the charge, gradually melting fusible material required for a given reaction within a passage or passages outside of and surrounding the wall of the working chamber by heat of the furnace that would otherwise be lost by radiation, and then combining the same in fused condition with other material within said working chamber.

8. The method of producing chemicals in an electric furnace which consists in gradually melting fusible material required for a given reaction within a passage or passages in the furnace-walls on its way to the inner part of the furnace, and then vaporizing the same, and combining it with other material within said inner part of the furnace.

9. The method of continuously producing bluish of carbon which consists in feeding carbon and sulfur separately and continuously into the working chamber of a suitable electric furnace and toward a heat zone therein, from above and below each heat zone, there passing through the charge a suitable electric current until the reaction is effected, and carrying off and condensing the CS_2 vapor.

10. The method of continuously producing bluish of carbon in an electric furnace which consists in supplying the working chamber with carbon, melting sulfur on its way to the working chamber and feeding it

into each chamber beneath the carbon up to a heat zone, there passing a suitable electric current through the charge until the sulfur is vaporized and the reaction is effected, and carrying off and condensing the CS_2 vapor.

11. In the continuous production of bluish of carbon in an electric furnace, the method which consists in making sulfur on its way to the working chamber, there feeding the same upwardly to the heat zone and vaporizing it, feeding carbon downwardly upon the melted sulfur, and passing a suitable electric current through the charge to effect the heating.

12. In the continuous production of bluish of carbon in an electric furnace, the method of introducing the carbon and sulfur and regulating the electric current which consists in feeding sulfur upwardly to the heat zone within the working chamber, there vaporizing it, feeding carbon downwardly upon the sulfur, introducing between the two conducting material in fragments, and passing the electricity through the furnace by way of said fragments.

13. In the production of bluish of carbon in an electric furnace, the method which consists in introducing carbon and sulfur into the working chamber, passing therethrough a suitable electric current, and feeding a portion of the sulfur upon the electric conductors so as to melt in contact therewith on its way to the working chamber, for the purpose of cooling said conductors.

14. In the production of chemicals within an electric furnace, the method which consists in introducing the charge, passing therethrough a suitable electric current, feeding into contact with more or less of the working surface of an electrode a non-conducting liquid, and regulating the electric current by each contact.

15. In the production of chemicals within an electric furnace, the method which consists in introducing the charge, passing therethrough a suitable electric current, and maintaining at any desired level in the furnace, with reference to an electrode, a bath of a non-conducting molten substance covering more or less of the working surface of said electrode, whereby the electric current is regulated.

16. In the production of chemicals within an electric furnace having horizontal electrodes, the method which consists in introducing the charge, passing therethrough a suitable electric current, and feeding molten sulfur upwardly more or less nearly to the top of the electrodes for the purpose of regulating the electric current.

17. In the production of chemicals within an electric furnace, the method which consists in feeding a fusible ingredient of the charge to the heat zone from beneath upwardly, feeding a less fusible ingredient downwardly to the heat zone, there passing through the charge a suitable electric current, and changing the path of the electric current through the furnace from time to time to turn out any piece of said less fusible ingredient that may prevent its regular descent, and to prevent the formation of such piece.

702,118. ELEVATOR OR STORAGE-HOUSE CONSTRUCTION. SENECA H. THOMAS, Minneapolis, Minn. Filed Mar. 22, 1901. Renewed Jan. 31, 1902. Serial No. 52,973. (No model.)

Claim.—1. An elevator or storage-bin having each of its walls in the form of an arch that lies in a substantially vertical plane with its convex surface on the inside of the bin, suitable upright columns or pilasters at the ends of each arch, each column or pilaster forming a support horizontally for two or more arches, and tie-rods anchored in said columns at intervals between the top and bottom of each arch and rigidly connecting its ends, substantially as described.

2. An elevator or storage-bin rectangular in form having each of its walls in the form of an arch that lies in a substantially vertical plane with its convex surface on the inside of the bin, suitable upright columns or pilasters at the ends of each arch, each column or pilaster forming a support horizontally for arches at right angles to each other, and tie-rods anchored in said columns at intervals between the top and bottom of each arch and rigidly connecting its ends, substantially as described.

3. A series of abutting storage-bins substantially square in cross-section, each bin having its walls in the form of an arch that lies in a substantially vertical plane with its convex surface on the inside of the bin, the ends of each arch meeting the ends of the arches forming the abutting walls of the same bin and also meeting the corresponding ends of the oppositely-curved arch of the adjacent bin and each arch forming a complete wall of the bin, upright columns or pilasters provided at the corners and intersecting the meeting ends of said arches, and tie-rods anchored in said columns and extending between the opposite arches at intervals between the top and bottom of the same and rigidly connecting their ends, substantially as described.

4. An elevator or storage-bin having each of its walls in the form of an arch that lies in a substantially vertical plane with its convex surface on the inside of the bin, suitable upright columns at the ends of each arch and forming supports horizontally therefor, and means connecting said columns and binding or tying the arches together.

702,118.

702,119. BRICK FOR STORAGE-BIN CONSTRUCTION. SENECA H. THOMAS, Minneapolis, Minn. Filed June 17, 1901. Serial No. 54,906. (No model.)

Claim.—1. A series of grain-bins having walls intersecting each other substantially at right angles and composed of blocks laid in courses one upon the other with a suitable binding material between them, the length of the blocks intermediate to the intersections of the walls being with respect to their width in the ratio of two to one, and those at the intersections in the ratio of three to one to permit the blocks of the intersecting walls to be tied thereto and said intermediate and intersection blocks having a series of small holes or perforations regularly arranged therein, the holes in the blocks of one course registering with those in the blocks of the adjacent course, and dove-tail pins fitting into said holes to bind the intermediate blocks together and to the projecting ends of the longer blocks at the intersections of the walls, and a suitable filling material with which the holes in said blocks are filled and wherein the pins are firmly embedded and the courses bound together.

2. A grain-bin having its walls intersecting each other substantially at right angles and composed of blocks laid in courses one upon the other with a suitable binding material between them, each block having a series of holes or perforations arranged in groups, the holes of one group in a block being adapted to register with those in the abutting block of the adjacent course, the blocks at the intersections of the walls being longer than those intermediate to the intersections, the ends of said intersection-blocks projecting beyond the cross-walls, dove-tail pins fitting into said holes to bind the intermediate blocks together and to the projecting ends of the longer blocks at the intersections of the walls, a suitable filling material with which the holes in said blocks are filled and wherein the pins are firmly embedded and the courses bound together.

firmly embedded and the courses and walls bound together, and tie-rods connecting the opposite walls and preventing the same from being pressed or bulged outward by the contents of the bin.

3. A bin having double walls with a space between them, each wall being composed of bricks or blocks that are each provided with a series of small holes or perforations those of each brick coinciding with the corresponding holes in the bricks of the adjacent course, cross-bricks having their ends inserted between the courses at intervals from the top to the bottom of the bin and bridging the space between the walls, each cross-brick having holes registering with the corresponding holes in the bricks abutting thereon, dove-tail pins fitting the holes in said cross and abutting bricks and binding or tying the courses of abutting and cross bricks, and a filling material for said holes wherein said pins are embedded and firmly held and the walls and courses securely tied together, substantially as described.

4. A series of grain-bins having walls intersecting each other substantially at right angles and composed of blocks laid in courses one upon the other with a suitable binding material between them, the length of the blocks at the intersections of the walls being longer than those intermediate to the intersections to permit the blocks of the intersecting walls to be tied to them at the intersections and said intermediate and intersecting blocks having a series of small holes or perforations arranged therein, the holes in the blocks of one course registering with those of the blocks in the adjacent course, and dove-tail pins fitting into said holes to bind the intermediate blocks together and to the projecting ends of the longer blocks at the intersections of the walls, and a suitable filling material with which the holes in said blocks are filled and wherein the pins are firmly embedded and the courses bound together.

5. A grain-bin having its walls intersecting each other substantially at right angles and composed of blocks laid in courses one upon the other with a suitable binding material between them, each block having a series of holes or perforations arranged in groups, the holes of one group in the block being adapted to register with those of the abutting block in the adjacent course, the blocks at the intersections of the walls being longer than those intermediate to the intersections, the ends of said intersection-blocks projecting beyond the cross-walls, dove-tail pins fitting into said holes to bind the intermediate blocks together, and to the projecting ends of the longer blocks at the intersections of the walls, a suitable filling material with which the holes in said blocks are filled and wherein the pins are firmly embedded and the courses and walls bound together, and means for tying the walls together and preventing the same from being pressed or bulged outward by the contents of the bin.

702,120. AIR-SHIP. HARVEY E. VAN VOORSE, FRANKFURT, Pr. Filed Dec. 11, 1901. Serial No. 55,453. (No model.)

Claim.—1. In an air-ship, a car, ceilinging wings secured in the side thereof in different horizontal planes, and means for moving said

wings in parallel horizontal planes and alternately in opposite directions; substantially as specified.

2. In an air-ship, a car, oscillating wings secured to the sides thereof in different horizontal planes, means for moving said wings in parallel horizontal planes and alternately in opposite directions, and wings pivotally mounted at one end to rotate in a vertical plane at each side of said car; substantially as specified.

3. In an air-ship, a car, oscillating wings secured to the sides thereof in different horizontal planes, means for moving said wings in parallel horizontal planes and alternately in opposite directions, wings pivotally mounted at one end to rotate in a vertical plane at each side of said car, and blades at the rear of the car connected to oscillate laterally toward and from each other in unison with said oscillating wings; substantially as specified.

4. In an air-ship, a car, oscillating wings secured to the sides thereof in different horizontal planes, means for moving said wings in parallel horizontal planes and alternately in opposite directions, wings pivotally mounted at one end to rotate in a vertical plane at each side of said car, blades at the rear of the car adapted to oscillate laterally toward and from each other, a balloon for supporting said car, and driving means at each side of the car for connecting said wings and blades and operating them alternately; substantially as specified.

5. In an air-ship, a car, oscillating wings mounted in a vertical plane at opposite sides thereof and at the front and rear, a driving-shaft and connections for operating said wings in unison, oscillating wings in the same vertical plane as said first-mentioned wings and in a different horizontal plane, and means for oscillating said wings alternately in opposite directions in the first-mentioned wings; substantially as specified.

6. In an air-ship, a car, oscillating wings mounted in a vertical plane at opposite sides thereof and at the front and rear, a driving-shaft and connections for operating said wings in unison, oscillating wings in the same vertical plane as said first-mentioned wings, and in a different horizontal plane, means for oscillating said wings alternately in opposite directions to the first-mentioned wings, a rotating wing having an arm pivoted at one end to said car, and a crank-arm from said driving-shaft connected to said rotating wing for actuating the same in a vertical plane, substantially as specified.

7. In an air-ship, a car, a rotary propelling-wing pivoted thereto at one end and provided with overlapping slots, a solid top section to said wing, and means beyond its pivoted connection for rotating said wing in a vertical plane; substantially as specified.

8. In an air-ship, a circular balloon formed of a series of segmental sections disposed with their edges together, and means for introducing buoyant fluid into said sections; substantially as specified.

9. In an air-ship, a balloon, a filling-stack for supporting the same having inlet and outlet openings communicating with said balloon in different planes, and a valve at the upper end of said stack; substantially as specified.

10. In an air-ship, a circular balloon formed of a series of sections substantially V-shaped in vertical section, disposed with their edges together and a filling-stack having openings communicating with each section; substantially as specified.

11. In an air-ship, a car, a supporting-balloon therefor, independent wings disposed in a vertical plane at each end of said car on opposite sides thereof, a driving-shaft provided with a crank-arm, a pivoted lever upon said car, a connection between said crank-arm, lever, and one set of said wings, a connection between the opposite end of said lever and another set of said wings to oscillate the wings alternately in opposite directions; substantially as specified.

12. In an air-ship, a car, a supporting-balloon therefor, independent wings disposed in a vertical plane at each end of said car on opposite sides thereof, a driving-shaft provided with a crank-arm, a pivoted lever upon said car, a connection between said crank-arm, lever and one set of said wings, a connection between the opposite end of said lever and another set of said wings to oscillate the wings alternately in opposite directions, a standard carried by the connection from said crank-arm, a rotating wing having a pivoted support upon said standard and a pivoted connection at its inner end to the car, and a top section to said wing; substantially as specified.

13. In an air-ship, a car, a supporting-balloon therefor, independent wings disposed in a vertical plane at each end of said car on opposite sides thereof, a driving-shaft provided with a crank-arm, a pivoted lever upon said car, a connection between said crank-arm, lever and one set of said wings, a connection between the opposite end of said lever and another set of said wings to oscillate the wings alternately in opposite directions, a standard carried by the connection from said crank-arm, a rotating wing having a pivoted support upon said standard and a pivoted connection at its inner end to the car, a top section to said wing, opposite blades pivoted at the rear of said car and adapted to move toward and from each other in the movement of the wings, a rubber for guiding said

car, and means for driving the wings and blades upon either side of the car independently of the other side; substantially as specified.

702,181. FOOT-STRAP FOR DRAWERS. MARGARET D. WILSON, Portsmouth, Va. Filed Feb. 27, 1902. Serial No. 95,990. (No model.)

Claim.—The herein-described foot-strap to hold down drawers-legs, comprising a flexible strap having a pin whose frame is secured to one end of said strap; and a heel secured to the frame of said pin, there being provided holes in the other end of said strap to receive said heel, as and for the purpose set forth.

702,122. COFFEE-POT. CHARLES E. REIMER, Portsmouth, Pa. Filed Jan. 22, 1902. Serial No. 95,990. (No model.)

Claim.—1. A coffee-pot having its sides provided with intermediate inward projections, a cylindrical percolator supported upon said projections, said percolator having perforated sides and a closed bottom supported above the bottom of the pot, and a removable perforated metallic cylinder with an open top, within the percolator-cylinder and forming an annular space between the two cylinders substantially as described.

2. A coffee-pot having inward projections and a percolator supported on said projections and having perforated sides and a closed bottom above the bottom of the pot, an open-topped perforated cylinder of smaller diameter within the percolator-cylinder and extending to its bottom, and a centering device for holding the inner cylinder centrally within the percolator; substantially as described.

3. A coffee-pot having a percolator with a cylindrical perforated shell and a closed bottom, the percolator being supported within the pot with its bottom above the bottom of the pot, an inner removable perforated shell of smaller diameter than the percolator, and an outwardly-projecting flange at the bottom of the inner shell fitting upon the closed bottom of the percolator; substantially as described.

4. A coffee-pot having an upper cylindrical portion with inward projections at its lower end, a spout in said cylindrical portion, a cover having a reversible shell fitting within the cylindrical part of the coffee-pot and having a perforated side portion, and a percolator having a flange resting on the inward projections, the shell being arranged to hold the flange down upon said projections; substantially as described.

5. A coffee-pot having an upper cylindrical portion with an inward head at its lower end, a spout in the cylindrical portion, a percolator having projections resting on the head and supporting the percolator above the bottom of the pot, said percolator having perforated sides and a closed bottom, an inner perforated cylinder within the percolator having an annular space between the two, and a cover having a perforated reversible

shell within the upper cylindrical portion of the pot; substantially as described.

702,123. TOBACCO-STEAMER. CHARLES M. ARNOLD, Naperville, Ky. Filed Apr. 5, 1902. Serial No. 161,565. (No model.)

Claim.—1. In a tobacco-steamer, a casing provided with a door, a basket therein, a steaming device within said casing provided with a valve, and a connection between said valve and door for operating the former; substantially as specified.

2. In a tobacco-steamer, a casing provided with a door, a basket therein, a steaming device within said casing provided with a valve, a connection between said valve and door for operating the former, a track within said casing above said steaming device, and a track-section upon said door in alignment with the track of the casing; substantially as specified.

3. In a tobacco-steamer, a casing provided with a door, a basket therein, a steaming device within said casing provided with a valve, a connection between said valve and door for operating the former, a track within said casing above said steaming device, a track-section upon said door in alignment with the track of the casing, an angular apex to said casing, and a guarded drain connection at the lower portion of said casing; substantially as specified.

4. In a tobacco-steamer, a casing having a circular outline at its lower portion merged into an angular apex, at the upper central portion thereof, a door to said casing, a basket within the casing, and a steaming device therein; substantially as specified.

5. In a tobacco-steamer, a casing having a circular outline at its lower portion merged into an angular apex, a door to said casing, a basket within the casing, a steaming device therein, a drain connection at the base of said casing, an inclined guard-plate above said drain, and a curved outlet at the edge of said guard-plate; substantially as specified.

6. In a tobacco-steamer, the combination with a casing, of the tobacco-receptacle supported therein, a steaming device comprising a valve, a steam connection communicating therewith, a plate at the outlet side of said valve, and a disk vertically movable toward and from said plate; substantially as specified.

7. In a tobacco-steamer, the combination with a casing, of the tobacco-receptacle supported therein, a steaming device comprising a valve, a steam connection communicating therewith, a plate at the outlet side of said valve, a disk resting on said plate, a steam-chamber formed centrally of said disk, hinges to limit the vertical movement of the disk; substantially as specified.

8. In a tobacco-steamer, the combination with a casing, of a tobacco-receptacle supported therein, a steaming device comprising a valve, a steam connection communicating therewith, a plate at the outlet side of said valve, a disk resting on said plate, a steam-chamber formed centrally of said disk, hinges to limit the vertical movement of the disk, a pivoted door for said casing provided with a lever-arm, and a connection therefrom to said valve; substantially as specified.

9. In a tobacco-steamer, the combination with a casing, of a receptacle supported therein, a steaming device comprising a valve, a steam connection communicating therewith, a plate at the outlet side of said

valve, a disk resting on said plate, a steam-chamber formed centrally of said disk, hinges to limit the vertical movement of the disk, a pivoted door for said casing provided with a lever-arm, a lever pivoted to the under face of said plate and bearing upon a stem from said valve, and a pivotal connection between the free end of said lever and the lever-arm from said door; substantially as specified.

10. In a tobacco-steamer, a casing provided with a door-opening, a door for said opening, having an end portion extending within said casing, legs secured to the outside of said casing, pivoting-legs secured to said door, a pivoting-rod extending through said legs, and a coiled spring disposed upon said rod for automatically closing said door into a vertical position; substantially as specified.

702,124. FLUID-PRESSURE BRAKE APPARATUS. NATHAN J. BURTON, New Decatur, Ala., assignor of one-half to William F. Thomas, Birmingham, Ala. Filed May 2, 1901. Serial No. 95,990. (No model.)

Claim.—1. In a fluid-pressure brake apparatus, a triple valve having an exhaust-port 3 that discharges into the outer air, in combination with a spring-pressed retaining-valve to close said port, said retaining-valve normally opening said exhaust-port, and fluid-pressure connections to operate said retaining-valve and cause the same to close said exhaust-port when the brakes are set; substantially as described.

2. In a fluid-pressure brake apparatus, the combination with a triple valve having an exhaust-port 3 that discharges into the outer air, of a spring-pressed retaining-valve to close said port, an engineer's brake-valve, a train-pipe line between said triple valve and said engineer's brake-valve, a train-pipe line between the main train-pipe exhaust-port of the engineer's brake-valve and said retaining-valve, whereby the latter can be operated by the exhaust from the engineer's valve, and a three-way cock in said retaining-valve pipe-line; substantially as described.

3. In a fluid-pressure brake apparatus, the combination of a triple valve having an exhaust-port 3, a fluid-pressure operated retaining-valve to close said port, said valve being normally open, an engineer's brake-valve, a train-pipe line between said valve and the triple valve, a train-pipe line between said retaining-valve and the main train-pipe exhaust-port of the engineer's valve, a three-way cock in said retaining-valve pipe-line, and a connection, including a cut-off valve, between said retaining-valve pipe-line and the main air-reservoir; substantially as described.

4. In a fluid-pressure brake apparatus, the combination of a triple valve having an exhaust-port 3 that discharges into the outer air, a normally open fluid-pressure operated retaining-valve to close said exhaust-port, a train-pipe line leading from said triple valve, a train-pipe line communicating with said retaining-valve, to operate and close the same, means to exhaust from said retaining-valve pipe-line and means to diffuse

exhaust from the brake-line, to operate said retaining-valve, substantially as described.

702,195. MANUFACTURE OF HEST TUBES. JAMES F. BOW-
LER, Detroit, Mich. Filed Jan. 4, 1901. Serial No. 48,894. (No model.)

Claim.—1. A hest tube made in two symmetrical parts joined together edge to edge, bound by hoops at their ends and united along their long meeting edges by hosing, substantially as described.
2. A tube constructed of symmetrical parts shaped to produce when assembled the complete tube, and having the ends bound by rings, said tube having the various parts united together and the surface covered with hosing material by being dipped in the molten hosing material, substantially as described.

702,196. PROCESS OF MAKING ALPHA-IONONE. PHILIPPE
CHERT and FRANK BACHMANN, Geneva, Switzerland, assignors to Chert,
Neef & Co., Geneva, Switzerland, a Firm. Filed Sept. 25, 1901. Serial
No. 78,898. (No specimens.)

Claim.—1. The herein-described process of producing alpha-ionone, consisting in reacting on pseudo-ionone with cyropy phosphoric acid at a low temperature, treating the product with a solution of sodium in the presence of ammonium chloride, adding sodium chloride and precipitating quantitatively from the thus-obtained mixture the sodium salt of the hydrocarbon acid of the alpha-ionone, and decomposing the same by suitable methods to yield alpha-ionone in a pure and entirely colorless form, substantially as described and for the purpose specified.

2. The herein-described process of producing alpha-ionone from a mixture of cyclo-isomers consisting in treating the acid mixture with a solution of sodium in the presence of ammonium chloride, adding sodium chloride and precipitating quantitatively from the thus-obtained mixture the sodium salt of the hydrocarbon acid of the alpha-ionone, and decomposing the same by suitable methods to yield alpha-ionone in a pure and entirely colorless form, substantially as described and for the purpose specified.

702,197. GRAIN-DRYER. JOHN F. CONNELL, Indianapolis, Ind.
Filed July 21, 1901. Serial No. 78,404. (No model.)

Claim.—1. In a grain-dryer, a drying-cylinder formed of cylindrical sections having an outside and an inside wall with a chamber between them, and means for securing said sections adjacent to each other to form the cylinder.

2. In a grain-dryer, a drying-cylinder formed of cylindrical sections with an independent annular steam-chamber in each section, and means for securing said sections adjacent each other to form the cylinder.

3. In a grain-dryer, a drying-cylinder formed of cylindrical sections with an independent annular steam-chamber in each section, means for introducing steam into the upper portion of each steam-chamber, and means leading from the lower portion of each chamber for draining the same.

4. In a grain-dryer, a drying-cylinder formed of cylindrical sections with an independent annular steam-chamber in each section, a valve-controlled steam-pipe, pipes therefrom to supply the steam-chamber in each section, a valve-controlled drainage-pipe, and a pipe leading therefrom from the lower portion of each of said steam-chambers.

5. In a grain-dryer, a drying-cylinder composed of a number of sections, a supporting-flange on each side of each section, a pair of horizontal bars, and means for securing the flanges of said sections to the bars, whereby the sections will be supported between the bars tightly against each other to form a cylinder.

6. In a grain-dryer, a drying-cylinder formed of sections with an annular steam-chamber in each section, the edge of one section overlapping a portion of the edge of the adjacent section, and means for secur-

ing them together in each position, whereby a closed drying-cylinder is formed.

7. In a grain-dryer, a heating-cylinder formed of sections, an annular steam-chamber in each section and having outward extensions from its periphery, a casing surrounding said sections, means for securing said casing to the extensions from the sections of the heating-cylinder, openings in the casing at one end for the admission of air between the casing and the cylinder, and a passage-way from the space between said casing and cylinder to the interior of the cylinder.

8. In a grain-dryer, a heating-cylinder formed of sections with an annular steam-chamber in each section and said sections having on each side a laterally-extending flange, a pair of bars one on each side of said cylinder, a conical casing surrounding the under side of the cylinder with its edges turned laterally and resting upon said bars beneath the flanges from the sections of the cylinder, a conical casing surrounding the upper portion of the cylinder with its edges turned laterally and resting upon the flanges from the sections of the cylinder, and means for securing the edges of the parts of the casing and the flanges of the sections of the cylinder and the supporting-bars together.

9. In a grain-dryer, cylindrical end frames mounted on suitable supports, supporting-bars extending between and secured to said end frames, one along each side of the machine, a drying-cylinder formed of sections with a laterally-extending flange on each side, and means for securing the flanges of said sections to the supporting side bars of the machine.

10. In a grain-dryer, a drying-chamber surrounded by a steam-heating chamber, an air-heating chamber surrounding the steam-heating chamber, means near the middle of the machine for withdrawing the air from the drying-chamber, and a passage-way at each end of the machine from the air-heating chamber into the drying-chamber.

11. In a grain-dryer, lighting means consisting of a shaft with a number of hubs secured thereto with radiating arms having a cover cap, a light-bulb with a screw cap fitting against said rotary arms and transversely clotted, and a bolt extending from said arms through the clotted shaft of the light-bulb, whereby the position of the bulb may be adjusted.

702,198. DEVICE FOR PERFORATING WELL-CAVITIES. THOMAS
E. CLARK, Vienna, Cal. Filed June 7, 1901. Serial No. 65,864. (No model.)

Claim.—1. In a device of the class described, the combination with the casing having an upper internally-threaded end, and a perforating mechanism including an expander having a shaft passed outwardly through the upper end of the casing, of a two-part guide-collar disposed slidably upon the shaft and having a lower threaded end for engagement with the threads of the casing.

2. In a device of the class described, the combination with the casing having the upper internally-threaded end, and a perforating mechanism including a shaft passed outwardly through the threaded end of the casing and movable throughout, of a collar having a lower threaded

end for engagement with the threads of the casing and having a central longitudinal bore in which the shaft is slidably received, the collar comprising two sections divided in a plane including the axis of the bore, said sections having laterally-extending flanges and clamping-bolts engaged with the flanges to hold the sections together.

702,199. CONTROLLER FOR PROPELLERS. WILLIAM COOPER,
Denver, Colo. Filed Apr. 27, 1901. Serial No. 57,006. (No model.)

Claim.—1. In steam-driven vessels, the combination of a propeller; a horizontal cylinder in the hull of said vessel open to its full diameter to the sea at a point in the stern of said vessel adjacent to said propeller; a piston reciprocating in said cylinder and acted upon in one direction by sea-pressure and in the other direction by mechanical means; bellows; propelling-engines; a steam-line connecting said bellows and said propelling-engines; an exhaust-valve in said steam-line operated by said piston.

2. In steam-driven vessels, the combination of a propeller; a horizontal cylinder in the hull of said vessel open to its full diameter to the sea at a point in the stern of said vessel adjacent to said propeller; a piston reciprocating in said cylinder and acted upon in one direction by sea-pressure and in the other direction by mechanical means; bellows; propelling-engines; a steam-line connecting said bellows and said engines; a valve in said steam-line; an exhaust on said steam-line between the bellows and said valve and coupled with said valve, and means whereby said valve is operated by the movement of said piston in said cylinder.

3. In steam-propelled vessels, the combination of a propeller; a hori-

zontal cylinder in the hull of said vessel open to its full diameter to the sea at a point in the stern of said vessel adjacent to said propeller; a piston reciprocating in said cylinder and acted upon in one direction by sea-pressure and in the other direction by mechanical means; bellows; propelling-engines; a steam-line connecting said bellows and propelling-engines; a valve controlled by the reciprocation of said piston in said cylinder, and means for reducing the pressure in said steam-line between said bellows and said valve when said valve is closed.

702,180. MANUFACTURED TOBACCO. WILLIAM A. FOSTER,
South Boston, Va. Filed Feb. 15, 1902. Serial No. 54,251. (No model.)

Claim.—A sweetened or flavored leaf of tobacco, partly stemmed, and folded upon itself, having the blade ends locked between the folds, unwrapped, as a finished manufactured article.

702,181. SYRUP-COOK FOR SODA-WATER FOUNTAINS. ROBERT
H. GREEN, JR., Philadelphia, Pa., assignor to Robert H. Green &
Sons, Philadelphia, Pa., a Firm. Filed Feb. 25, 1901. Serial No. 44,782.
(No model.)

Claim.—1. In a soda-water fountain, a syrup-cook having a rotary stem formed in sections with means for detachably engaging one with the other, a cap on the fountain in which the handle-section is mounted and shiftable, and a resilient clamp in said cap, said clamp having on the circumference thereof differently-disposed shoulders with either of which said clamp may engage respectively in the in and out position of the section.

2. In a soda-water fountain, a syrup-cook having a rotary stem formed in sections, the handle-section being shiftable in and out, a cap on the fountain in which said section is mounted, differently-disposed shoulders on said handle-section, and a resilient clamp in said cap adapted to bear freely against either of said shoulders respectively in the in and out positions of the section and during the rotation of the latter.

3. In a soda-water fountain, a syrup-cook having a rotary stem formed in sections, with means for detachably connecting the same, a cap on the fountain in which the handle-section is mounted, differently-disposed shoulders on the periphery of said handle-section, and resilient clamps in said cap adapted to freely engage with either of said shoulders relatively to the in and out position of said section and during the rotation of the latter.

4. In a soda-water fountain, a syrup-cook having a rotary stem formed in sections with means for detachably connecting the same, the handle-section thereof being shiftable in and out and having differently-disposed shoulders circumferentially thereon, a cap on the fountain on which said sections are mounted, and a resilient clamp in said cap adapted to freely engage with either of said shoulders while said section is at rest and during the rotation of the same.

5. A syrup-cook having a stem formed in sections, the outer or handle section being shiftable in and out, a cap in which said section is mounted, the interior of the same having a shoulder thereon, and a clamping device within said cap adapted to engage said section, said device having a flange which abuts against said shoulder, and a ring connected with said cap and bearing against said flange.

6. In a soda-water fountain, a syrup-cook having a rotary stem formed in sections with means for detachably engaging and disengaging one with and from the other, a cap on the fountain in which the handle-section is mounted and shiftable, differently-disposed seats on the periphery of said section, and a tongue-shaped device secured to said cap and freely controlling said handle-section and adapted to engage respectively with said seats relatively to the in and out position of the section and during the rotation of the same.

702,182. SODA-WATER APPARATUS. ROBERT H. GREEN, JR.,
Philadelphia, Pa., assignor to Robert H. Green & Sons, Philadelphia,
Pa., a Firm. Filed Feb. 25, 1901. Serial No. 44,784. (No model.)

Claim.—1. In a soda-water apparatus, having an opening to permit access to the syrup-tank, a face-plate or door for said opening with a side or edge thereof of two or more thicknesses of metal folded on themselves, and means for connecting the axis of said plate or door with the folded side.

2. In a soda-water apparatus, having an opening to permit access to the syrup-tank, a face-plate or door for said opening with the sides or edges thereof folded or rebated on themselves, and means on said folded sides for supporting said plate or door on its axis.

3. In a soda-water apparatus having an opening to permit access to the syrup-tank, a face-plate or door for said opening with a side or edge thereof of two or more thicknesses of metal folded on themselves, and an axis connected with the folded side.

4. In a soda-water apparatus having an opening to permit access to the syrup-tank, a face-plate or door for said opening with a side or edge thereof folded on itself, and a filling-piece between the folds, and means for connecting the axis of said plate or door with the folded side.

5. In a soda-water apparatus having an opening to give access to the syrup-tank, a face-plate or door for said opening with the sides or edges thereof folded or rebated on themselves with a filling-piece under or between the folds preventing moist edges at the front of said door, and means on the folded sides for sustaining said plate or door on its axis.

709,188. SODA-WATER APPARATUS. ROBERT M. GARNER and HENRY M. GARNER, JR., Philadelphia, Pa. Filed Feb. 26, 1901. Serial No. 45,797. (No model.)

Claim.—In a soda-water apparatus, a main chamber, a draft-tube, a wall in the front of said chamber containing said tube, a supplemental chamber below said main chamber, an opening below said wall in communication with said supplemental chamber, a tank in the supplemental chamber, tanks in the main chamber aside of said wall and supplemental chamber, and doors for said main and supplemental chambers.

709,184. MILK-COOLER. WILLIAM L. HALEY, Albia, Tex. Filed Feb. 13, 1902. Serial No. 93,741. (No model.)

Claim.—1. A device of the class described comprising a removable bottom pan having openings, sockets or sleeves extending upward from the bottom of the pan at the said openings, posts or uprights extending through the sockets or sleeves and the openings of the bottom of the pan and projecting below the latter to form legs, shelves supported by the posts or uprights, a fabric covering extending into the bottom pan, and a water-receptacle, substantially as described.

2. A device of the class described comprising a bottom pan having openings, L-shaped sleeves extending upward from the bottom of the pan at the openings and forming sockets, angle-iron posts extending through the sleeves and through the openings of the bottom pan and extending below the same to form feet, shelves provided with flanges secured to the posts or uprights, a fabric covering extending into the bottom pan, and a water-receptacle, substantially as described.

3. A device of the class described comprising a frame composed of angle-iron corner-posts, shelves secured to the same, and the angle-iron top connecting-pieces having horizontal flanges, a fabric covering arranged on the frame and extending over the upper faces of the horizontal flanges of the top connecting-pieces, a water pan or receptacle having partitions arranged directly over the said horizontal flanges, and a bottom pan or receptacle supported by the frame, substantially as described.

709,185. DIPPING-TANK. GEORGE M. KIPPENHART, Indianapolis, Ind. Filed Oct. 14, 1901. Serial No. 73,602. (No model.)

Claim.—1. A dipping-tank having sides and a flat bottom with the two ends thereof curved upward and inward converge toward each other, and means for supporting the tank in a horizontal position so it can be tilted.

2. A dipping-tank consisting of sides and a bottom with its ends curved upward and inward toward each other, a bar secured to the inward edge of each end to reinforce the same, and means for tiltingly supporting said tank in a horizontal position.

3. A dipping-tank comprising a base with rebars, and a horizontal tank secured thereon with suitable sides and with the ends of the tank curved upward and inward toward each other, and a horizontal bar at

each end extending from one side of the tank to the other and secured to the inner edge of the upturned ends for reinforcing the same.

4. A horizontal dipping-tank with a depression or groove extending crosswise in the bottom thereof, and means for tiltingly supporting said tank.

5. A horizontal dipping-tank with a depression or groove in the bottom thereof, and a flange forming an outlet from said depression or groove.

6. A dipping-tank consisting of a rocking frame, and a tank mounted on said rocking frame having a flat bottom with its sides substantially vertical and its ends curved upward and inward with the inner edges of the inward ends reinforced by suitable bars, a depression in the bottom of said tank, and means for draining said depression.

709,186. FEED-BRUSH. MARION C. HALL, Chicago, Ill. Filed Nov. 3, 1901. Serial No. 81,152. (No model.)

Claim.—1. A brush for cleaning split fish, consisting of an edge-wise-operative base or handle composed of two sections each having the inner faces, and lying broadside to each other, a row of edge bristles and a row of side bristles adjacent to the edge bristles on each section of the base or handle, the rows of bristles extending longitudinally of the base or handle, and the rows of side bristles standing obliquely to the side faces of the base or handle and out or beveled at their free ends to converge toward each other and furnish with the edge bristles a brush-surface for cleaning the center and sides of a split fish, substantially as described.

2. A brush for cleaning split fish, consisting of an edge-wise-operative base or handle composed of two sections each having flat inner faces and lying broadside to a row of edge bristles and a double row of side bristles adjacent to the edge bristles on each section of the base or handle, the rows of bristles extending longitudinally of the base or handle, and the rows of side bristles standing obliquely to the side faces of the base or handle and out or beveled at their free ends to converge toward each other, furnishing with the edge bristles a brush-surface for cleaning the center and sides of a split fish, and a fastening-wire between the two sections securing the bristles from within, substantially as described.

3. A brush for cleaning split fish, consisting of an edge-wise-operative base or handle composed of two sections each having flat inner faces and lying broadside to each other, one of the sections having a depression in its face, a row of edge bristles and a double row of side bristles adjacent to the edge bristles inserted within holes in each section of the base or handle, the rows of bristles extending longitudinally of the base or handle and the rows of side bristles standing obliquely to the side faces of the base or handle and out or beveled at their free ends to converge toward each other, furnishing with the edge bristles a brush-surface for cleaning the center and sides of a split fish, and a wire lying between the two sections securing from within the bristles inserted into the holes in the sections, substantially as described.

709,187. RING FOR BOOTS OR SHOES. JAMES H. JAMMER, Chicago, Ill. Filed Mar. 27, 1901. Serial No. 65,899. (No model.)

Claim.—1. A heel for boots and shoes made of an upper section or division and a lower section or division, a plate having therein a hole and being fixedly attached to one of the sections or divisions and provided on its face with a series of recesses formed by cutting tangens in the plate and bending the same back from the body of the plate to leave the cut and flange of the recesses free and to provide the back face with a beveled or cam surface, a companion plate fixedly attached to the other section or division provided with an outwardly-flanged stem or stud entered into the hole of the other plate and being further provided with a series of fixedly and permanently attached lugs projecting into and engaging with the series of recesses when the two sections of the heel are in engagement, and a spring outside of the stem or stud contacting with the

flange thereof to normally hold the two sections of the heel into engagement and to normally hold the series of lugs into engagement with the cut and flange of the series of recesses but allowing of lateral movement in one direction upon the application of sufficient lateral pressure to force the non-engaging faces of the lugs against the beveled or cam face of the recesses, thereby compressing the spring and releasing the catch, substantially as described.

2. A heel for boots and shoes made of an upper section or division angular at its forward side curving at its rear side and having its lower rear portion cut away, provided with a semicircular recess in its lower forward portion and a circular recess in its upper body a lower section or division fitting into the semicircular recess in the lower forward portion of the upper section or division, a plate fixedly attached to the upper section or division and having at its outer side edges guard-plates to protect the leather of the forward portion of the upper section or division and provided with a series of recesses beveled on their back or non-engaging faces to form cam-surfaces, a companion plate fixedly attached to the lower section or division and provided with an outwardly-flanged stem or stud entered into the hole of the other plate and the recess in the body of the upper section or division and being further provided with a series of fixedly and permanently attached lugs beveled on their back or non-engaging faces to form cam-surfaces, projecting into and engaging with the series of recesses when the two sections of the heel are in engagement, and a spring outside of the stem or stud and contacting with the flange thereof to normally hold the two sections of the heel in engagement and to normally hold the series of lugs in engagement with the series of recesses but allowing of lateral movement in one direction upon the application of sufficient lateral pressure to force the back or non-engaging faces of the lugs against the beveled or cam face of the recesses to compress the spring and release the catch, substantially as described.

709,189. CAN-HEADING MACHINE. FRANK H. LAVERIE, New York, N. Y., assignor to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Mar. 10, 1902. Serial No. 97,485. (No model.)

Claim.—1. In a can-heading machine, the combination of a rotary can-body carrier provided with a series of spring-pockets for receiving and holding the can-bodies, a curved and inclined guide for pressing the can-bodies into the spring-pockets, a can-body feed-chute provided with a vibrating can-body feeder, a pair of can-body feed-chutes provided with a pair of vibrating can-head feeders, a pair of header-rings provided with prongs for the can-heads and furnished with yielding guards to prevent the can-heads from tilting inward, a pair of heading-plungers reciprocating in said header-rings, two pairs of engaging heading-jaws, one pair mounted on each side of said rotary can-body carrier, a pair of adjustable carriages or slides upon which the header-jaws, opening-slides, the header-ring and can-head chutes are mounted, and a discharge for forcing the can-bodies out of the spring-pockets on the carrier as the carrier rotates and mechanism for operating the header-jaws, header-plungers, and can-body feeders, substantially as specified.

2. In a can-heading machine, the combination with an intermittently-rotating can-body carrier provided with spring-pockets to receive and hold the can-bodies, of an inclined and curved guide for forcing the can-bodies into the spring-pockets, substantially as specified.

3. In a can-heading machine, the combination with an intermittently-rotating can-body carrier provided with spring-pockets to receive and hold the can-bodies, of an inclined and curved guide for forcing the can-bodies into the spring-pockets, and an inclined discharger on the stationary frame of the machine for forcing the cans out of the spring-pockets after they are headed, substantially as specified.

4. In a can-heading machine, the combination with an intermittently-rotating can-body carrier having pockets to receive and hold the can-bodies, of a pair of adjustable slides or carriages, one on each side of said rotary carrier, and two pairs of heading-jaws mounted one pair on each of said adjustable carriages, substantially as specified.

5. The combination, in a can-heading machine, with an intermittently-rotating carrier having pockets to receive and hold the can-bodies, of a pair of adjustable slides or carriages, one on each side of said carrier, a header-ring, a can-head chute and a pair of header-jaws having a pair of reciprocating slides for operating the same, all mounted on each of said adjustable carriages or slides, substantially as specified.

6. The combination, in a can-heading machine, with an intermittently-rotating carrier having pockets to receive and hold the can-bodies, of a pair of adjustable slides or carriages, one on each side of said carrier, a header-ring, a can-head chute and a pair of header-jaws having a pair of reciprocating slides for operating the same, all mounted on each of said adjustable carriages or slides, and a pair of heading-plungers, substantially as specified.

7. The combination with a can-head chute, a header-ring having a plunger for the can-heads, a reciprocating heading-plunger, a pair of header-jaws, a pair of reciprocating slides for operating the same movable transversely to the axis of the can-body and an intermittently-rotary can-body carrier having pockets to receive and hold the can-bodies, substantially as specified.

8. The combination with a can-head chute, a header-ring having a plunger for the can-heads, a reciprocating heading-plunger, a pair of header-jaws, a pair of reciprocating slides for operating the same and an intermittently-rotary can-body carrier having pockets to receive and hold the can-bodies, and an adjustable slide or carriage *D'* upon which the can-head chute, header-ring, heading-plunger and their slides are mounted, substantially as specified.

9. In a can-heading machine, the combination with an intermittently-rotating can-body carrier *B* having pockets *b* to receive and hold the can-bodies, and provided with radially-slotted arms *B'*, a shaft *M* having a crank-arm *B'* provided with pin *B'* engaging said slotted arm on the carrier, a spring pawl or lock *B'*, a pair of reciprocating header-jaws *D D'*, a header-ring *F* and heading-plunger *F'*, substantially as specified.

10. In a can-heading machine, the combination with an intermittently-rotating carrier *B* having pockets *b* to receive and hold the can-bodies, of a pair of adjustable carriages or slides *D'*, adjusting-carriers *D'* therefor header-jaws *D D'* and *D D'*, header-slides *D'* and *D'*, header-rings *F F'*, heading-plungers *F F'*, a shaft *M* having arms *m m'*, and connecting-levers *m' m'* for operating the heading-plungers, substantially as specified.

11. In a can-heading machine, the combination with an intermittently-rotating carrier *B*, having pockets to receive and hold the can-bodies, of two pairs of header-slides and header-jaws, one pair on each side of said carrier, a shaft *M* having arms *m m'*, supplemental or operating slides *D' D'*, and connections for operating said header-slides from said slides *D'*, substantially as specified.

12. In a can-heading machine, the combination with an intermittently-rotating carrier *B*, having pockets to receive and hold the can-bodies, of two pairs of header-slides and header-jaws, one pair on each side of said carrier, a shaft *M* having arms *m m'*, supplemental or operating slides *D' D'*, connections for operating said header-slides from said slides *D'*, header-plungers *F F'* and arms *m m'* and connecting-levers for operating said heading-plungers, substantially as specified.

13. In a can-heading machine, the combination with a rotating carrier having pockets to receive and hold the can-bodies, of a pair of header-jaws and header-slides, a heading-ring, a heading-plunger, a can and a supplemental slide operated by the cam for operating said header-slides, a can-body chute, a vibrating can-body feeder, and a connecting-link and lever for operating said feeder by said supplemental slide, substantially as specified.

14. In a can-heading machine, the combination with a rotating carrier having pockets to receive and hold the can-bodies, of a pair of header-jaws and header-slides, a heading-ring, a heading-plunger, a can-head chute, a vibrating can-head feeder, and connecting mechanism between said feeder and one of said header-jaw slides for operating said can-head feeder, substantially as specified.

15. In a can-heading machine, the combination with carrier *B* hav-

ing pockets *b*, adjustable carriages *D'*, header-jaws *D D'*, header-slides *D' D'*, header-ring *F*, heading-plunger *F'*, and a can-chute provided with cam for operating both said header-slides and said heading-plunger, substantially as specified.

16. In a can-heading machine, the combination with a can-body carrier having pockets to receive and hold the can-bodies, of a pair of adjustable slides or carriages and header-rings, header-jaws and slides movable transversely to the axis of the can-body and mounted on said adjustable carriages, substantially as specified.

702,189. PRINTING-MACHINE. EDWARD LEE, Leeds, England.
Filed Dec. 22, 1901. Serial No. 26,999. (No model.)

Claim.—1. In a printing-machine, the combination of an impression-cylinder carrying the printing-surface on its periphery, and means for supplying the same with ink color or varnish, of a transfer-cylinder geared synchronously with it, said transfer-cylinder carrying on its periphery a series of rollers or carriages for carrying the articles to be printed under and against the transfer-surface, and an adjustable cylinder immediately below and between the ends of the upper run of the open pressing with adjustable pressure thereon and its contacts against the transfer-cylinder; substantially as described.

2. The combination of an impression device, taking device, and a transfer-roller with an open carrying the blanks to be printed, pulleys, shafts and sprocket-wheels carrying and driving said open sliding bearings for said shafts, adjusting devices for regulating the distance apart of said bearings, and an adjustable roller supporting the upper run of the open directly beneath the transfer-roller; substantially as described.

3. The combination with the impression device and transfer-cylinder, of an endless carrier below the transfer-cylinder and provided with transverse frames *U, U'* for the articles to be printed, and an elastic roller directly under the transfer-cylinder and supporting the upper run of the endless carrier between the bearings thereof; substantially as described.

702,140. COMPOSITION OF MATTER. GUYOT LE ROY DE LAURENCE, Vienna, France. Filed Dec. 24, 1901. Serial No. 27,985. (No specimen.)

Claim.—The herein-described composition of matter, consisting of a heated and cooled mixture of simple or double salts of alumina and potash, silica, acid of manganese, sulfate of lime, sulfate of baryta, a hydrous oxide, and gravel, substantially as set forth.

702,141. RAILWAY CONSTRUCTION. GUYOT LE ROY DE LAURENCE, Vienna, France. Filed Dec. 24, 1901. Serial No. 27,986. (No model.)

Claim.—A railway construction, consisting of longitudinal sleepers of alderite, rails embedded throughout their entire length continuously in said sleepers and projecting therefrom at the upper side of the same, transverse ties of alderite connecting said sleepers and forming integral

therewith, and gaps completely embedded in said transverse ties and connected at their ends with the rails within the sleepers, substantially as set forth.

702,142. METHOD OF BLEACHING PAPER-PULP. Dr. FREDERICK E. LOTT, Chicago, Ill., assignor to the Hyatt & Robinson Company, a Corporation of South Dakota. Filed June 24, 1901. Serial No. 28,748. (No specimen.)

Claim.—1. The process of bleaching pulp and the like in a closed vessel, which process consists in subjecting a mixed charge of pulp and dilute chloric solution to an electrolyzing-current and, while confined under pressure, maintaining the whole charge bodily in circulation between the anode and cathode elements, substantially as described.

2. The process of bleaching pulp and the like in a closed vessel, which process consists in subjecting a mixed charge of pulp and dilute chloric solution to an electrolyzing-current, simultaneously insulating the gases and other volatiles produced from the body of the charge and, while confined under pressure, maintaining the whole charge bodily in circulation between the anode and cathode elements, substantially as described.

3. The process of bleaching pulp and the like in a closed vessel, which process consists in subjecting a mixed charge of pulp and dilute chloric solution to an electrolyzing-current, expelling the gases and other volatiles produced and, while confined under pressure, maintaining

the whole charge bodily in forced circulation between the anode and cathode elements, substantially as described.

4. The process of bleaching paper-pulp and the like in a closed vessel, which process consists in subjecting a mixed charge of pulp and dilute chloric solution with a controlling addition to an electrolyzing-current, and while confined under pressure, maintaining the whole charge bodily in forced circulation between the anode and cathode elements, substantially as described.

702,143. GAS-LAMP. THOMAS MANNING, Newcastle, Pa. Filed July 17, 1900. Serial No. 28,999. (No model.)

Claim.—1. In a gas-lamp, a primary support, a vertical rod carried thereon and free to move up and down, an arm carried on said rod and free to be turned in various directions horizontally and a globe carried on each arm and free to be partially revolved thereon in a vertical plane, thus allowing of three independent motions, all substantially as herein specified.

2. In a gas-lamp, the combination with a primary support, of a casting *G* having tubular bearing and a rocking dog *H*, a rod *I* vertically movable in said bearing and arranged to be held in an elevated position by frictional pressure from the dog, and a turning device *N N'* arranged transversely under said dog for lifting and holding the latter out of operative position at will, substantially as herein specified.

3. In a gas-lamp, the combination with a primary support, of a casting *G* having tubular bearing and a rocking dog *H*, a rod *I* vertically movable in said bearing and arranged to be held in an elevated position by frictional pressure from the dog, and a screw turning on adjustable pivot for each dog, all substantially as herein specified.

702,144. REFRIGERATOR. EDWARD M. MERRILL, Westmont, Canada. Filed June 12, 1901. Serial No. 28,916. (No model.)

Claim.—1. An isolator comprising a box closed at opposite points, a bandage passed through said slots across the interior of said box in slanting form, and a single retainer extending through the middle of the interior of said box transversely of said slots and engaging the layers of said bandage, holding the alternate opposite edges thereof from the slots of the box adjacent to the edges as held.

2. An isolator comprising a box closed at opposite points, a bandage passed through said slots across the interior of said box in slanting form, and a serpentine retainer extending through the middle of the interior of said box transversely of said slots and the middle of the folds thereof, receiving the layers of said bandage, holding the alternate opposite edges thereof from the slots of the box adjacent to the edges as held, substantially as described.

3. An isolator comprising a box to receive an isolant and having an opening in each end and a hinged valve cover for controlling the opening in one end, a hinge for connecting said cover to said box and

having a rigid hinge pin or spindle projecting at each end beyond said hinge, a bow-spring secured midway of its length to said cover and having its ends bearing upon said ends of the rigid hinge pin or spindle for causing an abnormal friction in said hinge to retain the valvular cover in any position to which it may be moved substantially as described.

4. The combination with the head of an inhaler, of an auxiliary thin elastic head and an elastic band of greater tension retaining said auxiliary head upon said head of the inhaler, substantially as described and for the purpose set forth.

5. The combination with the head of an inhaler, of an auxiliary thin elastic head and an elastic band of greater tension than and integral with said auxiliary head, substantially as described and for the purpose set forth.

702,145. SLATE-CLAMP. JAMES H. MONTGOMERY, Kingston, N. Y. Filed Feb. 4, 1902. Serial No. 28,502. (No model.)

Claim.—1. A device of the class described comprising a base, vertical screw near the opposite ends thereof, each of which is provided with two set-screws and two clamping-bars mounted on said screws between said ends, substantially as shown and described.

2. A device of the class described comprising a base, vertical screws near the opposite ends thereof, each of which is provided with two set-screws and two clamping-bars mounted on said screws between said ends, the central portions of said bars being curved backwardly, substantially as shown and described.

3. A clamp of the class described comprising a base-plate, vertical screw-headed end members connected therewith, two vertically-movable clamping-bars mounted on said end members, and two sets mounted on each of said end members above and below said bars, whereby the vertical position of said bars may be adjusted on said end members, and whereby said bars may be clamped together, substantially as shown and described.

702,146. FOLDING DOOR. EDWARD H. McCLOSKEY, Columbus, Ohio. Filed Apr. 22, 1901. Serial No. 24,572. (No model.)

Claim.—1. In a folding door, the combination with a plurality of door-sections 5, of a folding-truss connection between the ends of said sections, the bars forming said folding truss being pivotally connected with each end of each of said sections at three points and a pivotal connection of one end of each of said folding trusses with a supporting structure, substantially as specified.

2. In a folding door, the combination with the door-sections 5, of a folding or jointed truss connection for the ends of said sections comprising bars 7 each pivotally connecting a set of three of said door-sections and means for hinging or pivotally connecting said folding door with a supporting structure, substantially as specified.

3. In a folding door, the combination with a door-frame and guide-rails on opposite sides thereof, of a folding sectional door comprising sections 5 and truss-bars 7 jointly connecting the ends of said sections as described, the inner pivots of one or more of said truss-bars carrying friction-rollers adapted to run in said guides, a hinged or pivotal connection of said door with a supporting structure and means for counterbalancing the weight of said door, substantially as specified.

4. In a folding door, the combination with a plurality of sections 5, each of said sections having its edge portions and opposite sides provided with projecting longitudinally-arranged plates 17 and recesses 18 formed in said sections on opposite sides from said plates, of a folding-truss connection for the ends of said sections, each of the truss-bars connecting three of said section ends, substantially as specified.

702,147. MINING-MACHINE. JAMES H. MONTGOMERY, Boston, Pa. Filed Jan. 12, 1901. Serial No. 23,000. (No model.)

Claim.—1. In a mining-machine, the combination of a frame, two standard I-rails secured to said frame in substantially the same horizontal plane with their webs in a horizontal position and their flanges extending upward, the downwardly-extending flanges of said rails having grooves formed therein, a traveling carriage resting on the edges of said flanges, laterally-extending lips on said carriage adapted to enter the grooves in the rails, a cutter frame and chain supported by said carriage, and mechanism for moving said carriage along said rails and for driving said chain.

2. In a mining-machine, the combination of a suitable frame, a traveling carriage, a cutter-frame and cutter-chain, mechanism for moving

said carriage and driving said chain, a swinging frame at the forward end of said frame, said frame having an inclined guideway therein, a jack-bar in said guideway, and means for raising and lowering said bar.

3. In a mining-machine, the combination of a suitable frame, a traveling carriage, a cutter-frame and cutter-chain, mechanism for moving said carriage and driving said chain, a swinging frame at the forward end of said frame, said frame having an inclined guideway therein, a jack-bar in said guideway, said bar having teeth therein, a pinion engaging said teeth, and a ratchet-and-pawl device for holding said bar in its adjusted position.

702,148. WINDOW-SHUTTER. JOHN L. FETTERSON, Waterville, Conn., assignor of one-half to Elroy Marsh, Thomaston, Conn. Filed Apr. 4, 1902. Serial No. 24,264. (No model.)

Claim.—A shutter for window-shutters, the ends of which are provided with detachable metal clips having inwardly-directed tubular sockets which fit in corresponding recesses formed in the ends of the shutter and spring-operated bolts mounted in said sockets and projecting therefrom, said bolts being provided with radial pins which pass through slots formed in said sockets and by means of which they are retained in said sockets, substantially as shown and described.

702,149. SWITCHBOARD FOR ILLUMINATING ELECTRIC LAMP SIGNS. MARTIN BROWN, New York, and LOUIS R. GRADY, Brooklyn, N. Y. Filed Mar. 12, 1902. Serial No. 26,000. (No model.)

Claim.—1. In a switchboard device for illuminating electric-lamp signs, the combination with groups of circuit-wires in a fixed position, of groups of circuit-selectors, a movable support therefor, means for effecting a predetermined contact of the circuit-selectors and circuit-wires, a switch for making and breaking the electric circuit, means for changing the position of the movable support of the circuit-selectors, means of greater force than the former means connected to the said movable support of the circuit-selectors and bearing against the switch device whereby a contact of the circuit-selectors and circuit-wires is made before the completion of the electric circuit, and means, the circuit is broken before the separation of the circuit-selectors from the circuit-wires, substantially as set forth.

2. In a switchboard device for illuminating electric-lamp signs, the combination with groups of circuit-wires in a fixed position, of groups of circuit-selectors, a movable support therefor, means for effecting a predetermined contact of the circuit-selectors and circuit-wires, a switch for making and breaking the electric circuit, a spring for changing the position of the movable support of the circuit-selectors, a second spring of greater strength than the former spring connected to the said movable support of the circuit-selectors and bearing against the switch device whereby a contact of the circuit-selectors and circuit-wires is made before the completion of the electric circuit, and means, the circuit is broken before the separation of the circuit-selectors from the circuit-wires, substantially as set forth.

3. In a switchboard device for illuminating electric-lamp signs, the combination with groups of circuit-wires having their ends in the same plane and a suitable support therefor, of groups of spring-actuated circuit-

selectors, a hinged support therefor, a metal plate upon the surface of the support forming electric contact with the circuit-selectors, means for effecting a predetermined contact of the circuit-selectors and circuit-wires, a switch for making and breaking the electric circuit, and springs of varying tension acting between the fixed support of the circuit-wires and the switch upon opposite sides of the movable support for the circuit-selectors, substantially as set forth.

4. In a switchboard device for illuminating electric-lamp signs, the combination with groups of circuit-wires in a fixed position and a suitable support therefor, of groups of spring-actuated circuit-selectors, a hinged support therefor, a metal plate upon the surface of the support forming electric contact with the circuit-selectors, means for effecting a predetermined contact of the circuit-selectors and circuit-wires, a switch for making and breaking the electric circuit, and springs of varying tension acting between the fixed support of the circuit-wires and the switch upon opposite sides of the movable support for the circuit-selectors, and conductors from a source of electricity to part of the switch device, from the mechanism of lamps to another part of the switch device and from the switch device back to the source, whereby a complete circuit is formed through the switch device, the circuit-selectors and circuit-wires and the mechanism of lamps, substantially as set forth.

5. In a switchboard for illuminating electric-lamp signs, the combination with groups of circuit-wires, a support to which the same are connected in a fixed position, a perforated card or sheet, a receptacle for the same in the support of the circuit-wires, whereby predetermined circuit-wires are exposed in the apertures of the sheet, of groups of circuit-selectors, a movable support therefor, a switch for making and breaking the electric circuit, a spring for actuating the support of the circuit-selectors to move the same away from the circuit-wires and a spring of greater tension for supporting the switch in its disconnected position and which acts to make contact of the circuit-selectors and circuit-wires before the completion of the electric circuit by the switch, substantially as set forth.

6. In a switchboard for illuminating electric-lamp signs, the combination with groups of circuit-wires, a support to which the same are connected in a fixed position, a perforated card or sheet, a receptacle for the same in the support of the circuit-wires, whereby predetermined circuit-wires are exposed in apertures of the sheet, of a block of insulating material, groups of circuit-selectors supported thereby, a plate of metal upon the outer surface of the block of insulating material, a hinge connected therewith, a switch device comprising parallel blade-bars, base-plates and pivot-supports therefor and spring-clips and base-plates engaged thereby, a plate forming the other part of the hinge electrically connected to one of the switch-supports, cross-bars of insulating material connecting the switch-bars and circuit connections from a source of electricity to the switch through the hinge to the circuit-selectors, from the circuit-wires to the mechanism of lamps, from the mechanism of lamps back to the other side of the switch and from the switch returning to the source of electric energy, substantially as set forth.

7. In a switchboard device for illuminating electric-lamp signs, the combination with a suitable support and groups of circuit-wires arranged in parallel, horizontal and vertical rows at predetermined spaced-apart intervals and connected thereto in a fixed position, of a block of insulating material having parallel, horizontal and vertical rows of offset apertures spaced apart between centers to agree with the centers of the circuit-wires, a plate *c'* overlying the outer surface of said block and covered thereby, and a plate *c* connected to the plates *c'* and *c''* by a hinged joint and secured to the support of the circuit-wires, circuit-selectors *a* comprising cap and stem portions received in the offset apertures in the block of insulating material, springs within the cap portions of the circuit-selectors with one end bearing against the inner surface of the plate *c'*, means for effecting a predetermined contact of the circuit-selectors and circuit-wires, a switch for making and breaking the electric circuit, springs of varying tension acting against the support of the circuit-wires and the switch and upon opposite sides of the hinged device supporting the circuit-selectors, substantially as set forth.

8. In a switchboard device for illuminating electric-lamp signs, the combination with a suitable support and groups of circuit-wires arranged in parallel, horizontal and vertical rows at predetermined spaced-apart intervals and connected thereto in a fixed position, of a block of insulating material having parallel, horizontal and vertical rows of offset apertures spaced apart between centers to agree with the centers of the circuit-wires, a plate *c'* overlying the outer surface of said block and covered thereby, and a plate *c* connected to the plates *c'* and *c''* by a hinged joint and secured to the support of the circuit-wires, circuit-selectors *a* comprising cap and stem portions received in the offset apertures in the block of insulating material, springs within the cap portions of the circuit-selectors with one end bearing against the inner surface of the plate *c'*, means for effecting a predetermined contact of the circuit-selectors and circuit-wires, a helical spring *p* received in sockets provided thereby in the face of the support of the circuit-wires and in the under surface of the hinged

part carrying the circuit-circuit and acting to separate the block of insulating material from the base or support, a bow-spring i secured at one end to the plates c' and c' of the hinge, a switch having blade-bars, pivots and spring-arms, a cross-bar of insulating material against which the free end of the bow-spring i bears, and an insulating-material handle secured to the switch for actuating the same, substantially as and for the purposes set forth.

702,150. DEVICE FOR SHARPENING SAWS. GEORGE E. PIERCE, Rensselaer, Germany. Filed July 23, 1901. Serial No. 60,140. (No model.)

Claim.—A saw-sharpening device consisting of a holder said holder having two oppositely-arranged pointed curves and a projection arranged at its inner side a file adapted to fit between the curves said file being angular and of uniform cross-section, and provided at its ends near each corner with an indentation whereby the file is held concentrically in its holder for the purpose described.

702,151. METALLIC-CARTRIDGE-LOADING MACHINE. GEORGE E. PIERCE, Cincinnati, Ohio. Filed Aug. 2, 1900. Serial No. 70,007. (No model.)

Claim.—1. In a machine of the class described, a plunger, a series of wad cutting and plating punches mounted thereon, means for actuating said plunger, and a die-plate having a series of openings therethrough

through which said punches operate, in combination with an aligning-block having a compensating series of openings therethrough and through which said punches operate for guiding the punches in their work, and means for advancing the die-plate in successive rows to the action of said punches, as and for the purposes set forth.

2. In a machine of the class described, a wad cutting and plating mechanism, an actuating-plunger therefor, and intermediate connections between said wad cutting and plating mechanism and said actuating-plunger for varying the relative position of said mechanism with respect to said plunger, whereby shells of varying lengths may be operated upon, as and for the purposes set forth.

3. In a machine of the class described, a plunger, wad cutting and plating punches carried thereby, an operating-plunger for said plunger, and intermediate connections between said plunger and plunger for varying the relative position of said plunger and punches, whereby it may become operative at a higher or lower point in relation to the operating crank-shaft of said plunger, as and for the purposes set forth.

4. In a machine of the class described, a plunger, wad cutting and plating punches carried thereby, a plunger for actuating said plunger, means for adjusting the relative position of said plunger with reference to said punches, and means for locking the parts in adjusted position, as and for the purposes set forth.

5. In a machine of the class described, a wad cutting and plating mechanism and a shell-cripping mechanism, a main drive-shaft, and means actuated from said shaft for operating said wad cutting and plating mechanism, and means, also actuated by said shaft, for independently actuating said shell-cripping mechanism, as and for the purposes set forth.

6. In a machine of the class described, wad cutting and plating and shell-cripping mechanisms, a main drive-shaft for actuating the same, and means for independently actuating the operation of each of said several mechanisms, as and for the purposes set forth.

7. In a machine of the class described, wad cutting and plating devices and shell-cripping mechanism, and means for actuating the same, and means for automatically throwing said wad cutting and plating devices out of operation in advance of the start of said crimping mechanism, and means for successively presenting the shells to said parts, as and for the purposes set forth.

8. In a machine of the class described, the combination with an actuating-shaft and driving mechanism therefor, of means for disengaging said shaft from its driving mechanism automatically at a given stage in the loading operation, and means for independently disengaging said driving mechanism at the will of the operator, as and for the purposes set forth.

9. In a machine of the class described, wad cutting and plating mechanism, a drive-shaft therefor, means for automatically arresting said shaft at a given stage in the operation of the machine, and means for automatically actuating said shaft at any point in the operation at the will of the operator, as and for the purposes set forth.

10. In a machine of the class described, the combination of a driving-pulley, a shaft in engagement with said pulley and driven by said pulley, a clutch for disconnecting said pulley and shaft, said shaft having an eccentric for raising and lowering a crimping device, and means for disengaging said eccentric when the operation of the crimping device is not required, as and for the purposes set forth.

11. In a machine of the class described, the combination with a driving-shaft, of a cross-head or plunger, operated by said shaft and provided with guideways, means for adjustably regulating the distance through which said plunger operates, in opening through said plunger to admit of the passage of a wad-shoot, and an independently-movable crimping-bar arranged to operate upon the shells after they have passed beyond said plunger, as and for the purposes set forth.

12. In a machine of the class described, a plunger, wad cutting and plating punches carried thereby, a plunger, means for actuating the same, an eccentric carried by said plunger, and connections between said eccentric and plunger whereby the relative positions of said plunger and punches may be adjusted, as and for the purposes set forth.

13. In a machine of the class described, a plunger, wad cutting and plating punches carried thereby, a plunger for actuating said plunger, said plunger provided with a bearing, a block mounted in said bearing and having an eccentric-pin, said plunger being connected to said eccentric-pin, and means for relatively adjusting said block in its bearing, as and for the purposes set forth.

14. In a machine of the class described, a drive-shaft, wad cutting and plating and shell-cripping devices actuated therefrom, a feed-table, a rack connected thereto, a transverse shaft having gears for engaging said rack, feeding mechanism for said transverse shaft including a ratchet, means for operating said ratchet from said drive-shaft, means for locking said ratchet at each actuation thereof, manually-operated means for throwing said ratchet out of action, and manual device for returning said feed-table to initial position, as and for the purposes set forth.

15. In a machine of the class described, wad cutting and plating and shell-cripping devices, means for actuating the same, a feed-carriage, ratchet mechanism for imparting a step-by-step advancement thereof, means for locking said ratchet at each actuation thereof and manually-actuated device for throwing said ratchet mechanism out of action at will, as and for the purposes set forth.

16. In a machine of the class described, wad cutting and plating and shell-cripping devices, means for actuating the same, a feed-carriage, ratchet mechanism for imparting a step-by-step feed thereof, means for throwing said ratchet mechanism out of action, and manual device for returning said carriage to its initial position, as and for the purposes set forth.

17. In a machine of the class described, wad cutting and plating and shell-cripping devices, means for actuating the same, a feed-carriage, feeding device therefor, means for automatically arresting the wad cutting and plating devices, said means operating in advance of the arrival of the feed-carriage at the limit of its feed movement, and means for actuating the feed-carriage at will, as and for the purposes set forth.

18. In a machine of the class described, wad cutting and plating devices, a feed-carriage, racks connected thereto, actuating-gears engaging said racks, ratchet mechanism for actuating the same, manually-actuated device for throwing said ratchet mechanism out of operation at will, and manually-actuated device for returning said carriage to its initial position, as and for the purposes set forth.

19. In a machine of the class described, the combination with a driving-shaft for operating a crimping device, of a cam on said shaft for operating a ratchet for giving movement to a carriage for holding and conveying a shell-plate, means for adjustably regulating the throw of said ratchet, and manually-actuated device for positively throwing the same out of operation at a given point, as and for the purposes set forth.

20. In a cartridge-loading machine, wad cutting and plating devices and shell-cripping device, in combination with a primary driving-shaft, connections between said primary driving-shaft and said shell-cripping device for actuating the latter, a secondary driving-shaft, connections between said secondary driving-shaft and said wad cutting and plating devices for actuating the latter, said primary and secondary shafts having gears intermeshing with each other, means for rotating said primary shaft, and means for automatically disengaging the gearing intermediate said shafts at any desired given point, whereby the primary shaft may continue to rotate after the secondary shaft has been arrested, as and for the purposes set forth.

21. In a cartridge-loading machine, wad cutting and plating devices, shell-cripping device, a primary shaft and a secondary shaft, connections between said primary shaft and shell-cripping device for actuating the latter, connections between said secondary shaft and said wad cutting and plating devices for actuating the latter, intermeshing gearing respectively carried by said shafts whereby said secondary shaft is rotated from said primary shaft, said gearing including a clutch, and means for automatically actuating said clutch at any desired given point to disengage said gearing, whereby said secondary shaft is arrested without arresting said primary shaft, as and for the purposes set forth.

22. In a machine of the class described, the combination with a secondary driving-shaft having a crank and a plunger actuated thereby, of a crank-bar or plunger, punches carried thereby, and adjustable connections between said plunger and plunger, whereby the point to which said punches descend may be varied, as and for the purposes set forth.

23. In a machine of the class described, the combination with a shaft having a crank, a plunger operated by said crank, a plunger, wad cutting and plating punches carried by said plunger, a block journaled in said plunger and provided with an eccentric projection, said eccentric projection forcing a bearing for said plunger, a handle connected to said block for adjusting the same, and means for locking said handle in adjusted position, as and for the purposes set forth.

24. In a machine of the class described, the combination with a plunger, punches carried thereby, a die-block also mounted on said plunger for movement relative thereto and through which the punches operate, a die-plate carried by said die-block, the strip of wad material being arranged to pass over said die-plate, said die-plate having openings therethrough in which said punches operate, as and for the purposes set forth.

25. In a machine of the class described, the combination with a plunger, punches carried thereby, a die-block carried by said plunger and provided with a die-plate, said die-plate and die-block provided with openings through which said punches operate, a punch-guiding and wad-stripping plate located above said die-block and die-plate, means for feeding a strip of wad material between said guiding and stripping plate and said die-plate, and means for preventing the shells in line with the openings in said die-plate and die-block, as and for the purposes set forth.

26. In a machine of the class described, a plunger, punches carried thereby, a die-block also carried by said plunger but having last-motion connection therewith, whereby when the plunger descends the die-block

will also descend until it engages the cartridge-shell when its motion will be arrested but said last-motion connection will permit the further downward movement of the plunger, whereby when the shells are presented to the action of the punches they are engaged and held in alignment by said die-block during the advancing movement of the punches, as and for the purposes set forth.

27. In a machine of the class described, a plunger, punches carried thereby, a die-block having loose or last motion connection with said plunger, means for presenting a wad-strip over said die-block, a stripping-plate through which said punches operate, and means for actuating said plunger, as and for the purposes set forth.

28. In a machine of the class described, a plunger, punches carried thereby, a die-block having passages for receiving and guiding said punches, said die-block having loose or last motion connection with said plunger and serving as an aligning-block for the shells, wad-strip-feeding mechanism and a stripper arranged over said die-block and through which the punches operate, as and for the purposes set forth.

29. In a machine of the class described, the combination with a plunger, punches carried thereby, a die-block having loose or last motion connection with said plunger whereby it may be lowered upon the shells before the punches advance, as and for the purposes set forth.

30. In a machine of the class described, the combination with a plunger, punches carried thereby, of a die-block, dotted supporting-links therefor, bolts carried by said plunger and operating in the slots in said links, thereby providing a loose or last motion connection between said plunger and die-block whereby said die-block partakes but partially of the movement of said plunger, and means for locking said die-block in its lowered position, as and for the purposes set forth.

31. In a machine of the class described, the combination with a plunger, punches carried thereby, a die-block, dotted supporting-links for said die-block, bolts carried by said plunger and operating in the slots in said links thereby providing loose or last motion between said die-block and plunger, a lock for locking said die-block in its lowered position, and means for automatically releasing said lock, as and for the purposes set forth.

32. In a machine of the class described, the combination with a wad-cutting plunger, feed-rolls arranged in advance of said wad-cutting plunger for feeding the wad-sheet, of a secondary pair of rolls located parallel with the feed-rolls and beyond the crimping-plunger, and adapted to receive the wad-sheet after having passed through the wad-cutting device, and to aid in drawing said wad-sheet forward and finally discharging it from the machine, as and for the purposes set forth.

33. In a cartridge-loading machine, the combination with wad cutting and plating mechanism, of feed-rolls arranged on one side thereof operating to deliver a wad-sheet to said cutting and plating mechanism, and secondary rolls located on the opposite side of said cutting and plating mechanism and adapted to receive the wad-sheet from said feed-rolls, and means whereby said secondary rolls are connected with and are actuated by and in unison with said feed-rolls, as and for the purposes set forth.

34. In a machine of the class described, the combination with wad cutting and crimping devices, of a carriage moving in guideways, located in the table of the machine, and means for adjusting said guideways to take up wear, as and for the purposes set forth.

35. In a machine of the class described, wad cutting and crimping devices, actuating means therefor, a feed-carriage, a step adjustably mounted upon said carriage, a clutch device for connecting and disconnecting the actuating means of said wad cutting and crimping devices, and connections actuated by said adjustable step for disconnecting said clutch automatically when the carriage arrives at the limit of its movement, as and for the purposes set forth.

36. In a machine of the class described, a main drive-shaft and a secondary shaft, gearing for driving the latter from the former, a plunger carrying punches, connections operated from said secondary shaft for actuating said plunger, a second plunger carrying a crimping mechanism operated by said main shaft for operating said second plunger, and means for automatically arresting said secondary shaft in advance of the arrest of said main shaft, as and for the purposes set forth.

37. In a machine of the class described, a main shaft, a secondary shaft, gearing for driving the latter from the former, wad cutting and plating devices actuated by said secondary shaft, shell-cripping devices actuated from said main shaft, a carriage, means actuated by said main shaft for advancing said carriage, a clutch for disconnecting said secondary shaft from its actuating-gearing, a step mounted on said carriage, and means actuated by said step for automatically disconnecting said clutch, whereby said wad cutting and plating devices are arrested without arresting the feed action of said carriage or the actuation of said shell-cripping devices, as and for the purposes set forth.

38. In a machine of the class described, of a carriage for containing a shell-plate, means for registering and firmly holding the plate on said carriage, guides in which said carriage operates, an adjustable stop mounted on said car-

ring, and mechanism operated by said stop for arresting said wad-placing device without arresting said crimping device, as and for the purpose set forth.

39. In a machine of the class described, the combination with a shell-plate carriage, a feed-rack connected thereto, a transverse shaft having a gear thereon arranged to mesh with said feed-rack, means for automatically rotating said shaft periodically to advance said carriage step by step, including a ratchet mounted on said transverse shaft, manually-actuated devices for throwing said ratchet out of operation at will to arrest the advancing movement of said carriage and to permit the return thereof to initial position, and stops arranged to limit the forward and backward movements of said carriage whereby when said automatic step-by-step feed mechanism is thrown out of action said carriage is prevented from being advanced or retreated sufficiently to disengage the gear on said transverse shaft from said rack, as and for the purpose set forth.

40. In a machine of the class described, the combination with a drive-shaft, wad cutting and inserting and shell-crimping device, of a carriage for holding and conveying the shells, racks located underneath said carriage and meshing in pinions on a shaft operated by means of a pawl and ratchet connected with the driving-shaft, whereby a step-by-step movement is imparted to said carriage, and at such times as the wad-cutting and shell-crimping device are lifted from the shells, as and for the purpose set forth.

41. In a machine of the class described, the combination with a shell-feeding carriage, of a ratchet mechanism for operating the same, an operating-pawl and a locking-pawl for said ratchet, means for automatically lifting the locking-pawl at the moment the driving-pawl starts to move the ratchet forward, and manually-actuated device for raising said pawls out of action at will, as and for the purpose set forth.

42. In a machine of the class described, the combination of a shell-feeding carriage, a ratchet including a drive-pawl for operating the carriage, a locking-pawl, and means for lifting the driving-pawl and means actuated by the lifting or driving pawl for automatically lifting the locking-pawl, at the will of the operator, as and for the purpose set forth.

43. In a machine of the class described, the combination with a carriage, power mechanism for operating the same, automatic device for actuating said power mechanism, means for disengaging the connection between said carriage and said power mechanism, and manual means independent of said power mechanism for moving said carriage forward or backward, as and for the purpose set forth.

44. In a machine of the class described, the combination of a wad cutting and placing device, a crimping device, a releasable driving-pawl and primary driving-shaft connected with said pawl and operated by it, and having a releasable eccentric for operating the crimping device, a secondary driving-shaft releasably connected with and operated by said primary shaft by means of a releasable gear, adjustable means for regulating the stroke of said wad cutting and placing device, a die-block connected with the plunger and partaking in part of its movement, wad-punches operating through said die-block, releasable means for holding the die-block while the punches are being withdrawn, rollers for feeding the wad material, and corresponding rolls to receive it, connections actuated by the secondary driving-shaft for operating these parts, a carriage for conveying the shell-plate, mechanism including racks and pinions, ratchet and pawl, and connected with and operated step by step by the primary shaft for actuating said carriage, adjustable stops on said carriage by which the secondary shaft is arrested and the eccentric on said primary shaft is released, means for positively arresting the carriage at each of its movements and finally at the completion of the movements in either direction, means for disconnecting the carriage from the operation of the machine and means for moving it in either direction at the will of the operator, and adjustable guides for said carriage, as and for the purpose set forth.

45. In a machine of the class described, wad cutting and placing device, a shell-feeding carriage, driving mechanism for said wad cutting and placing device including a clutch, a trip, connections actuated thereby and operating to disengage said clutch, means for maintaining said trip under tension and said connections out of operative position with respect to said clutch, and a stop carried by said carriage for releasing said trip-retaining means, as and for the purpose set forth.

46. In a machine of the class described, wad cutting and placing device, an actuating-shaft therefor, a clutch for rendering said shaft inoperative, a trip, connections actuated thereby for disengaging said clutch, means for retaining said trip under tension and said connections out of operative position, a stop for automatically releasing said retaining means, and auxiliary manual device for releasing said trip at will, as and for the purpose set forth.

47. In a machine of the class described, a plunger carrying wad cutting and placing punches, and means for actuating the same, in combination with a guiding and aligning die-block carried by said plunger and having or least motion connection therewith to permit of movement relative

thereto, and a detachable lock for said die-block, as and for the purpose set forth.

48. In a machine of the class described, a plunger, wad cutting and placing punches carried thereby, a die-block carried by said plunger and having loose or lost motion connection therewith to permit of movement relative thereto, a locking-lever for locking said block in the limit of its movement, and means carried by said plunger for releasing said locking-lever, as and for the purpose set forth.

702,153. ELECTRICAL CONTROLLING APPARATUS. EDWARD F. PLATT, Louisville, Ky., assignor to Joseph McWilliams and Company, Louisville, Ky., a Corporation of Kentucky. Filed Feb. 20, 1902. Serial No. 95,990. (No model.)

Claim.—1. The combination with an electric motor and a fluid moving device operated thereby, of an electric stopping and starting device in circuit with the motor, provided with controlling means for controlling the speed of the motor after it has been started, and a fluid-pressure motor controlling said means for controlling the speed of the motor controlled by the pressure produced by said fluid moving device.

2. The combination with an electric motor and a fluid moving device operated thereby, of a solenoid in circuit with the motor, a contact-arm controlled by the magnetic core of the solenoid, resistance for controlling the motor controlled by the contact-arm, and a fluid-pressure motor controlling the magnetic core of the solenoid and controlled by the pressure produced by said fluid-moving device, whereby the motor is started by the solenoid and its speed is controlled by the movement of the magnetic core and contact-arm under the control of the fluid-pressure motor.

3. In controlling apparatus for the purpose described, the combination with an electric motor and a fluid moving device operated thereby, of an electric controller for controlling the speed of the electric motor, means to automatically throw said controller into "off" position when the circuit is open, a fluid-pressure motor controlling said electric controller and controlled by the pressure produced by said fluid moving device, and means to permit said controller to return to the "off" position, when the circuit is open, independently of the pressure acting on said pressure-motor.

4. In controlling apparatus for the purpose described, the combination with the electric motor and fluid moving device operated thereby, of an electric controller for controlling the speed of the electric motor, means to automatically throw said controller to the "off" position when the circuit is open, a cylinder communicating with said fluid moving device, a piston in the cylinder controlled by the pressure produced in the cylinder by the fluid moving device, and a loose connection between said controller and the piston, whereby said controller may return to the "off" position, when the circuit is open, independently of the pressure acting on said pressure-motor.

5. In controlling apparatus for the purpose described, the combination with an electric motor and a fluid moving device operated thereby, of an electric controller for controlling the speed of an electric motor, means to automatically throw said controller to the "off" position when the circuit is open, a cylinder communicating with said fluid moving device, a piston in the cylinder controlled by the pressure produced in the cylinder by the fluid moving device, and a loose connection between said controller and the piston, whereby said controller may return to the "off" position, when the circuit is open, independently of the pressure acting on said pressure-motor.

is open, a cylinder communicating with the said fluid moving device, a piston in said cylinder controlled by the pressure produced in the cylinder by the fluid moving device, a rod in connection with a moving part of the controller and extending through the piston and loosely connected therewith by the head or nut, and a spring acting on the piston.

6. In a controlling device for the purpose described, the combination of a solenoid and its magnetic core, a moving contact-arm operatively connected with the magnetic core, a fluid-pressure motor operatively connected with the magnetic core and adapted to control it by the pressure acting on said motor, an electric circuit embracing said solenoid, and an electric circuit embracing resistance-contacts controlled by said contact-arm.

7. In a controlling device for the purpose described, the combination of a solenoid and its magnetic core, a movable contact-arm operatively connected with the magnetic core, a fluid-pressure motor operatively connected with the magnetic core and adapted to control it by the pressure acting on said motor, an electric circuit embracing resistance-contacts controlled by said contact-arm, a spring acting on said contact-arm and adapted to return it to "off" position when the circuit through the solenoid is open, and means to permit the magnetic core to return, when said circuit is open, independently of the pressure acting on said pressure-motor.

702,158. TREATMENT OF ORES AND MATERIALS CONTAINING ANTIMONY. JAMES F. VAN DER PLOEG, The Hague, Netherlands. Filed June 25, 1901. Serial No. 65,967. (No specimens.)

Claim.—1. The herein-described method of extracting antimony from ores, materials or residues containing it, consisting in finely pulverizing the material, mixing it with a suitable quantity of powdered quicklime and then mixing it with an adequate quantity of acid of an alkali-earth metal and water, so as to form a solution of the lower and most soluble double sulfide as being the best electrolyte without the use of artificial heat or application of pressure.

2. The herein-described process of obtaining antimony from ores, materials, or residues containing it, consisting in finely pulverizing the material, mixing it with a suitable quantity of powdered quicklime and then mixing it with an adequate quantity of acid of an alkali-earth metal and water, so as to form a solution of the lower and most soluble double sulfide as being the best electrolyte without the use of artificial heat or application of pressure, and then extracting antimony from said solution.

3. The herein-described method of extracting antimony from ores, materials or residues containing it, consisting in finely pulverizing the material mixing it with a suitable quantity of powdered quicklime and then mixing it with an adequate quantity of acid of an alkali-earth metal and water so as to form a solution of the lower and most soluble double sulfide as being the best electrolyte without the use of artificial heat or application of pressure winning the antimony from said acid solution as a metal by electrolysis and then using several times the solution from which the antimony has been separated for treating new quantities of ores or materials containing antimony as until the antimony contents are practically completely extracted from the ores or materials containing antimony under treatment, new quantities of quicklime and acid of an alkali earth metal being added according to the nature of the antimony compound.

702,154. TABLE-TENNIS NET. JAMES E. GORDON and WILLIAM C. GORDON, Liverpool, England. Filed Mar. 2, 1902. Serial No. 97,261. (No model.)

Claim.—1. A table-tennis net comprising a set of two or more separate pieces of wirework which can be placed alongside each other and caused to overlap, with means for holding them together with sufficient rigidity so as to adjust the length of the net to fit different-size tables.

2. A table-tennis net consisting of two rectangular frames filled in with wire-netting, appliances for securing them together, such frames being provided with feet or supports which when in use are at right angles to the network, but can be turned so as to be in line therewith and pack in a small compass, substantially as set forth.

3. A table-tennis net, comprising two rectangular frames, one having

ing a bottom hook and the other a top hook, to respectively overlap each other, and a series of winging supports for the rectangular frames; substantially as described.

702,155. ELECTRIC MOTOR. HAROLD ROYDEN, Chicago, Ill., assignor to Otto Elevator Company, New York, N. Y., a Corporation of New Jersey. Filed Nov. 22, 1900. Serial No. 797,900. (No model.)

Claim.—1. The combination with a car, a hoisting-cable therefor, a drum over which said hoisting-cable operates, of a motor having its armature and field mounted in rotative relation in opposite directions, said drum connected to one of said parts, means for driving one of said parts, and means for maintaining the rotation of the armature and field at different speed ratios, as and for the purpose set forth.

2. The combination with a car and a hoisting-drum therefor, of a motor having its armature and field mounted for rotation in opposite directions, said drum connected to one of said parts, driving mechanism for one of said parts, and a controlling-lever on the car, circuits therefor, whereby the speed ratios of rotation of the armature and field are varied, as and for the purpose set forth.

3. The combination with an electric motor having its armature and field independently revolvable, a drum connected to one of said parts, and means for maintaining the rotation of the armature and field at different speed ratios, as and for the purpose set forth.

4. The combination with a car, a hoisting-drum therefor, of an electric motor having its armature and field independently revolvable, said hoisting-drum connected to one of said parts, and means carried by the car for controlling the variations in relative speed ratios in rotation of the armature and field, as and for the purpose set forth.

5. In an electric elevator, a motor having its armature and field independently revolvable, a car, hoisting connections between said car and one of said independently-revolvable parts, and means controllable from the car for maintaining the rotation of the armature and field at different speed ratios, as and for the purpose set forth.

6. In an electric elevator, a motor having its armature and field independently revolvable, a hoisting-drum connected to one of said independently-revolvable parts, a car, hoisting connections between said car and drum, and means controllable from the car for maintaining the rotation of the armature and field at different speed ratios, as and for the purpose set forth.

7. The combination with an electric motor having its armature and field independently revolvable, of means for varying the relative speed of said independently-revolvable parts, a drum arranged to be driven by one of said parts, a brake for said motor, and means whereby said brake is applied when the circuit of the motor is broken, as and for the purpose set forth.

8. In an electric elevator, a car, a hoisting-motor therefor, said motor having an independently-revolvable armature and field, hoisting connections between the car and one of said parts, and means for varying

the relative speeds of the armature and field to vary the speed of the car, as and for the purpose set forth.

9. In an electric elevator, a car, a hoisting-motor therefor, said motor provided with an independently-revoluble armature and a field, hoisting mechanism between the car and one of said parts, and means from the car for varying the relative speed of the armature and field to vary the speed of the car, as and for the purpose set forth.

10. In an electric elevator, a car, a hoisting-motor therefor, said motor provided with an armature and a field, arranged for independent rotation, hoisting connections between the car and one of said parts, and means controllable from the car for varying the speed of the car, as and for the purpose set forth.

11. In an electric elevator, a hoisting-motor having an independently-revoluble armature and a field, a car, connections between said car and one of said parts, and means controllable from the car for varying the speed and direction of rotation of one of said parts with reference to the other, as and for the purpose set forth.

702,156. MITER-JOINT FOR EAVES-TROUGHS. THOR RYE, Minnesota, Minn., assignor of one-half to W. A. Grove, Minnesota, Minn. Filed Feb. 25, 1902. Serial No. 95,554. (No model.)

Claim.—1. An eaves-joint involving an elbow-section, and cooperating trough-sections which trough-sections extend at an angle to each other, are directly united at one edge, and are adapted to overlap with the ends of said elbow, substantially as described.

2. An eaves-joint comprising the elbow-section 4 with raised inner portion 5, and the trough-section 1 having the rolled band 2 and cut transversely at 3 and bent at right angles, which sections are adapted to be put together, substantially as described.

3. An eaves-joint comprising the elbow-section 4 with inner raised portion 5 and clenching-lips 6, and the trough-section 1 having the rolled rib 2, cut transversely at 3 and bent at right angles, which trough-sections are adapted to be put together, substantially as described.

702,157. RELIEF-VALVE. FRANK SCHMIDT, Mansfield, Ohio. Filed Oct. 7, 1901. Serial No. 77,905. (No model.)

Claim.—1. In a relief-valve a casing having an inlet and an outlet opening, a main valve therein normally closing the outlet-opening having an enlarged upper end contacting the walls of the casing and forming therewith a closed chamber above the valve, said chamber having a slot in its walls situated above the normal position of the upper end of the valve and placing the chamber in communication with the interior of the casing, substantially as shown and described.

2. In a relief-valve a casing having an inlet and an outlet opening, a main valve therein normally closing the outlet-opening having an enlarged upper end contacting the walls of the casing and forming therewith a closed chamber above the valve, said chamber having a slot in its walls situated above the normal position of the upper end of the valve and placing the chamber in communication with the interior of the casing, and a hand-wheel having its stem passing through the casing and engaging the main valve for lifting it from its seat when desired, substantially as shown and described.

gaging the main valve for lifting it from its seat when desired, substantially as shown and described.

3. In a relief-valve the combination of a casing having an inlet and an outlet opening, a main valve therein seated against the outlet-opening and consisting of a shell having an internal flange and an upper enlarged end contacting the walls of the casing and forming therewith a closed chamber above the valve, said chamber having a slot in its walls situated above the normal position of the end of the valve and placing the chamber in communication with the interior of the casing, a secondary valve to be seated downward against the internal flange of the main valve and a light spring for raising it from its seat, substantially as shown and described.

702,158. COMBINED BUSTLE AND HIP-FORM. CHARLES H. SHUTT, Chicago, Ill. Filed Oct. 17, 1901. Serial No. 78,912. (No model.)

Claim.—1. As an improved article of manufacture, a bustle and hip-form comprising a covering substantially semicircular in shape and filling therein, the said filling being tapered to a feather-edge at all of its edges, the cover and filling being tapered so that one side of the cover will be contracted, whereby the device may be reversed and two different sized and shaped concave-convex forms produced, substantially as described.

2. As an improved article of manufacture, a bustle and hip-form comprising a covering composed of two pieces connected together at their edges, each of said pieces having in its upper portion a circular recess and in its lower portion a series of ribs connected together at their edges, filling having all of its edges tapered and beveled between said pieces, and the whole formed so that it may be reversed and two different sized and shaped concave-convex forms produced, substantially as described.

702,159. JOURNAL-BOX. JOHN F. SUTHERLAND, Leonard, Ohio. Filed Jan. 27, 1902. Serial No. 91,305. (No model.)

Claim.—In a journal-box, the combination with a box-body 1 having a dust-guard compartment in its inner end portion and a journal-receiving opening therein, of a dust-guard comprising a main section 9 and a yielding or movable section 11 slidably mounted therein, and curved bearing-segments secured in oppositely-located recesses of said dust-guard sections, said bearing-segments having beveled end portions which are adapted to overlap each other and being of such width as to extend in front and in rear of the dust-guard body, substantially as specified.

702,160. CLAMP PARTICULARLY ADAPTED FOR SECURING FITTINGS TO THE FRAMES OF CYCLES. FREDERICK H. HARRISON, London, England. Filed Apr. 1, 1902. Serial No. 101,066. (No model.)

Claim.—1. In a clamp the combination of a strap adapted to encircle a support, means to permit the overlapping of the ends of the strap without their lying one upon the other, a projection on one end of the strap, a lever pivoted to the other end and adapted to operate against the projection as a fulcrum so that tension is put upon the strap, means for turning the lever upon its fulcrum, means for retaining the lever in its operative position and means for securing an article to the clamp substantially as set forth.

2. In a clamp the combination of a strap adapted to encircle a support, means to permit the overlapping of the ends of the strap without their lying one upon the other, a projection on one end of the strap, a lever pivoted to the other end and adapted to operate against the projection as a fulcrum so that tension is put upon the strap, means for turning the lever upon its fulcrum, a stop against which the lever is brought by

the tension put on the strap and means for securing an article to the clamp substantially as set forth.

3. In a clamp the combination of a strap adapted to encircle a support, means to permit the overlapping of the ends of the strap without their lying one upon the other, a projection on one end of the strap, a lever pivoted to the other end and adapted to operate against the projection as a fulcrum so that tension is put upon the strap, means for positioning the base of the fulcrum so that the line of tension passes between it and the support clamped by the clamp, means for turning the lever upon its fulcrum, a stop to limit the movement of the lever in one direction and means for securing an article to the clamp substantially as set forth.

4. In a clamp the combination of a strap adapted to encircle a support, a forked end to the strap adapted to receive the other end, a projection on one end of the strap, a lever pivoted to the other end and adapted to operate against the projection as a fulcrum so that tension is put upon the strap, means for positioning the base of the fulcrum so that the line of tension passes between it and the support clamped by the clamp, means for turning the lever about its fulcrum, a stop to limit the movement of the lever in one direction and means for securing an article to the clamp substantially as set forth.

5. In a clamp the combination of a strap adapted to encircle a support, a lug on one end of the strap and forming a continuation of it, a jaw on the lug to receive the free end of the strap, a projection on each end of the jaw approximately at right angles to the face of the free end of the strap, a lever pivoted to the free end of the strap and adapted to operate against the projections as a fulcrum so that tension is put upon the ends of the strap, a shoulder on the projections so positioned that the line of tension is made to pass between the fulcrum and the support clamped by the clamp, a recess in the lever to permit the passage of the strap when fixing the clamp, means for turning the lever upon its fulcrum, a stop to limit the movement of the lever in one direction and means for securing an article to the clamp substantially as set forth.

6. In a clamp the combination of a strap adapted to encircle a support, a lug on one end of the strap and forming a continuation of it, a jaw on the lug to receive the free end of the strap, a projection on each end of the jaw approximately at right angles to the face of the free end of the strap, a lever pivoted to the free end of the strap and adapted to operate against the projections as a fulcrum so that tension is put upon the ends of the strap, a shoulder on the projections so positioned that the line of tension is made to pass between the fulcrum and the support clamped by the clamp, a recess in the lever to permit the passage of the strap when fixing the clamp, an article secured to the lever of the clamp and a stop to limit the movement of the clamp in one direction substantially as set forth.

709,161. WINDMILL. GILBERT R. SNOW, Esq., III., assignor to High Wind Power and Pump Company, Esq., III., a Corporation of Illinois. Filed July 1, 1891. Serial No. 66,622. (No model.)

Claim.—1. In a windmill, the combination of a wind-wheel shaft, an inner hub or mounting and an outer hub or mounting on the wind-wheel shaft, spokes or arms radiating from the inner hub or mounting, an inner and an outer rim, both rims continuous and each rim having a horizontal flange and a vertical flange, both rims attached each by its vertical flange to the radiating spokes or arms, and radial diagonal braces extending from the outer hub or mounting to the inner rim and attached to the hub or mounting and to a flange of the outer rim, the braces alternating with the arms or spokes, substantially as described.

2. In a windmill, the combination of a wind-wheel shaft, an inner hub or mounting and an outer hub or mounting on the wind-wheel shaft, spokes or arms radiating from the inner hub or mounting, an inner and an outer rim, both rims continuous and each rim having a horizontal flange and a vertical flange, both rims attached each by its vertical flange to the radiating spokes or arms, radial diagonal braces extending from the outer hub or mounting to the outer rim, and attached to the hub or mounting and to a flange of the outer rim, the braces alternating with the arms or spokes, and fans attached to the outer and inner rims, substantially as described.

3. In a windmill, the combination of a wind-wheel shaft, an inner hub or mounting and an outer hub or mounting on the wind-wheel shaft, each hub or mounting having a center and radial ears or brackets extending from the center, arms or spokes attached at their inner ends to the ears or brackets of the inner hub or mounting, an outer and an inner rim, both rims continuous and each rim having a horizontal flange and a vertical flange, both rims attached each by its vertical flange to the arms or spokes, and diagonal braces attached at their inner ends to the ears or brackets of the inner hub or mounting and attached at their outer ends to the vertical flange of the outer rim, the braces alternating with the arms or spokes, substantially as described.

4. In a windmill, the combination of a wind-wheel shaft, an inner hub or mounting and an outer hub or mounting on the wind-wheel shaft,

each hub or mounting consisting of a center, radial ears or brackets and a plate or facing connecting the ears or brackets, arms or spokes attached at their inner ends to the ears or brackets of the inner hub or mounting and to the facing, an outer rim and an inner rim, both rims continuous and each rim having a horizontal flange and a vertical flange, both rims attached each by its vertical flange to the arms or spokes, and diagonal braces attached at their inner ends to the ears or brackets and the facing of the inner hub or mounting and attached at their outer ends to the vertical flange of the outer rim, the braces alternating with the arms or spokes, substantially as described.

5. In a windmill, the combination of a wind-wheel shaft, an inner hub or mounting and an outer hub or mounting on the wind-wheel shaft, each hub or mounting consisting of a center, radial ears or brackets and a plate or facing connecting the ears or brackets, arms or spokes attached at their inner ends to the ears or brackets of the inner hub or mounting and to the facing, an outer rim and an inner rim, both rims continuous and each rim having a horizontal flange and a vertical flange, both rims attached each by its vertical flange to the arms or spokes, diagonal braces attached at their inner ends to the ears or brackets and the facing of the outer hub or mounting and attached at their outer ends to the vertical flange of the outer rim, the braces alternating with the arms or spokes, and fans attached to the outer and inner rims, substantially as described.

6. In a windmill, the combination of a horizontal main frame or support having on its upper face an extended box or bearing for the wind-wheel shaft and an extended box or bearing for the gear-shaft, the two boxes or bearings arranged side by side in a horizontal plane, a fixed arm upwardly and outwardly extending from the main frame or support, and a vibratable arm or lever pivotally mounted at its inner end on the fixed arm and having an upward, forward and lateral projection for connection with a wheel or disk on the gear-shaft and a lower forward continuation for connection with a pump-rod for giving the pump-rod its reciprocating movements, substantially as described.

7. In a windmill, the combination of a horizontal main frame or support having on its upper face an extended box or bearing for the wind-wheel shaft and an extended box or bearing for the gear-shaft, the two boxes or bearings arranged side by side in a horizontal plane, a fixed arm upwardly and outwardly extending from the main frame or support, a vibratable arm or lever pivotally mounted at its inner end on the fixed arm and having an upward, forward and lateral projection, a pitman connecting the lateral end of the vibratable arm or lever with the disk or wheel on the gear-shaft, and a lower forward extension of the vibratable arm or lever for attachment thereto of the pump-rod, substantially as described.

8. In a windmill, the combination of a horizontal main frame or sup-

port having an extended box or bearing for the wind-wheel shaft and an extended box or bearing for the gear-shaft, the two boxes or bearings arranged side by side in a horizontal plane, a fixed arm upwardly and outwardly extending from the main frame or support, a wind-wheel shaft mounted in the box or bearing therefor on the main frame or support, a pinion on the wind-wheel shaft, a gear-shaft mounted in the box or bearing therefor on the main frame or support and having a disk or wheel in mesh with the pinion of the wind-wheel shaft, a vibratable arm or lever pivoted at its inner end on the fixed arm of the main frame or support and having an upward, forward and lateral projection, a pitman connecting the disk or wheel with the lateral end of the vibratable arm or lever, and a lower forward extension of the vibratable arm or lever for attachment to the pump-rod, substantially as described.

9. In a windmill, the combination of a horizontal main frame or support having an extended box or bearing for the wind-wheel shaft and an extended box or bearing for the gear-shaft, the two boxes or bearings arranged side by side in a horizontal plane, a fixed arm upwardly and outwardly extending from the main frame or support, a wind-wheel shaft mounted in the box or bearing therefor on the main frame or support, a pinion on the end of the wind-wheel shaft, a gear-shaft mounted in the box or bearing therefor on the main frame or support, a disk or wheel on the end of the gear-shaft in mesh with the pinion of the wind-wheel shaft, a vibratable arm or lever pivoted at its inner end on the fixed arm of the main frame or support and having an upward, forward and lateral projection, a pitman pivotedly connected with the disk or wheel of the gear-shaft and with the lateral end of the vibratable arm or lever, a lower forward extension on the vibratable arm or lever for attachment to a pump-rod, and a pump-rod reciprocated by the movement of the arm or lever, substantially as described.

10. In a windmill, the combination of a bearing-head at the top of the tower, a horizontal main frame or support mounted on the bearing-head and having a box or bearing for the wind-wheel shaft and a box or bearing for the gear-shaft, the two boxes or bearings arranged side by side in a horizontal plane, a fixed arm outwardly and upwardly extending from the main frame or support, a vibratable arm or lever pivoted at its inner end on the fixed arm and having an upward, forward and lateral projection for connection with the gear wheel or disk on the gear-shaft, and a lower forward extension for connection with the pump-rod for reciprocating the pump-rod, substantially as described.

11. In a windmill, the combination of a bearing-head at the upper end of the tower, a horizontal main frame or support mounted on the bearing-head and having a box or bearing for the wind-wheel shaft and a box or bearing for the gear-shaft, the two boxes or bearings arranged side by side in a horizontal plane, a fixed arm upwardly and outwardly extending from the main frame or support, a wind-wheel shaft mounted in the box or bearing therefor on the main frame or support, a pinion on the end of the wind-wheel shaft, a gear-shaft mounted in the box or bearing therefor on the main frame or support, a disk or wheel on the gear-shaft in mesh with the pinion of the wind-wheel shaft, a vibratable arm or lever pivoted at its inner end on the fixed arm and having an upward, forward and lateral projection, a pitman connecting the projecting lateral end of the vibratable arm or lever with the disk or wheel of the gear-shaft, a forward extension of the vibratable arm or lever in line with the pump-rod, and a pump-rod connected to the extension of the vibratable arm or lever, substantially as described.

12. In a windmill, the combination of a bearing-head at the upper end of the tower, a horizontal main frame or support mounted on the bearing-head and revolvable thereon and having a box or bearing for the wind-wheel shaft and a box or bearing for the gear-shaft, the two boxes arranged side by side in a horizontal plane and parallel one with the other, a fixed arm upwardly and outwardly extending from the main frame or support, a wind-wheel shaft mounted in the box or bearing therefor on the main frame or support, a gear-shaft mounted in the box or bearing therefor on the main frame or support, a disk or wheel on the gear-shaft in mesh with the pinion of the wind-wheel shaft, a vibratable arm or lever pivoted at its inner end on the fixed arm and having an upward, forward and lateral projection for connection with the disk or wheel gear shaft and a forward extension for connection with the pump-rod for reciprocating the pump-rod, substantially as described.

13. In a windmill, the combination of a main frame or support, a rock-shaft mounted on the main frame or support, an arm on the rock-shaft for turning the vane to throw the mill out of the wind, a second arm on the rock-shaft for advancing and rearing a brake block or head with the end of turning the vane to throw the mill out of the wind, a slidable horizontal brake block or head, connected with and operated from the second arm of the rock-shaft and a center or hub for a wind-wheel and having a convoluted face engaged by the acting end of the brake block or head, substantially as described.

14. In a windmill, the combination of a main frame or support, a rock-shaft mounted on the main frame or support, an arm on the rock-

shaft for turning the vane to throw the mill out of the wind, a second arm on the rock-shaft, a rod connected with the second arm, a coil-spring encircling the rod, a slidable horizontal brake block or head connected with the rod, and a hub or center for a wind-wheel having a convoluted face engaged by the acting end of the brake block or head in turning the vane to throw the wheel out of the wind, substantially as described.

702,182. METHOD OF FORMING SPONGE SUBSTITUTES. ALEXANDER STRAIN, New York, N. Y. Filed Nov. 5, 1901. Serial No. 81,394. (No specimen.)

Claim.—1. The method of forming a sponge substitute, which consists in incorporating with rubber a sufficient quantity of a chemically-acting cell-forming solvent of rubber to only partially dissolve said rubber, and heating said compound to form cells therein and vulcanize the rubber.

2. The method of forming a sponge substitute, which consists in incorporating with rubber a sufficient quantity of a chemically-acting cell-forming hydrocarbon to only partially dissolve said rubber, and heating said compound to form cells therein and vulcanize the rubber.

3. The method of forming a sponge substitute, which consists in incorporating with rubber a sufficient quantity of paraffin to partially dissolve said rubber, and heating said compound to form cells therein and vulcanize the rubber.

4. The method of forming a sponge substitute, which consists in incorporating with a sulfurized rubber compound a sufficient quantity of a chemically-acting cell-forming hydrocarbon to partially dissolve said rubber, and heating said compound to form cells therein and vulcanize the rubber.

5. The method of forming a sponge substitute, which consists in incorporating with a sulfurized rubber compound a sufficient quantity of a chemically-acting cell-forming hydrocarbon to partially dissolve said rubber, adding a sufficient quantity of water or other liquid to distill the cells of said rubber, and heating said compound to form other cells therein and vulcanize the rubber.

6. The method of forming a sponge substitute, which consists in incorporating paraffin with rubber, and heating said compound to form cells therein and vulcanize the rubber.

7. The method of forming a sponge substitute, which consists in incorporating paraffin and water or other moistening ingredient with rubber, and heating said compound to form cells therein and vulcanize the rubber.

8. The method of forming a sponge substitute, which consists in incorporating with sulfurized rubber a hydrocarbon capable of partially dissolving said rubber and causing a distention of the remainder, and then heating said compound to form cells therein and vulcanize the rubber.

702,183. APPARATUS FOR SPINNING ARTIFICIAL-SILK FILAMENTS FOR FORMING STRANDS OR THREADS. ROBERT W. STRANDBERG, Stockholm, Sweden. Filed Feb. 24, 1901. Serial No. 82,444. (No model.)

Claim.—1. An apparatus for making artificial silk having a reservoir of liquid in which the mouthpiece on the twisting mechanism is submerged, substantially as set forth.

2. An apparatus for making strands of artificial silk from a solution, having a mouthpiece with holes or a group of mouthpieces adapted to revolve about a common center, means for revolving said mouthpiece or mouthpieces, means for supplying the solution to said mouthpiece or mouthpieces, whereby the filaments produced from the mouthpiece or mouthpieces are twisted together in a continuous manner as fast as, and immediately after they are produced, and a reservoir containing a liquid in which said mouthpiece or mouthpieces revolve, whereby the operations are carried on in a liquid medium.

3. An apparatus for making strands of artificial silk from a solution comprising a mouthpiece with holes or a plurality of mouthpieces or groups of mouthpieces adapted to revolve about a common center, the mouthpiece or mouthpieces of each group being also adapted to revolve about a common center, means for effecting said revolutions, means for supplying the solution to said mouthpiece or mouthpieces, and a reservoir containing a fluid arranged adjacent to said mouthpiece or mouthpieces and in which the mouthpiece or mouthpieces are submerged during their operation, substantially as set forth.

4. In an apparatus for producing strands of artificial silk from a solution, the combination with a suitable frame and an annular rack 8, fixed therein, of a toothed gear-wheel, mounted rotatively in the frame concentric with the rack 8, means for rotating said gear-wheel, a cylinder or plurality of cylinders mounted rotatively in said gear-wheel and when more than one cylinder each provided with a pinion in gear with the rack 8, a mouthpiece or group of mouthpieces 6 on the end of each cylinder, and means for supplying the solution of artificial silk to the mouth-

piece or mouthpieces through the cylinder or respective cylinders, substantially as set forth.

5. In an apparatus for producing strands or artificial silk, the combination with a suitable frame and an annular rack 8, fixed therein, of a toothed gear-wheel, mounted rotatively in the frame concentric with the rack 8, means for rotating said gear-wheel, a cylinder or plurality of cylinders mounted rotatively in said gear-wheel and when more than one cylinder, each provided with a pinion in gear with the rack 8, a mouthpiece or group of mouthpieces 6 on the end of each cylinder, means for supplying the solution of artificial silk to the mouthpiece or mouthpieces through the respective cylinder or cylinders, and a reservoir 14, arranged adjacent to said mouthpiece or mouthpieces whereby they are adapted to revolve in a liquid contained therein, said reservoir having an outlet at its lower part for the thread, substantially as set forth.

6. In an apparatus for the production of strands of an artificial silk from a solution, the combination with a suitable frame, a press mounted in the same and having a plunger 12, a plate or disk 10, coupled loosely to said plate, and an annular rack 8, fixed in the frame, of a gear-wheel 2, mounted rotatively in the frame concentric with said rack, a cylinder or plurality of cylinders 5, mounted rotatively in said gear-wheel 2 and when more than one cylinder, each provided with a pinion 7, in gear with the rack 8, plungers 9 in the respective cylinder or cylinders, the plate 10 bearing thereon, means for driving the gear-wheel 2, mouthpiece or mouthpieces 6 in the ends of the cylinder or respective cylinders and supplied therewith, a liquid-reservoir 14, adjacent to and embracing the mouthpiece or mouthpieces, whereby the latter are adapted to revolve in the liquid in said reservoir, and the tube 16, connected with the lower part of the reservoir for conducting away the thread.

702,184. HAND-OUTTER AND FEEDER. PAUL SWINNEY, Hopkinton, Mass. Filed Dec. 18, 1901. Serial No. 84,000. (No model.)

Claim.—1. In a hand-outer and feeder, the combination with the rotary crank-shaft, of a cutter-bar carried by said crank-shaft and supported at its forward end by an oscillating link, and a toothed or serrated overhead feed-bar extending forward of said cutter-bar and supported at its forward end by an independently-oscillating link and pivotally connected at its rear end to said cutter-bar, substantially as described.

2. In a hand-outer and feeder, the combination with a rotary crank-shaft 8, of a plurality of cutter-bars 11 carried by said crank-shaft, links 13 pivotally connecting the forward ends of said bars 11 to an overhead support, the overhead feed-bar 15 having the extensions 17 pivoted to said cutter-bars at 19 and overlapping said links 13, and the links 16 connecting the forward ends of said bars 11 from an overhead support, substantially as described.

porting the forward ends of said bars 11 from an overhead support, substantially as described.

702,185. CORN-SHOCK COMPRESSOR. ISA B. TAYLOR, Harvard, Ill. Filed Aug. 4, 1901. Serial No. 71,208. (No model.)

Claim.—1. In a corn-shock compressor comprising two companion side or face plates, the combination of a fixed jaw on one of the plates, a movable jaw pivoted between the plates, a guide or socket for the rope directly connected with the movable jaw and furnishing the operative means for engaging and disengaging the movable jaw and locking the jaw when engaged, and a pulley-wheel over which the rope travels, substantially as described.

2. In a corn-shock compressor comprising two companion side or face plates, the combination of a fixed jaw on one of the plates, a movable jaw pivoted between the plates and having a serrated edge coacting with the face of the fixed jaw, a guide or socket directly connected with the movable jaw and through which the rope passes and furnishing the operative means for engaging and disengaging the movable jaw and locking the jaw when engaged, and a pulley-wheel over which the rope travels, substantially as described.

3. In a corn-shock compressor comprising two companion side or face plates, the combination of a fixed jaw on one of the plates, a movable jaw pivoted between the plates, a guide or socket for the rope directly connected with the movable jaw and furnishing the operative means for engaging and disengaging the movable jaw and locking the jaw when engaged, a pulley-wheel over which the rope travels, and a retaining or anchoring wire pivotally secured at one end on one of the plates, substantially as described.

4. In a corn-shock compressor, comprising two companion side or face plates, the combination of a fixed jaw, a movable jaw pivoted between the plates, a socket attached to the movable jaw and through which the rope passes and furnishing the operative means for engaging and disengaging the movable jaw and locking the jaw when engaged, a pulley-wheel over which the rope travels, and a curved retaining or anchoring wire pivoted at one end to one of the side or face plates, substantially as described.

5. The combination, in a corn-shock compressor, a tackle-block, a

compressing-rope, having a snap on its end for engaging the tackle-block and rope, a retaining or anchoring wire, pivoted at one end to the tackle-block and having an eye or loop therein adjacent to the pivotal point of the wire to the block, a retaining-spring on the snap, and a tying cord or twine threaded through the eye or loop and having its free end caught beneath the retaining-spring, for passing the tying-cord around a check or handle with the encircling of the check or handle by the compressing-rope, substantially as described.

702,166. STRAP-GRIP FOR SHAFBLING HORSES. *Am. JOHN H. WALLACE, Scrabble, Scotland. Filed Nov. 12, 1900. Serial No. 28,406. (No model.)*

Claim.—1. The combination of the buckle-frame B, the gripping-plate A hinged to said frame at one end, gripping by its free end against the opposite end of the frame and having a slot intermediate of its ends, and a strap engaging with the slotted central part of the gripping-plate so as to draw the free end thereof into engagement with the strap to be gripped, as explained.

2. The combination of the frame B, the gripping-plate A hinged at one end to the frame, formed at its free end to engage a strap passing between it and the opposite end of the frame, and having a transverse slot F intermediate of its ends; and a minable strap passing through said slot, provided with steps G to limit its rendering therethrough, so as to draw the free end of the gripping-plate into or out of engagement with the buckle-frame, as explained.

3. The combination of the buckle-frame B formed at its hinge end with a stop-shoulder d; the gripping-plate A hinged to the said frame at one end, gripping by its free end against the opposite end of the frame; engaging by its hinged end against the stop d so as to limit its opening movement, and having a slot intermediate of its ends; and a strap engaging with the slotted central part of the gripping-plate so as to draw the free end thereof into engagement with the strap to be gripped, as explained.

702,167. MACHINE FOR MANUFACTURING SOLDERED CANS. *HARRY A. WILLIAMS, Brooklyn, N. Y., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed Mar. 27, 1900. Serial No. 10,232. (No model.)*

Claim.—1. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, means for forwarding a can to a position with its corner in said solder, means for rotating said can in said position, and means for simultaneously removing superfluous solder from said can.

2. In a can-soldering machine, the combination with a molten-solder receptacle, of a runway for the cans, an intermittently-rotating notched feed-wheel for the cans, a pair of rotating and reciprocating checks or spindles bearing against the ends of the cans for automatically rotating the cans and immersing the corners thereof in the molten solder, substantially as specified.

3. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, means for forwarding a can to a position with its corner in said solder, and rotating said can in said position, and a brush adapted to bear simultaneously on the solder taken up by said can and to remove the superfluous portion thereof.

4. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, means for forwarding a can to a position with its corner in said solder and rotating said can in said position, a brush adapted to bear simultaneously on the solder taken up on the side of said can, and a brush adapted to bear simultaneously on the solder taken up on the end of said can, said brushes being adapted to remove the superfluous portions of solder taken up.

5. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, means for forwarding a can to a position with its corner in said solder and rotating said can in said position, a brush adapted to bear simultaneously on the solder taken up by said can, and means for rotating said brush to remove the superfluous portion of solder.

6. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, a runway, means for forwarding a can to a fixed point of said runway over said solder, means for moving said can axially to a position with its corner in said solder, rotating it in said position and then withdrawing it to its former position above the solder, and means for forwarding the same along said runway from its position above the solder.

7. In a can-soldering machine, the combination of a molten-solder receptacle, of a runway for the cans, an intermittently-rotating notched feed-wheel for the cans and a plurality of pairs of rotating and reciprocating checks or spindles for checking the cans endwise between them and rotating the cans and immersing the corners thereof in the solder-bath, substantially as specified.

8. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, a laterally-inclined runway, means for forwarding cans along said runway to a position over said solder, means for holding said cans within said runway while they are being forwarded to said position, and means for projecting said cans beyond the lower side of said runway and into said solder when in said position.

9. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, means for forwarding a can to a position above said solder, and means for moving said can downward into said solder and means controlled by said downward movement for rotating said can.

10. In a can-soldering machine, the combination of a receptacle for containing solder, means for liquefying said solder, means for holding a can in a position with its corner in said solder and rotating it in said position and a cover extending over the can in said position for preventing the escape of heat.

11. In a can-soldering machine, the combination of a molten-solder receptacle, of a runway for the cans, an intermittently-rotating feed-wheel for the cans, rotating checks or spindles for rotating the cans with the corners thereof in the molten solder, and a solder-removing brush, substantially as specified.

12. In a can-soldering machine, the combination of a molten-solder receptacle, of a runway for the cans, an intermittently-rotating feed-wheel for the cans, rotating checks or spindles for rotating the cans with the corners thereof in the molten solder, and a pair of solder-removing brushes embracing the corner of the cans, substantially as specified.

13. In a can-machine, the combination of a rotative spindle, a non-rotative brush-support thereon, a solder-removing brush on said support, means for connecting a can to said spindle whereby said can is rotated, said brush bearing against said can when the latter is connected to said spindle, and means for rotating said spindle.

14. In a can-machine, the combination of a rotative and longitudinally-movable spindle, a non-rotative brush-support carried by said spindle, a solder-removing brush on said support projecting beyond the end of said spindle, means for pressing a can into contact with said brush and against the end of said spindle, and means whereby said pressure rotates said spindle.

15. In a can-machine, the combination of a pair of solder-removing brushes, means for holding a can in a fixed position in which one of said brushes bears on the lower end of the can-body and the other on the outer edge of the can-head, means for rotating said can in said position, and a molten-solder bath or receptacle in which the corner of the can is immersed as it is rotated, substantially as specified.

16. In a can-machine, the combination of a pair of solder-removing brushes, means for holding a can in a fixed position in which one of said brushes bears on the lower end of the can-body and the other on the outer edge of the can-head, means for rotating said can in said position in a direction to bring the solder toward the corner of the can, and a molten-

solder bath or receptacle in which the corner of the can is immersed as it is rotated, substantially as specified.

17. In a can-machine, the combination of solder-removing brushes, means for holding a can in a fixed position in which one of said brushes bears on the lower end of the can-body and the other on the outer edge of the can-head, means for rotating said can in said position in a direction to brush the solder toward the corner of the can, means for rotating said can in said position, and a molten-solder bath or receptacle in which the corner of the can is immersed as it is rotated, substantially as specified.

18. In a can-machine, the combination of a series of rotative spindles and a single brush-support on said spindles whereby said brush-support is held stationary when said spindles are rotated, a solder-removing brush on said support, and means for rotating said spindles.

19. In a can-machine, the combination of a solder-removing brush, means for forwarding cans to a position in contact with said brush, means for rotating said cans when in said position, and a cover extending over the cans in their rotating position.

20. In a can-machine, the combination of a solder-removing brush, means for forwarding cans to a position in contact with said brush, means for rotating the cans in said position, a runway for directing the cans to said position, and a cover extending over said runway and over the rotating position of the cans.

21. In a can-machine, a solder-removing brush, means for moving a can inward and from said brush, and rotating said can, and means for pressing said brush toward said can so as to remain in contact therewith while said can is being moved in a direction away from said brush.

22. The combination of a runway for the cans, of an intermittently-rotating feed-wheel for the cans, a pair of rotating and reciprocating checks or spindles for grasping and rotating the cans mounted on the stationary frame of the machine, and a solder-removing brush also mounted on the frame of the machine, substantially as specified.

23. The combination of a runway for the cans, of an intermittently-rotating feed-wheel for the cans, a pair of rotating and reciprocating checks or spindles for grasping and rotating the cans mounted on the stationary frame of the machine, and a pair of solder-removing brushes embracing the corners of the rotating cans, substantially as specified.

24. The combination of a runway for the cans, of an intermittently-movable can-body feeder, a plurality of pairs of rotating checks or spindles for grasping and rotating a plurality of cans and mounted on the stationary frame of the machine, and a solder-removing brush, substantially as specified.

25. The combination of a runway for the cans, of an intermittently-movable notched wheel for feeding the cans, and a pair of rotating, opening and closing checks or spindles bearing against the ends of the cans, a molten-solder vessel, and means for alternately moving the feed-wheel and rotating the can checks or spindles, substantially as specified.

26. The combination of a runway for the cans, of an intermittently-rotating notched feed-wheel for the cans, a pair of rotating checks or spindles to grasp and rotate the cans, a molten-solder bath or receptacle, and means for alternately actuating said feed-wheel and said rotating checks or spindles, substantially as specified.

27. In a can-machine, in combination a pair of laterally-immovable spindles opposite each other, means for introducing a can between and into contact with the adjacent ends of said spindles, and means for rotating said spindles.

28. In a can-machine, in combination a runway, a forwarding device consisting of a wheel having notches in its circumference adapted to receive and hold said cans, a can-rotating device consisting of a pair of spindles adapted to embrace said cans between their ends, and means controlled by the pressure of one of said spindles toward the other for rotating said spindles, and means for alternately rotating said notched wheel to introduce a can between said spindles and pressing one of said spindles toward the other to embrace said can and rotate the same.

29. The combination with a runway for the cans, of an intermittently-movable can-body-feed wheel, a pair of opening and closing rotating checks or spindles for grasping and rotating a can between them mounted on the stationary frame of the machine, a molten-solder bath or receptacle, means for reciprocating one of said checks or spindles, and means for communicating rotary motion to one of said spindles, substantially as specified.

30. The combination with a molten-solder bath or receptacle, of a laterally-inclined runway for the cans, an intermittently-movable feeder for the cans, and a pair of rotating and reciprocating checks or spindles for grasping and rotating the cans and projecting its corner beyond the lower side of the runway into the molten solder, substantially as specified.

702,168. SIDE-SHAF-SOLDERING MACHINE. *HARRY A. WILLIAMS, Brooklyn, N. Y., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed May 2, 1900. Serial No. 10,232. (No model.)*

Claim.—1. In an apparatus for soldering seams, the combination of a molten-solder receptacle and a reciprocating bar therein for applying a coating of solder to a seam, and separate means for molting said coating of solder and pressing it into said seam.

2. In an apparatus for soldering seams, the combination of a molten-solder receptacle and a reciprocating bar therein for applying a coating of solder to a seam, an iron, means for heating the same, and means for pressing said iron and seam together and simultaneously giving them a relative movement so as to melt the solder and wipe the seam.

3. In an apparatus for soldering seams the combination of a reciprocating solder-applying iron, a molten-solder receptacle in which said iron moves up and down for applying said iron with molten solder, means for bringing the solder on said iron into contact with a seam to apply a coating of solder thereto, and means for remelting said coating of solder and pressing it into said seam.

4. In an apparatus for soldering seams the combination of a reciprocating solder-applying iron, a molten-solder receptacle in which said iron moves up and down for applying said iron with molten solder, means for bringing the solder on said iron into contact with a seam to apply a coating of solder thereto, a second iron, means for heating the same, and means for pressing said second iron and seam together and giving them a relative movement so as to remelt the solder and wipe said seam.

5. The combination with a receptacle for molten solder, of means for supporting a can-body above such molten solder, and a vertically-reciprocating longitudinally-grooved bar in said receptacle for applying a portion of such molten solder to said can-body.

6. The combination with a receptacle for molten solder, of means for supporting a can-body above such molten solder, a vertically-reciprocating iron, and means for moving said iron into the solder to receive a supply thereof and upward to bring its supply of solder into contact with the can-body.

7. The combination with a receptacle for molten solder, of means for supporting a can-body above such molten solder, a vertically-reciprocating iron, and means for moving said iron upward to bring its supply of solder into contact with the can-body and downward away from said can-body while said can-body is stationary.

8. The combination with a receptacle for molten solder, of means for supporting a can-body above such molten solder, a vertically-reciprocating trough-shaped iron, and means for moving said iron into the solder to receive a supply thereof and upward to bring its supply of solder into contact with the can-body.

9. The combination with a receptacle for molten solder, of means for supporting a can-body above such molten solder, an iron, a support on which said iron is pivotally mounted, and means for reciprocating said support to move said iron into the solder to receive a supply thereof and upward to bring its supply of solder into contact with the can-body.

10. A solder-applying tool comprising a bar and a support therefor, said bar pivoted in said support, in combination with a molten-solder receptacle in which said tool moves up and down, substantially as specified.

11. A solder-applying tool comprising a trough-shaped bar R, and a support therefor, said bar pivoted in said support, in combination with a molten-solder receptacle in which said tool moves up and down, substantially as specified.

12. The combination of a horn F, bars W carrying pawls V, and means for reciprocating said bars to advance a series of can-bodies intermittently along said horn, a molten-solder receptacle and a vertically-reciprocating solder-applying bar in said receptacle.

13. The combination of an iron, a molten-solder receptacle for supplying said iron with molten solder in which said iron is mounted to move up and down, a horn adapted to carry a can-body, and means for moving said iron to bring the solder thereon into contact with said can-body, said horn being cut away to avoid receiving solder from said iron when there is no can thereon.

14. In an apparatus for soldering seams, the combination of a molten-solder receptacle and a reciprocating bar therein for applying solder to both sides of a seam, and separate means for melting said solder and pressing it into said seam on both sides.

15. In an apparatus for soldering seams, the combination of a molten-solder receptacle and a reciprocating bar therein for applying solder to both sides of a seam, a pair of irons opposite each other, means for heating the same, and means for pressing said irons toward each other and simultaneously passing said seam between them so as to melt the solder and wipe said seam on both sides.

16. In an apparatus for soldering the side seams of can-bodies, the combination of a horn adapted to receive said can-bodies, means for advancing a can intermittently along said horn, and a molten-solder receptacle and a reciprocating bar therein for applying solder to the seam of said can at one of its resting-points.

17. In an apparatus for soldering the side seams of can-bodies, the combination of a horn adapted to receive said can-bodies, means for advancing a can intermittently along said horn, means for applying solder to the seam of said can at one of its resting-points, and means for wiping said seam while it is moving.

18. In an apparatus for soldering the side seams of can-bodies, the combination of a horn adapted to receive said can-bodies, means for advancing a can intermittently along said horn, and a molten-solder receptacle and a reciprocating bar therein for applying solder to the seam of said can at one of its resting-points, and means for sweating said seam at another resting-point.

19. In an apparatus for soldering the side seams of can-bodies, the combination of a horn adapted to receive said can-bodies, means for advancing a can intermittently along said horn, and means for applying solder to the seam of said can at one of its resting-points, means for sweating said seam at another resting-point, and means for wiping said seam while it is moving.

20. In an apparatus for soldering the side seams of can-bodies, the combination of a horn adapted to receive said can-bodies, and a rod passing through said horn axially and adapted to be attached at one end to the horn of a body-forming machine, a molten-solder receptacle and a vertically-reciprocating solder-applying bar in said receptacle.

21. In an apparatus for soldering the side seams of can-bodies, the combination of a horn adapted to receive said can-bodies, and a rod passing through said horn axially and adapted to be attached at one end to the horn of a body-forming machine, and a support for the free end of said horn adapted to permit the passage of a can-body between itself and said horn.

702,169. DREDGE-BOX. HARRY B. WILLIAMS, New York, N. Y. assignor to American Can Company, a Corporation of New Jersey. Filed Oct. 19, 1901. Serial No. 70,397. (No model.)

Claim.—1. The dredge-box comprising in combination a box A, perforated cover B, having a central opening and rotary perforated closing-plate D, having a central portion closing said central opening in the cover B and furnished with a series of integral lips projecting through the central opening in the cover, and turned or clamped to rotatably secure the plate to the cover, substantially as specified.

2. The combination with the perforated cover B having a central opening of rotary perforated closing-plate D, having a central portion closing said central opening in the cover B and having integral lips d' turned or clamped to rotatably secure the plate to the cover, said cover being provided with a counterflange to receive the plate substantially as specified.

3. The combination of perforated dredge-box, cover B having a central opening, having a counterflange to receive a rotary plate, and a rotary

plate D having a central portion closing said central opening in the cover B and having integral lips d' turned or clamped to rotatably secure the plate to the cover, said plate being also provided with upturned lips or projections for turning the plate substantially as specified.

702,170. DEVICE FOR REMOVING CORNS. GE. JAMES F. ALLISON, Chicago, Ill. Filed Aug. 2, 1901. Serial No. 70,610. (No model.)

Claim.—1. In a device for removing corns, an elastic plate flexible to tubular shape, a sheet of abrasive material adapted to be wrapped around the elastic plate, and retaining-caps slidable over the ends of the elastic plate and the ends of the abrasive material carried thereon when the same are fitted to tubular shape to clamp the abrasive material to the plate and hold the plate in contracted condition, substantially as described.

2. In a device for removing corns, a split tubular body of springy material, abrasive material mounted thereon, and retaining-caps covering and holding the ends of the tubular body and clamping the ends of the abrasive material carried thereon to the tubular body, substantially as described.

3. In a device for removing corns, a longitudinally-split plate tubular body of springy material, a sheet of abrasive material mounted thereon, and retaining-caps of tubular shape having their inner edges depressed to hold the ends of the tubular body under tension in contracted condition and clamp the ends of the abrasive material smoothly around the body, substantially as described.

4. In a device for removing corns, a longitudinally-split tubular body of springy material, a sheet of abrasive material mounted thereon so that its edges project beyond and are bent down into the longitudinally-split tubular body, and retaining-caps of tubular shape having their inner edges depressed to fit around and hold the ends of the tubular body under tension in contracted relation and to clamp the ends of the abrasive material and hold the same around the body, substantially as described.

5. In a device for removing corns, a longitudinally-split tubular body of springy material, a sheet of abrasive material mounted thereon so that its edges project beyond and are bent down into the longitudinally-split tubular body, and retaining-caps of tubular shape adapted to fit and hold the ends of the tubular body under tension in contracted condition and to clamp the ends of the abrasive material and hold the same around the body, substantially as described.

702,171. PROCESS OF MAKING PHTHALIC AND BENZOIC ACID. AUGUSTUS BRUNLER, Basel, Switzerland, assignor to Basle Chemical Works, Basel, Switzerland, a Firm. Filed Aug. 2, 1901. Serial No. 71,476. (No specimens.)

Claim.—The herein-described process for the manufacture of phthalic and benzoic acids, which consists in heating to a temperature above 200° centigrade, naphthalene derivatives with an oxidizing metallic oxide and an alkali.

702,172. PROCESS OF EFFECTING THE DRYING OF NON-DRYING OILS AND PRODUCT PRODUCED BY SUCH PROCESS. WILLIAM E. BLAKEMAN, JR., New York, N. Y. Filed Mar. 4, 1901. Serial No. 69,706. (No specimens.)

Claim.—1. The process herein described of making a paint compound possessing drying and hardening properties, which consists in combining, substantially in the proportions specified, a non-drying fatty oil and a pigment capable of forming a hard metallic soap therewith.

2. The process herein described of making a paint compound possessing drying and hardening properties, which consists in combining, substantially in the proportions specified, a non-drying fatty oil and a pigment capable of forming a hard metallic soap therewith, and adding a drier.

3. The process herein described of making a paint compound possessing drying and hardening properties, which consists in combining, substantially in the proportions specified, a non-drying fatty oil and acid of zinc.

4. The process herein described of making a paint compound possessing drying and hardening properties, which consists in combining, substantially in the proportions specified, a non-drying fatty oil and acid of zinc, and adding a drier.

5. A paint compound, possessing drying properties, composed of a

non-drying fatty oil and a pigment capable of forming a hard metallic soap therewith, combined substantially in the proportions specified.

6. A paint compound, possessing drying properties, composed of a non-drying fatty oil and a pigment capable of forming a hard metallic soap therewith, combined substantially in the proportions specified, and a drier.

7. A paint compound, possessing drying properties, composed of a non-drying fatty oil and acid of zinc, combined substantially in the proportions specified.

8. A paint compound, possessing drying properties, composed of a non-drying fatty oil and acid of zinc, combined substantially in the proportions specified, and a drier.

9. A paint compound, possessing drying properties, composed of cotton-seed oil and a pigment capable of forming a hard metallic soap therewith, combined substantially in the proportions specified.

10. A paint compound, possessing drying properties, composed of cotton-seed oil and a pigment capable of forming a hard metallic soap therewith, combined substantially in the proportions specified; and a drier.

11. A paint compound, possessing drying properties, composed of cotton-seed oil and acid of zinc, combined substantially in the proportions specified.

12. A paint compound, possessing drying properties, composed of cotton-seed oil and acid of zinc, combined substantially in the proportions specified; and a drier.

702,173. PROCESS OF IMPARTING DRYING PROPERTIES TO PIGMENTS. WILLIAM E. BLAKEMAN, JR., New York, N. Y. Filed Oct. 31, 1900. Serial No. 706,000. (No specimens.)

Claim.—1. The process herein described of imparting quicker drying properties to oil pigments, which consists in first attenuating an oxidizing-drier in a volatile vehicle, then incorporating such attenuated drier with a pigment, and then evaporating the vehicle.

2. The process herein described of imparting quicker drying properties to oil pigments, which consists in first attenuating an oxidizing-drier in a volatile vehicle, then incorporating such attenuated drier with a pigment, then evaporating the vehicle, and then grinding the pigment in oil.

3. The process herein described of imparting quicker drying properties to oil pigments, which consists in first attenuating a salt of manganese in a volatile vehicle, then incorporating the same with a pigment, and then evaporating the vehicle.

4. The process herein described of imparting quicker drying properties to oil pigments, which consists in first attenuating a salt of manganese in a volatile vehicle, then incorporating the same with a pigment, then evaporating the vehicle, and then grinding the pigment in oil.

5. The process herein described of imparting quicker drying properties to zinc-white pigment, which consists in first attenuating an oxidizing-drier in a volatile vehicle, then incorporating such attenuated drier with the zinc-white, and then evaporating the vehicle.

6. The process herein described of imparting quicker drying properties to zinc-white pigment, which consists in first attenuating an oxidizing-drier in a volatile vehicle, then incorporating such attenuated drier with the zinc-white, then evaporating the vehicle, and then grinding the pigment in oil.

7. The process herein described of imparting quicker drying properties to zinc-white pigment, which consists in first attenuating a salt of manganese in a volatile vehicle, then incorporating the same with the zinc-white, and then evaporating the vehicle.

8. The process herein described of imparting quicker drying properties to zinc-white pigment, which consists in first attenuating a salt of manganese in a volatile vehicle, then incorporating the same with the zinc-white, then evaporating the vehicle, and then grinding the pigment in oil.

9. As a new article of manufacture, a dry pigment having an oxidizing-drier combined therewith, substantially in the proportions specified.

10. As a new article of manufacture, a dry pigment composed of zinc-white and having an oxidizing-drier combined therewith substantially in the proportions specified.

11. As a new article of manufacture, a dry pigment having a salt of manganese combined therewith, substantially in the proportions specified.

12. As a new article of manufacture, a dry pigment composed of zinc-white and having a salt of manganese combined therewith before grinding it in oil, substantially in the proportions specified.

702,174. PROCESS OF TREATING PIGMENTS FOR PAINTS. WILLIAM E. BLAKEMAN, JR., New York, N. Y. Filed Oct. 26, 1900. Serial No. 704,000. (No specimens.)

Claim.—1. The process of imparting to oil pigments, body or spread-

ing power and improved drying properties, which consists in attenuating in a volatile vehicle or vehicles, a drier and a separate body-giving agent, then incorporating such attenuated agents with the pigment, and then evaporating the vehicle.

2. The process of imparting to oil pigments body or spreading power and improved drying properties, which consists in attenuating in a volatile vehicle or vehicles, a drier and a separate body-giving agent, then incorporating such attenuated agents with the pigment, then evaporating the vehicle, and then grinding the pigment in oil.

3. The process of imparting to oil pigments body or spreading power and improved drying properties, which consists in attenuating in a volatile vehicle or vehicles, a salt of manganese and a separate body-giving agent, then incorporating such attenuated agents with the pigment, and then evaporating the vehicle.

4. The process herein described of imparting body and drying properties in oil to oil pigments, which consists in attenuating in a volatile vehicle or vehicles a drier and a paraffin-wax, incorporating such attenuated substances with the pigment, and evaporating excessive moisture before the pigment is ground in oil.

5. The process herein described of imparting body and drying properties in oil to oil pigments which consists in attenuating in a volatile vehicle or vehicles a salt of manganese and a paraffin-wax, incorporating such attenuated substances with the pigment, and evaporating excessive moisture before the pigment is ground in oil.

6. The process of imparting to oil pigments body or spreading power and improved drying properties, which consists in attenuating a drier in a volatile vehicle, incorporating the vehicle with the pigment, and evaporating the vehicle; then attenuating a separate body-giving agent in a volatile vehicle, incorporating this solution with the combined pigment and drier, and evaporating the vehicle.

7. The process of imparting body or spreading power and improved drying properties to zinc-white pigment, which consists in attenuating in a volatile vehicle or vehicles a drier and a separate body-giving agent, then incorporating such attenuated agents with the zinc-white, and then evaporating the vehicle.

8. The process of imparting body or spreading power and improved drying properties to zinc-white pigment, which consists in attenuating in a volatile vehicle or vehicles a salt of manganese and a separate body-giving agent, then incorporating such attenuated agents with the zinc-white, then evaporating the vehicle, and then grinding the pigment in oil.

9. The process of imparting body or spreading power and improved drying properties to zinc-white pigment, which consists in attenuating in a volatile vehicle or vehicles a salt of manganese and a separate body-giving agent, then incorporating such attenuated agents with the zinc-white, and then evaporating the vehicle.

10. The process herein described of imparting body and drying properties in oil to zinc-white pigment, which consists in attenuating in a volatile vehicle or vehicles a drier and a paraffin-wax, incorporating such attenuated substances with the zinc-white, and evaporating excessive moisture before the pigment is ground in oil.

11. The process herein described of imparting body and drying properties in oil to zinc-white pigment, which consists in attenuating in a volatile vehicle or vehicles, a salt of manganese and a paraffin-wax, incorporating such attenuated substances with the zinc-white, and evaporating excessive moisture before the pigment is ground in oil.

702,175. PROCESS OF MANUFACTURING PAINTS. WILLIAM E. BLAKEMAN, JR., New York, N. Y. Filed Jan. 2, 1900. Serial No. 69. (No specimens.)

Claim.—1. The process herein described, which consists in first incorporating a drier with a pigment, and then grinding the pigment in a non-drying fatty oil.

2. The process herein described, which consists in first incorporating a drier with a pigment; then grinding said pigment in a non-drying fatty oil; and then adding an additional drier.

3. The process herein described, which consists in incorporating a drier with a pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then combining the pigment and oil so treated.

4. The process herein described, which consists in first incorporating a drier with a pigment, and then grinding the pigment in a vehicle composed of a non-drying fatty oil and a drying oil.

5. The process herein described, which consists in incorporating a drier with a pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then grinding said pigment in a vehicle composed of the non-drying fatty oil so treated and a drying oil.

6. The process herein described, which consists in attenuating a drier in a volatile vehicle; incorporating such attenuated drier with a pigment; evaporating the liquid portion of the vehicle; and then grinding said pigment in a non-drying fatty oil.

7. The process herein described, which consists in first incorporating a manganese salt with a pigment, and then grinding said pigment in a non-drying fatty oil.

8. The process herein described, which consists in incorporating a manganese salt with a pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then grinding said pigment in said oil.

9. The process herein described, which consists in first incorporating a drier with a zinc-white pigment, and then grinding said pigment in a non-drying fatty oil.

10. The process herein described, which consists in first incorporating a drier with a zinc-white pigment; then grinding said pigment in a non-drying fatty oil; and then adding an additional drier.

11. The process herein described, which consists in incorporating a drier with a zinc-white pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then grinding said pigment in said oil.

12. The process herein described, which consists in first incorporating a drier with a zinc-white pigment, and then grinding said pigment in a vehicle composed of a non-drying fatty oil and a drying oil.

13. The process herein described, which consists in first incorporating a manganese salt with a zinc-white pigment, and then grinding said pigment in a non-drying fatty oil.

14. The process herein described, which consists in incorporating a manganese salt with a zinc-white pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then grinding said pigment in said oil.

15. The process herein described, which consists in incorporating a manganese salt with a zinc-white pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then grinding said pigment in said oil.

16. The process herein described which consists in incorporating a drier with a zinc-white pigment; heating a non-drying fatty oil in the presence of an oxidizer; and then grinding said pigment in a vehicle composed of said non-drying fatty oil and a drying oil.

17. The process herein described which consists in first incorporating with a zinc-white pigment a drier capable of giving spreading power to the pigment, and then grinding the pigment in a non-drying fatty oil.

18. The process herein described which consists in first attenuating in a suitable vehicle a drier capable of giving spreading power to a pigment, then incorporating said drier with a pigment, then evaporating the vehicle and then grinding the pigment in a non-drying fatty oil.

702,176. PAINT COMPOUND OR MIXTURE. WILLIAM H. BLAKEMAN, JR., New York, N. Y. Filed Dec. 14, 1899. Serial No. 740,575. (No specimens.)

Claim.—1. A paint compound or mixture composed of a non-drying fatty oil; and a pigment having a drier incorporated therewith prior to its being ground in the oil.

2. A paint compound or mixture composed of a non-drying fatty oil; a pigment having a drier incorporated therewith prior to its being ground in the oil; and a drying oil.

3. A paint compound or mixture composed of a non-drying fatty oil; a pigment having a drier incorporated therewith prior to its being ground in the oil; a drying oil; and an additional drier.

4. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; and a pigment having a drier incorporated therewith prior to its being ground in the oil.

5. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; a pigment having a drier incorporated therewith prior to its being ground in the oil; and a drying oil.

6. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; a pigment having a drier incorporated therewith prior to its being ground in the oil; a drying oil; and an additional drier.

7. A paint compound or mixture composed of a non-drying fatty oil; and a pigment having a manganese salt incorporated therewith prior to its being ground in the oil.

8. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; and a pigment having a manganese salt incorporated therewith prior to its being ground in the oil.

9. A paint compound or mixture composed of a non-drying fatty oil; and a zinc-white pigment having a drier incorporated therewith prior to its being ground in the oil.

10. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; and a zinc-white pigment having a drier incorporated therewith prior to its being ground in the oil.

11. A paint compound or mixture composed of a non-drying fatty oil; a zinc-white pigment having a drier incorporated therewith prior to its being ground in the oil; and a drying oil.

12. A paint compound or mixture composed of a non-drying fatty oil; and a zinc-white pigment having a manganese salt incorporated therewith prior to its being ground in the oil.

13. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; and a zinc-white pigment having a manganese salt incorporated therewith prior to its being ground in the oil.

14. A paint compound or mixture composed of a non-drying fatty oil treated with an oxidizer; and a zinc-white pigment having a manganese salt incorporated therewith prior to its being ground in the oil.

15. A paint compound or mixture composed of cotton-seed oil; and a zinc-white pigment having a drier incorporated therewith prior to its being ground in the oil.

16. A paint compound or mixture composed of cotton-seed oil; and a zinc-white pigment having a salt of manganese incorporated therewith prior to its being ground in the oil.

17. A paint compound or mixture composed of cotton-seed oil treated with an oxidizer; and a zinc-white pigment having a drier incorporated therewith prior to its being ground in the oil.

18. A paint compound or mixture composed of cotton-seed oil treated with an oxidizer; and a zinc-white pigment having a manganese salt incorporated therewith prior to its being ground in the oil.

19. A paint compound or mixture composed of cotton-seed oil; a zinc-white pigment having a drier incorporated therewith prior to its being ground in the oil; and a drying oil.

702,177. PIGMENT AND PROCESS OF PRODUCING SAME. WILLIAM H. BLAKEMAN, JR., New York, N. Y. Filed Aug. 6, 1901. Serial No. 71,005. (No specimens.)

Claim.—1. The process herein described, which consists in first combining with a pigment, by the aid of a liquid, a substance of lead; and then evaporating the liquid before grinding the pigment in oil.

2. The process herein described, which consists in first combining with a pigment, by the aid of a liquid, a substance of lead; then evaporating the liquid; and then grinding the pigment in oil.

3. The process herein described, which consists in first making a solution of a substance of lead; then saturating a pigment with said solution; and then evaporating the solvent before grinding the pigment in oil.

4. The process herein described, which consists in first making a solution of a substance of lead; then saturating a pigment with said solution; then evaporating the solvent; and then grinding the pigment in oil.

5. The process herein described, which consists in first combining with a pigment, by the aid of a liquid, a substance of lead; then evaporating the liquid; and then grinding the pigment in a vehicle composed of raw oil and boiled oil.

6. The process herein described, which consists in first making a solution of a substance of lead; then saturating a pigment with this solution; then evaporating the solvent; and then grinding the pigment in a vehicle composed of raw oil and boiled oil.

7. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a substance of lead; and then evaporating the liquid before grinding the pigment in oil.

8. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a substance of lead; then evaporating the liquid; and then grinding the pigment in oil.

9. As a new article of manufacture, a dry pigment having a substance of lead combined therewith.

10. As a new article of manufacture, a dry pigment composed of zinc-white having a substance of lead combined therewith.

702,178. PROCESS OF TREATING PIGMENTS AND PRODUCT PRODUCED BY SUCH PROCESS. WILLIAM H. BLAKEMAN, JR., New York, N. Y. Filed Aug. 6, 1901. Serial No. 71,004. (No specimens.)

Claim.—1. The process herein described, which consists in combining with a pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; and then evaporating the liquid.

2. The process herein described, which consists in combining with a pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in oil.

3. The process herein described, which consists in first making a solution of a lead salt and a manganese salt substantially as described; then saturating a pigment with said solution; and then evaporating the solvent.

4. The process herein described, which consists in first making a solution of a lead salt and a manganese salt substantially as described; then saturating a pigment with said solution; then evaporating the solvent; and then grinding the pigment in oil.

5. The process herein described, which consists in first combining with a pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a vehicle composed of raw oil and boiled oil.

6. The process herein described, which consists in first combining with a pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a vehicle composed of raw oil and boiled oil.

7. The process herein described, which consists in first combining with a pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a vehicle composed of raw oil and boiled oil.

8. The process herein described, which consists in first making a solution of a lead salt and a manganese salt substantially as described; then saturating a pigment with this solution; then evaporating the solvent; and then grinding the pigment in a vehicle composed of raw oil and boiled oil.

9. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a lead salt and a manganese salt, substantially as described; and then evaporating the liquid.

10. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a lead salt and a manganese salt, substantially as described; then evaporating the liquid; and then grinding the pigment in oil.

11. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a non-drying fatty oil.

12. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a non-drying fatty oil.

13. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a non-drying fatty oil.

14. The process herein described, which consists in first combining with a zinc-white pigment, by the aid of a liquid, a lead salt and a manganese salt substantially as described; then evaporating the liquid; and then grinding the pigment in a non-drying fatty oil.

15. As a new article of manufacture, a dry pigment having a lead salt and a manganese salt combined therewith.

16. As a new article of manufacture, a dry pigment composed of zinc-white having a lead salt and a manganese salt combined therewith.

702,179. ANALOGATING APPARATUS. MARCELYN BLONDE, Paris, France. Filed May 28, 1901. Serial No. 698,006. (No model.)

Claim.—1. The combination with a tank having sheet-iron sides, of vertical sheet-iron partitions arranged in the tank and dividing the same into a series of main compartments, vertical partitions E therein, dividing each main compartment into three compartments—a central compartment and lateral compartments, the bottom of the partitions E not reaching the bottom of the compartments whereby to afford communication between the lateral compartments and the central compartment, and each of said central compartments being closed at the top, an air-outlet pipe and a water-inlet pipe for each central compartment and a reservoir for the overflow of mercury in communication with each series of compartments.

2. The combination with a tank having sheet-iron sides, of vertical sheet-iron partitions arranged in the tank and dividing the same into a series of main compartments, vertical partitions dividing each main compartment into three compartments—a central compartment and lateral compartments, the bottom of the partitions E not reaching the bottom of the compartments whereby to afford communication between the lateral compartments and the central compartment, and each of said central compartments being closed at the top, an air-outlet pipe and a water-inlet pipe for each central compartment, and a reservoir for the overflow of mercury in communication with each series of compartments, and a gas-

ing arranged in each lateral compartment, and each comprising angular bars arranged in staggered relation to each other to form a vertical zig-zag fluid-passages.

3. An amalgamator comprising a tank, vertical partitions dividing it into main compartments, partitions subdividing the said compartments into three other compartments communicating at their lower parts, the central compartment of each element being closed at its upper part, an evacuating-tube for the air and an inlet-tube for the substance to be dressed for the said central compartments, a grating in each of the lateral compartments and comprising angular bars arranged in staggered relation to each other to form a vertical zig-zag conduit, a reservoir adapted to receive the excess of mercury according to the production of the amalgam, and tubes placing the central lateral compartments of the main compartments in communication with the reservoir, substantially as and for the purposes set forth.

4. The combination with a tank, of vertical partitions arranged in the latter and dividing the same into a series of compartments, each series comprising a central compartment and lateral compartments communicating with the central compartment, each of the central compartments being closed at the top, an air-outlet pipe and a water-inlet pipe for each central compartment, a reservoir for the overflow of mercury in communication with each series of compartments, electrical conductors one leading within one of the series of compartments and the other being connected with the tank, and a source of electrical energy in communication with said conductors.

702,180. CHECK. EDWARD A. BUCKNER, Lexington, Ky. Filed Feb. 8, 1901. Serial No. 98,308. (No model.)

Claim.—1. In a check, a body having a recess to receive the head of the rail, a nose carried by the body, said nose being tapered upwardly to its end, and a rail-engaging edge forming a fulcrum at the junction of the body and nose.

2. In a check, a body having a recess forming a shoulder, said recess being flared toward the rear, a nose carried by the body and tapering upwardly to its end, a fulcrum at the intersection of the body and nose, and means for securing the body to the rail.

3. In a check, two sections clamped to a rail, noses carried by the sections, and edges forming fulcrums, at the junction of the noses and bodies.

702,181. DRIP ATTACHMENT FOR DISPENSING APPARATUS. GEORGE W. BETH, Washington, D. C. Filed Dec. 9, 1901. Serial No. 98,309. (No model.)

Claim.—1. A drip attachment for faucets and the like comprising a supporting member adapted to be secured to the faucet, hanger-links having a shiftable pivotal connection with the supporting member, said shiftable pivotal connection providing an adjustment for watering purposes, and a drip-receptacle pivotally suspended from said links.

2. A drip attachment for faucets and the like, comprising a supporting member having opposite brackets provided with a series of bearing-sockets, hanger-links having pivot-ends shiftable engaging said sockets, and a drip-receptacle suspended from said links.

3. A drip attachment for faucets and the like comprising a swinging hanger, a shiftable drip-receptacle carried by the swinging hanger and having pivotal connection therewith, and a locking member also carried

by the swinging hanger coacting with the receptacle for preventing the tilting thereof.

4. A drip attachment for faucets and the like, comprising suitably supported swinging hanger-links, a drip-receptacle pivotally connected with said links and provided with catch-legs, and fastening-latches slidably mounted upon said links and having notches engaging with said legs.

702,182. CIGAR OR CIGARETTE HOLDER. CHARLES E. BRADLEY, Bangor, Me., assignor to Samuel E. Preston, Bangor, Me. Filed May 13, 1902. Serial No. 17,370. (No model.)

Claim.—A device of the kind described comprising in combination, a cigar or cigarette holder, a thumb inserted in the open end of the holder, said thumb being conical in shape, closed at its apex and having an opening adjacent to its apex, a yielding wiper secured to the outer end of the thumb and a band or ring attached to the wiper and adapted to abut against the end of the holder, substantially as shown and described.

702,183. MOLDING-PRESS. JAMES F. DOWLEY, Dartford, England, assignor to Company of Allen and Hanbury, Limited, London, England, a Corporation of Great Britain. Filed Aug. 14, 1901. Serial No. 71,900. (No model.)

Claim.—1. A press for molding tablets comprising a die, a plunger cooperating therewith, a handle consisting of a lever capable of moving to and fro past the axis of the plunger, and a link so connecting said handle directly with the plunger that the said link and handle constitute two members of a toggle whereby the plunger is caused to make two to-and-fro movements for each to-and-fro movement of the handle, substantially as set forth.

2. In a molding-press for tablets comprising a die, a plunger and a rising-and-falling die-bottom by which the molded tablets are ejected, the means described for operating the said die-bottom consisting of a lifting-rod connected with said bottom, a spring-actuated on said rod, a tappet on the plunger with which said catch is adapted to engage on its upward stroke, and an inclined fixed surface by which the said catch is thrust clear of the plunger-tappet when the upstroke is completed, substantially as herein set forth.

702,188.

702,184. MAGNETIC ORE-SEPARATOR. JOHN W. CARTER, Franklin, N. J. Filed Nov. 20, 1901. Serial No. 94,957. (No model.)

Claim.—1. In a magnetic ore-separator, the combination, with a supply-hopper, of a plurality of gangs of magnets, each gang of magnets being arranged in suitable boxes and having their poles in approximately vertical planes, said boxes disposed in step arrangement with vertical spaces between the front and rear sides of adjacent boxes, apertures secured in the front side of said boxes over the poles of said magnets, chutes supported on said boxes, means for horizontally adjusting and tilting said boxes, and means for independently adjusting said chutes in inclined position, substantially as set forth.

2. In a magnetic ore-separator, the combination of a gang of magnets enclosed in a suitable box having the poles of said magnets projecting from the front of the box, a vertically-disposed optimum secured stationary to the front of said box and over the poles of said magnets, said optimum having a resilient upper and extending rearwardly in oblique direction, a chute connected with said optimum in the same plane as the upper end of said optimum and supported on said box, and means for simultaneously adjusting said box and optimum in forward-tilted position, substantially as set forth.

3. In a magnetic ore-separator, the combination of a gang of magnets enclosed in a suitable box having the poles of the magnets projecting from the front face thereof, a chute supported on said box having an upper inclined portion arranged over said box and a vertically-disposed

lower portion arranged in front of the poles of said magnets, means for simultaneously adjusting said chute with said box, and cut-strap adjustably connecting the inclined upper portion of said chute with said box, for independently adjusting same in inclined position, substantially as set forth.

702,185. LATCH. ARTHUR CHARLES, Liège, Belgium. Filed Jan. 22, 1901. Serial No. 45,042. (No model.)

Claim.—1. An automatic safety-latch for doors, comprising a pivoted latch, a latch-catch carried by the door, and means carried by said door for successively engaging and rotating said latch and causing it to engage the catch; substantially as described.

2. An automatic safety-latch for doors, comprising a pivoted latch having a plurality of offset, inclined guides carried by the door with which the offset successively respectively engage, and a latch-catch on the door; substantially as described.

3. An automatic catch for doors comprising the pivoted latch c, having the offset or legs d, e, in combination with a door provided with inclined guides h and i, with which the offset d, e, respectively successively engage, and a latch-catch g; substantially as described.

702,186. CAR-COUPLER. JAMES A. CHASE, Detroit, Mich., assignor of two-thirds to Deumer C. Ross and Edmund D. Bremer, Detroit, Mich. Filed Jan. 14, 1902. Serial No. 98,707. (No model.)

Claim.—In a car-coupler, the combination of the draw-bar, the swinging jaw, an apertured bracket secured to and projecting beneath the bar, a laterally-reversible washer mounted upon the bracket, and the fulcrum-pin supported at its lower end upon the washer and carrying a pintle extending through the washer and bracket.

702,187. BOX FOR FOUNTAIN-SYRINGES. ARTHUR C. BOSSER, New York, N. Y., assignor to the Goodyear India Rubber Glove Manufacturing Company, New York, N. Y., a Corporation of Connecticut. Filed Feb. 14, 1902. Serial No. 94,071. (No model.)

Claim.—A box for fountain-syringes, consisting of an open box, a raised portion on the base thereof, at one end, and a trough-like frame arranged in said box above said raised portion and supported thereon, the side walls of said raised portion extending to the level of the sides of said box, said trough-like frame forming openings between its side walls and the sides of the box, substantially as set forth.

702,188. PUMPER. JOHN BLANCK, Swanton, Pa. Filed Feb. 21, 1902. Serial No. 93,845. (No model.)

Claim.—A pump comprising a plurality of blocks or cards which

equal in number the square of a predetermined number, whereby a number of blocks or cards are employed and divided into a predetermined number of equal series, the blocks of each series being separately numbered from one upwardly and being also separately or distinctively colored, substantially as shown and described.

702,189. DRAFT-BEAM FOR CARS. JONATHAN K. EVANS, Dickerson Run, Pa. Filed July 25, 1901. Serial No. 62,604. (No model.)

Claim.—1. The combination with the stringers A A, of two metal draft-beams, each beam having a top wall Q, bottom wall P parallel with the top wall, the Q, said bottom wall, top wall and the Q extending inwardly from the vertical wall, walls or abutments H bounding the pocket L for the follower-plates, perforated beams E intermediate the top and bottom walls and the ribs Q, perforated by F, and bolts G passing through the stringers and beams E; in substance as set forth.

2. The combination with the stringers A A, of two metallic draft-beams, each beam having a perforated lag S located in the rear of the pocket L for the follower-plates and adapted to form a step for a coupling-yoke, a top wall Q, a bottom wall P broken away the length of the pocket, strengthening-ribs Q extending from the pocket L to the ends of the beams, and taking the strains and blows imparted to the abutments H, and beams E between the top and bottom walls; the said beams being united by bolts

K which pass through the stop for the center-yoke, and secured in the stringers by bolts G; and the lower portion of the pocket L closed by a removable plate X detachably held in place by the bolts G, G, and nuts, which are located adjacent the pocket L; as set forth.

3. A metallic draft-beam having the top wall O, bottom wall P, perforated lug S, abutments M, pocket L open at the bottom, ribs Q, hollow space W at the front and closed by the top, bottom, end, and outside walls and by the wearing-base T, and bases R perforated for the reception of bolts G; the end of the said beam being adapted to be secured to the head-block by bolts passing through the hollow space W; as set forth.

4. Two metallic draft-beams each having a plain outer flange with a recess Y, a top wall, a bottom wall, perforated lug S, pocket L open at the bottom, ribs Q, perforated bases R, in combination with bolts K, stringers, bolts G, a removable plate X, and strain-rod J, each strain-rod being bent at the end and seated in a recess Y and the opposite end extended through the body-beam and adapted to be attached to a needle-beam.

5. The combination of the two draft-beams F, F, having substantially parallel outer flanges and horizontally-projecting walls on their inner flanges with connected shoring legs intermediate of their ends and wearing-bases at their front ends; said walls being of less width between said wearing-bases and said shoring legs than in the rear of the latter; in substance as set forth.

702,190. TOOL-HANDLER. FRANKLIN BROWN, Buffalo, N. Y., assignor to Fawcett Shaping Company, Buffalo, N. Y. Filed Aug. 2, 1901. Serial No. 70,611. (No model.)

Claim.—1. A tool-handle comprising an inclosing shell, a core arranged in the shell and having its upper end terminating within the same and separated therefrom by an intervening space, and a filling occupying said space and contained wholly within the shell, substantially as set forth.

2. A tool-handle comprising a shell which is open at its upper and lower ends, a core arranged in the shell and fitting at its lower end in the opening in the lower end of the shell while its upper part is separated from the surrounding shell by an intervening space, and a filling of molten material occupying said space, substantially as set forth.

3. A tool-handle comprising a shell, a core arranged in the shell and having its upper and split lengthwise, a wedge whereby the split parts of the core are separated, and a filling which occupies the space between the core and the surrounding shell, substantially as set forth.

4. A tool-handle comprising a shell which is open at its upper and lower ends and which has an internal shoulder around the opening in its upper end, a core arranged in the shell and fitting at its lower end into the lower opening of the shell while its upper part is split lengthwise and terminates below said shoulder, a wedge whereby the split parts of the core are separated so as to extend underneath said shoulder, and a filling which occupies the space between the shell and the core, substantially as set forth.

5. A tool-handle comprising a shell which is open at its upper and lower ends and which has an internal shoulder around the opening in its upper end, a core arranged in the shell and fitting at its lower end into the lower opening of the shell while its upper part is split lengthwise and terminates below said shoulder, a wedge whereby the split parts of the core are separated so as to extend underneath said shoulder, and a filling which occupies the space between the shell and the core and which forms an integral key extending throughout the split part of the core, substantially as set forth.

702,191. LINE-GRIP. FRANK I. FERRIS, New York, N. Y. Filed Oct. 1, 1901. Serial No. 77,390. (No model.)

Claim.—In a line-grip, comprising a plate-like body portion having openings near its ends, a nut supported in axial line with one of said openings, a clamping-screw operating in said nut, and a head on the clamping end of said screw, substantially as specified.

702,192. GAS-IGNITING OR KILN-IGNITING DEVICE. VANCE FERRIS, Paris, France. Filed Oct. 24, 1900. Serial No. 34,124. (No model.)

Claim.—In a gas-igniting device, the combination with an igniting-tube, of a cylindrical casing having a nipple at its top to receive the burner, an inlet at the bottom for gas to both the burner and the igniter, and a lateral outlet-port leading gas to the igniting-tube, an apertured plate in said casing between the burner and gas-inlet, said plate being adapted to close the lateral port for supplying the igniter, a valve on the under side of the plate for closing the gas-inlet, an electromagnet and its structure, the latter coupled to said plate for opening the gas-ports, and means for sending a current of electricity through said magnet and the igniting-wire simultaneously, substantially as set forth.

702,193. MATRESS. DAVID FRANKENTHAL, Frankfurt-on-the-Main, Germany. Filed May 22, 1901. Serial No. 61,600. (No model.)

Claim.—In a mattress in combination, a cover, two longitudinal and four transverse pockets formed therein corresponding in length respectively to the length and width of the mattress, stuff or filling material in said pockets, said pockets forming the edges of the mattress, substantially as described.

702,194. CASTING APPARATUS. HERBERT H. FRANKLIN, Syracuse, N. Y. Filed Sept. 20, 1901. Serial No. 76,913. (No model.)

Claim.—1. The combination with a sectional mold; of means for holding contiguous surfaces of sections of the mold separated during the entrance of the material to be cast and thereby permitting the escape of air from the mold, substantially as and for the purpose described.

2. The combination with a sectional mold; of means for holding contiguous surfaces of sections of the mold separated during the entrance of the material to be cast and thereby permitting the escape of air from the mold, and for moving one of the sections of the mold away from the contiguous portion of the mold and thereby permitting withdrawal of the cast article, substantially as and for the purpose specified.

3. The combination with a sectional mold; of means for forcing the material to be cast under pressure into the mold, and means for holding contiguous surfaces of sections of the mold separated during the entrance

of the material to be cast and thereby permitting the escape of air from the mold, substantially as and for the purpose set forth.

4. The combination with a sectional mold; of means for forcing the material to be cast under pressure into the mold, and means for holding contiguous surfaces of sections of the mold separated during the entrance of the material to be cast and thereby permitting the escape of air from the mold, and for moving one of the sections of the mold away from the contiguous portion of the mold and thereby permitting withdrawal of the cast article, substantially as and for the purpose described.

5. As a new article of manufacture, the herein-described sectional mold having flat or projections for separating contiguous surfaces of sections thereof during the entrance of the material to be cast, substantially as and for the purpose set forth.

702,195. SAFETY DEVICE FOR GAS-LINE. JOHN C. FURMAN, Strattonville, Pa., assignor of one-fourth to James W. Jones, Strattonville, Pa., and Irvin M. Shannon, Clarion, Pa. Filed Jan. 21, 1902. Serial No. 90,008. (No model.)

Claim.—1. A safety device for gas-line, comprising a casing in the line and having a transverse partition to form two compartments, of which one is connected with the gas-inlet and the other with the gas-outlet, a valve-seat in the said partition to establish communication between the compartments, a valve-seat in the outlet end of the casing and opening to the atmosphere, a valve-seat in the inlet end of the casing and opening to the atmosphere, valves for the said valve-seats, and a connection between the valves to hold one to its seat at the time the other is open, and vice versa, as set forth.

2. A safety device for gas-line, comprising a casing in the line and having a transverse partition to form two compartments, of which one is connected with the gas-inlet and the other with the gas-outlet, a valve-seat in the said partition to establish communication between the compartments, a valve-seat in the outlet end of the casing and opening to the atmosphere, valves for the said valve-seats, and a connection between the valves to hold one to its seat at the time the other is open, and vice versa, the said connection being in the form of a lever weighted at the end carrying the valve for the valve-seat opening to the atmosphere, as set forth.

3. A safety device for gas-line, comprising a casing in the line and having a transverse partition to form two compartments, of which one is connected with the gas-inlet and the other with the gas-outlet, a valve-

seat in the said partition to establish communication between the compartments, a valve-seat in the outlet end of the casing and opening to the atmosphere, valves for the said valve-seats, a connection between the valves to hold one to its seat at the time the other is open, and vice versa, and a resetting device under the control of the operator, for engaging the said connection to allow of resetting the valves, as set forth.

702,196. SHOE-TURNING DEVICE. GEORGE R. GARDNER, Hartford, Conn., assignor of one-half to Fred J. Hastings, Hartford, Conn. Filed Oct. 16, 1901. Serial No. 73,624. (No model.)

Claim.—1. The combination of two members adapted to hold between them the heel of a shoe, said members being reciprocal together in a fixed path, and a turning-arm held stationary with respect to said members and disposed longitudinally of the direction of movement of the said heel-holding members.

2. The combination of means for holding the heel of a shoe, said means comprising opposing members bearing on the top and bottom of the heel and side and rear turning-arms projected into the shoe, the heel-holding means and turning-arms being relatively movable and the turning-arms being disposed longitudinally of the direction of such movement.

3. The combination of a bracket, a heel-plate yieldingly contained therein, a second heel-plate movable against the first heel-plate to clamp and move the heel of a shoe, and a turning-arm carried by the bracket stationary with respect to the heel-plate thereof.

4. The combination with the vertically-movable bar d, of the heel-plate removably carried thereby, the bracket arranged to swing over said bar, the heel-plate yieldingly carried by the bracket opposite the first heel-plate, to arrange the heel of a shoe between said plates, and the turning-arm carried on the bracket stationary with respect to the heel-plate.

5. The combination of a support, a heel-plate held yieldingly thereby, a second heel-plate movable against the first heel-plate to clamp and move the heel of the shoe, and a turning-arm held stationary with respect to the heel-plate and adjacent thereto, for the purpose specified.

702,197. TUBE-MACHINE. JAMES J. GARETT, Philadelphia, Pa. Filed June 17, 1901. Serial No. 64,947. (No model.)

Claim.—1. In an apparatus for forming paper shells for dynamite sticks, the combination with the horizontally-arranged rotatable spider, or table, of means for driving same, a series of forming mechanisms carried by the spider, a series of forming-rolls in each mechanism, a former or mandrel working between the forming-rolls of each mechanism, device for rotating the former or mandrel during travel of the spider or table, of means whereby the projecting end of the rolled shell is crimped, and device for opening and closing the forming mechanisms as carried toward the delivery and feeding stations.

2. The combination with the forming mechanism, of device whereby the projecting end of the rolled shell is crimped during travel of the forming mechanism, the spring-held slide-plate carrying projecting pins, means for causing the pins to engage with the forming mechanism during a portion of its travel and firmly press down the crimped end of the shell.

3. In a machine of the character described, the combination with a rotary carrier, of mechanism mounted upon the surface thereof adapted to receive the blanks and roll the same around a mandrel or former, means

for imparting rotation to the mandrel or former, and devices arranged adjacent to the periphery of the carrier adapted to successively engage the end of the rolled shell to close the same.

3. The combination with the spider loosely mounted upon a fixed shaft, of means for imparting rotation thereto, a series of forming mechanisms carried by the spider, a mandrel or former working therein, a piston attached to the inner end of each former or mandrel, a gear rigidly attached to the fixed shaft with which mesh the piston of the former or mandrel, said piston meshing with the fixed gear so as to impart rotation to the former or mandrel during travel of the spider, and means exterior to the carrier in the path of rotation thereof whereby the projecting end of the rolled shell is crimped or closed.

5. The combination with the forming mechanism comprising a fixed and a hinged section, of a series of rolls secured within each section, a mandrel or former working between said rolls, devices whereby said former or mandrel is rotated, means for crimping the projecting end of the rolled shell, and means for automatically throwing said hinged section out of operative position.

6. The combination with the rotary carrier or spider, of a series of transverse platforms, a series of forming-rolls secured therein, a section hinged thereto and carrying a series of rolls, a mandrel or former working between said rolls, of devices whereby rotation is given to the former or mandrel during the travel of the rotary carrier, and means whereby the hinged section is opened and closed automatically.

7. The combination with a rotary carrier, of a series of transverse platforms carried thereby, and forming devices associated with said platforms, substantially as described.

8. In a machine of the character described, a former comprising a mandrel, hinged sections normally disposed around said mandrel, a plurality of rolls supported by each section and means for automatically throwing one of the sections out of operative position, substantially as described.

9. In a machine of the character described, tube-forming instrumentalities, means for conveying the same from point to point, and means supported independently of said conveying means adjacent to the edge thereof for crimping the end of the tube, substantially as described.

10. In a machine of the character described, a former comprising a mandrel, hinged sections disposed around said mandrel one above and the other beneath the same, rolls supported upon the surface of said sections, means for normally causing the hinged sections to approach, and means for throwing one of said sections up out of operative position, substantially as described.

11. In a machine of the character described, a rotary carrier, tube-forming instrumentalities supported by said carrier, end-closing means including a pin and a shiftable support therefor, and means brought into operation by the movement of the carrier for engaging the pin-support to force the pin against the end of the tube, substantially as described.

702,198. WINDOW-LOCK. SAMUEL J. GOSWORTHY, Mount Pleasant, Pa. Filed Mar. 8, 1902. Serial No. 94,804. (No model.)

Claim.—1. In a sash-lock, the combination of a window frame and sash, sash-bars rigidly secured in said window-frame, operating-rods carrying sash-bars secured upon said window-frame, a piston for simultaneously operating said operating-rods in opposite directions, rods pivoted to

said operating-rods telescoped near their center, and locking-bolts secured to said last-named rods engaging said sash-bars, substantially as described.

2. In a sash-lock, the combination of a window frame and the sash, sash-bars secured in the frame, lock-casings having a locking-bolt slidably mounted therein carried by the sash, a casing carried by the sash and having a shaft carrying a piston therein, operating-rods having sash-bars formed on their one ends engaging said piston and adapted to be simultaneously actuated thereby, centrally-pivoted rods carried by the sash with their lower ends extending into said lock-casing and engaging said locking-bolt, the upper ends of said rods being pivoted to the outer ends of said rods, and a spring mounted upon said shaft, secured thereto and to the said casing and adapted to return the said shaft to its normal position when the shaft is revolved, substantially as described.

702,199. RYELINE. MAAS W. GILM, New Bedford, Mass., assignor to Atlas Tack Company, Fairhaven, Mass., a Corporation of New Jersey. Filed July 20, 1901. Serial No. 70,114. (No model.)

Claim.—As an improved article of manufacture, the cylinder composed of a tubular body having uniform thickness, and a curved flange having a greater thickness, said curved flange on its upper side and separated from the body by a narrow groove, as and for the purpose specified.

702,200. LUMBER-MEASURE. JOHN GEMER, Rome, N. C., assignor of one-half to J. J. T. ROSS, Rome, N. C. Filed June 10, 1901. Serial No. 65,982. (No model.)

Claim.—1. The combination with a saw mill-carriage head-block and knee; of a scale appropriated to a certain length of leg and bearing indicating-marks respectively defining each distance of the knee from the plane of the saw as, multiplied by the length of leg appropriated to each scale, will have as product an even whole number of feet.

2. The combination with a saw mill-carriage head-block and knee; of a shiftable gage having a series of scales each appropriated to a certain length of leg and each scale bearing indicating-marks respectively defining each distance of the knee from the plane of the saw as, multiplied by the length of leg appropriated to each scale, will have as product an even whole number of feet.

3. The combination with a saw mill-carriage head-block and knee, and a pointer carried by the knee; of a series of scale-lines appropriated to bearings on the head-block and having a series of scale-lines appropriated to various lengths of legs, numerals indicating each length and stamped respectively adjacent said lines, each scale adapted to coast with said pointer and bearing indicating-marks respectively defining each distance of the knee from the plane of the saw as, multiplied by each numeral, will have as product an even whole number of feet.

4. The combination with a sawmill-carriage head-block and knee, and a pointer carried by the knee; of a series of interchangeable rollers removably journaled in bearings on the head-block and having a series of scale-lines appropriated to various lengths of legs, numerals indicating each length and stamped respectively adjacent said lines, each scale adapted to coast with said pointer and bearing indicating-marks respectively defining each distance of the knee from the plane of the saw as, multiplied by each numeral, will have as product an even whole number of feet.

5. The combination with a sawmill-carriage head-block and knee, and a pointer carried by the knee; of a series of rollers each removably journaled in bearings on the head-block and having a series of scale-lines appropriated to various lengths of legs, numerals indicating each length and stamped respectively adjacent said lines, each scale adapted to coast with said pointer and bearing indicating-marks respectively defining each distance of the knee from the plane of the saw as, multiplied by each numeral and by the thickness of the material appropriated to that roller, will have as product an even whole number of feet.

702,201. COMPRESS AND PACKER. JOHN B. GRIFFIN and SAMUEL C. ANDERSON, Van Alstyne, Tex. Filed Nov. 13, 1901. Serial No. 32,654. (No model.)

Claim.—1. A compressor and packer comprising a pressing-head, a reciprocating frame, two series of pressing-rollers carried in said frame, two endless feeding-aprons mounted to swing back and forth, flexible flaps on the aprons, and batter-rollers above said aprons, substantially as specified.

2. A compressor and packer, comprising a frame, a hydraulic press arranged in said frame, swinging holding-plates on said frame at the front and rear for engaging with a bat, spring connections between said plates, a reciprocating frame, two series of rollers carried by said frame, the inner adjacent rollers of the two series being considerably spaced apart, bars mounted on the frame and having recesses, bearing-rollers engaging in said recesses and bearing in the upper side of the reciprocating frame, swinging arms extended down between said inner rollers, and endless feeding-aprons carried by the arms, substantially as specified.

3. A cotton compressor and packer, comprising a frame, a hydraulic press arranged in said frame, a reciprocating frame, means for causing the back-and-forth movements of the reciprocating frame, two series of pressing-rollers carried by said frame, the inner adjacent rollers of the two series being considerably spaced apart, swinging arms, hangers on said arms extended downward between the said inner adjacent rollers, blocks mounted to swing in the hangers, rollers having bearings in said blocks, rollers in the upper portion of the machine-frame, endless aprons extending around the upper and lower rollers, and batter-rollers arranged above the said aprons, substantially as specified.

4. A cotton compressor and packer comprising a frame, a hydraulic

press arranged in the frame, a reciprocating frame, two series of pressing-rollers mounted in said reciprocating frame, a fixed rack, gears on the rollers for engaging with said rack, holding-plates mounted to swing, a spring connection between the plates, the two inner rollers of the series being spaced apart to permit the plates to swing upward between them, crank-wheels, and connections between the wrist-pins of said crank-wheels and the reciprocating frame, substantially as specified.

5. A cotton compressor and packer comprising a frame, batter and feed rollers at the upper portion of the frame, one of said rollers having its bearings in adjustable boxes, rollers arranged in the frame below the first-named rollers, arms mounted to swing on the frame, blocks mounted to swing on the lower ends of said arms, rollers having bearings in said blocks, endless aprons extended around the said rollers and the rollers above them, a reciprocating frame, two series of pressing-rollers arranged in said reciprocating frame, a press arranged on the frame below the pressing-rollers, and means for causing the movements of the reciprocating frame, substantially as specified.

702,202. ROOFING-TILE. ALBERT GUTHER, Bonn, Germany. Filed Nov. 17, 1900. Serial No. 28,917. (No model.)

Claim.—A quadrangular roofing-tile having on one portion flanges with an inner and an outer interposed groove, a projection and groove on opposite side edges of the tile, a prolongation at the upper end of the inner groove, a hook on the opposite side of the upper end of the tile, and projections arranged below the same, substantially as specified.

702,203. CAKE-PAN. BERTHA HAYTER, Boston, Ma. Filed Feb. 21, 1902. Serial No. 26,194. (No model.)

Claim.—In a cake-pan, the wall 6 having the opening 8 formed through the wall, and leaving the narrow strip 9 at its lower edge, the bottom 5 secured to the wall 6 and having the flange 12 projecting upwardly parallel with the strip 9, the Z-shaped bar 10 secured to the wall 6 some distance above the opening 8, the slide 11 mounted between the strip 9 and the flange 12 and between the Z-bar 10 and the wall 6, the beads 13 and 14 formed upon the ends of the slide, the handles 15 and 16 secured to said beads, and the steps 17 and 18 secured to the wall to limit the motion of the slide, substantially as specified.

702,204. HINGE-JOINT FOR CONNECTING ROD-SECTIONS. FREDERICK A. E. HAMILTON, Beverly, Mass., assignor, by direct and mesne assignments, to HARRY HUNT, Boston, Mass. Filed May 3, 1901. Serial No. 24,872. (No model.)

Claim.—1. In a lock hinged joint, an upper member including a hinge-piece which has a neck extending downward and terminating in a ball; a lower socket member having a bushing adapted to receive said neck and ball, said bushing having an inwardly-projecting flange and a lateral opening; a sleeve adapted to move freely on the upper member,

and to drop onto and engage with the said lower member whereby the two members are locked together, substantially as and for the purpose set forth.

2. In a lock hinge-joint, an upper member having a hinge-piece which has a neck terminating in a ball, and also has a broad annular groove adapted to receive said ball; a lower member adapted to receive said neck and ball; a sleeve having an annular groove also adapted to receive said ball; said sleeve adapted to work in said groove; and screw-threads upon said sleeve and lower member adapted to engage with each other and to lock the members together, substantially as and for the purpose set forth.

703,905. PROCESS OF MAKING PAPER. JOHN R. HANCOCK, East Walpole, Mass., assignor to F. W. Bird and Son, East Walpole, Mass., a firm. Filed Sept. 20, 1901. Serial No. 78,187. (No model.)

Claim.—1. In the process of paper-making, dividing a web of unfinished paper into longitudinal strips prior to drying the same.

2. In the process of paper-making taking a web of paper from the last machine-roll, dividing each web into longitudinal strips and subjecting each strip to the action of heated surfaces or cylinders.

3. In the process of paper-making that intermediate step, in a continuous process which consists in cutting an unfinished web into strips and subjecting said strips simultaneously to a drying medium.

4. In the process of paper-making dividing a web of paper containing moisture into a series of longitudinal strips and subsequently expelling the moisture from the strips simultaneously.

702,206. CIGARETTE-MACHINE. JACOB C. HANSEN-ELLSHANSSEN, Copenhagen, Denmark. Filed June 3, 1901. Serial No. 68,721. (No model.)

Claim.—1. In cigarette machinery, the combination with a table having a pocket and cooperating mold, of a filter-feed mechanism, a plunger arranged to traverse the pocket in the table, a reciprocating plunger-frame in which the plunger is slidably mounted, means for giving movement to the plunger in one direction with relation to the plunger-frame, means for actuating the plunger-frame, and a filter-cutting knife having its active edge disposed above the similar face of the plunger.

2. In cigarette machinery, the combination with a table having a pocket, and a filter-feeding mechanism, of cooperative mold, one of which is movable relative to the other, means for opening and closing said mold, a reciprocating plunger-frame, means controllable by the mold-actuating device for depressing the plunger-carrying frame when the molds are opened, a plunger yieldably mounted in the plunger-carrying frame, and a filter-cutting knife.

3. In cigarette machinery, the combination of a table provided with a pocket, a filter-feed mechanism disposed in cooperative relation to said table and arranged to form a layer of filter material of appropriate thick-

ness across said table and to the pocket therein, a plunger arranged to traverse the pocket in said table, a cutter movable with said plunger and adapted to sever a length of filter material from the layer on said table, means for actuating said plunger and the cutter, and coating means in operative relation to the table.

4. In cigarette machinery, the combination of a table provided with a pocket, cooperating mold in active relation to said table, a filter-feed mechanism disposed to form a layer of filter material of appropriate thickness across said table and to the pocket therein, means movable relative to said table, a yieldable plunger actuated by the means and adapted to traverse the pocket, a cutter controlled by said means and adapted to cover a length of filter material from the layer on said table, a hand-lever having operative connection with the plunger and cutter-carrying levers, and means connected with said carrying-levers to normally hold them, the plunger, and the cutter, in raised position.

5. In cigarette machinery, the combination of a table provided with a vertical pocket, cooperating mold in active relation to said table, a filter-feed mechanism disposed to form a layer of filter material of appropriate thickness across said table and to the pocket therein, a yieldable-mounted plunger arranged to traverse said pocket, and a knife movable with said plunger into and from the pocket, and having its active edge normally occupying a position raised above the under face of said yieldable plunger.

6. In cigarette machinery, the combination of a table provided with a pocket, cooperating mold in active relation to said table, a filter-feed mechanism disposed to form a layer of filter material of appropriate thickness across said table and to the pocket therein, a reciprocating frame normally contained above said table, suitable means for positively actuating said frame, a plunger yieldably mounted in said frame and arranged to traverse the pocket in the table, and a knife carried by the frame and adapted to be moved with the plunger to and from the pocket of the table.

7. In a cigarette-machine, the combination with a feed-table and a filter-compressing mechanism, of a traveling apron movable around a suitable guide and having upper and lower lengths which diverge from said table, separate drums on which are coiled said upper and lower lengths of the apron and means for imparting intermittent feed motion to said apron.

8. In a cigarette-machine, the combination with a table and a filter-compressing mechanism, of a guide-roller adjacent to said table, a traveling apron fitted to the roller and having its upper length arranged to deposit tobacco upon the table, a drum on which the upper length of the apron is wound, another drum adapted to receive the lower length of the apron, and means for rotating one of said drums.

9. In a cigarette-machine, the combination with a table and a filter-compressing mechanism, of a guide adjacent to said table, a drum, an apron coiled on said drum and having engagement with said guide to co-

operate an operative relation to the table, a take-up drum on which the idle portion of the apron is coiled, and automatic feed mechanism for intermittently turning the take-up drum.

10. In a cigarette-machine, the combination with a filter-compressing mechanism and a feed-apron, of a drum on which the operative length of the apron is wound, a take-up drum receiving the idle length of said apron, means for intermittently turning the take-up drum, and a brake mechanism adapted to have engagement with the supply-drum and to release the latter on the operation of the feed mechanism for the take-up drum.

11. In a cigarette-machine, the combination with a filter-compressing mechanism and a traveling feed-apron, of a feed-drum for said apron, and a brake mechanism in operative relation to the feed-drum and controlled by the filter-compressing mechanism to release the apron feed-drum when said filter-compressing mechanism is open to receive a charge of tobacco.

12. In a cigarette-machine, the combination with a filter-compressing mechanism and a feed-apron, of a feed-drum for said apron, and connections between the brake mechanism and the filter-compressing mechanism.

13. In a cigarette-machine, the combination with a filter-compressing mechanism and an apron, of a take-up roller on which the idle length of the apron is coiled, a pawl-and-ratchet feed mechanism for turning the said take-up roller, and operative connections between the filter-compressing mechanism and the ratchet of said feed mechanism, whereby the take-up roller is rotated when the filter-compressing mechanism is closed upon a charge of tobacco.

14. In a cigarette-machine, the combination with a filter-compressing mechanism, an apron, a feed-drum for said apron and a take-up roller for the apron, of a feed-rod operated by connections with the filter-compressing mechanism, a brake normally in active engagement with the apron feed-drum and controllable by said feed-rod, and a feed mechanism engaging with the take-up roller and having operative connection with said feed-rod.

15. In a cigarette-machine, the combination with a slidable mold, a feed-apron, and suitable drums for the operative and idle lengths of the said apron, of a feed-rod provided with a shoulder, a pawl actuated by the slidable mold, a pawl-and-ratchet feed mechanism for turning the said take-up roller, and a plunger having operative connections with the pawl-and-ratchet, as and for the purpose described.

16. In a cigarette-machine, the combination, with a feed-apron and a feed-drum therefor, of a brake-lever having means for engagement with said feed-drum, a feed-rod slidable relative to said brake-lever and provided with a bushing, and a collar engaging adjustably with said bushing and having operative relation to the brake-lever.

702,207. REIN-SUPPORT. SAMUEL R. HARRIS, Wabash, Ind. Filed July 22, 1901. Serial No. 68,185. (No model.)

Claim.—In a rein-support, the combination of the end bar, a rein-supporting prong secured to one of said bars, side bars secured in said end bar, a central bar integral with one side bar extending therefrom and reaching almost to the opposite side bar, whereby said rein-support is secured to a strap by means of inserting said strap edgewise between said central bar and said side bar, and securely held in position by said side bars, substantially as described.

702,208. CARTRIDGE. WILLIAM E. HATYER, Springfield, Ohio. Filed Feb. 25, 1902. Serial No. 68,621. (No model.)

Claim.—1. In a cartridge, the combination with a firing-head, of a cylinder of powder, a projectile, and stays or coupling-bars rigidly connected to the projectile and detachably secured to the firing-head.

2. A cartridge comprising a firing-head having prongs, a charge of powder, a projectile, and stays or coupling-bars rigidly secured to the projectile and detachably secured to the firing-head through the medium of the prongs.

3. A cartridge comprising a firing-head having prongs, a charge of

powder, a projectile having dovetailed recesses, and stays or coupling-bars having their outer ends dovetailed and their inner ends recessed.

4. A cartridge comprising a firing-head having prongs, a cylinder of powder having longitudinal recesses, a projectile, a stem upon said projectile having a reduced portion, and stays or coupling-bars having their outer ends dovetailed and provided near their inner ends with recesses.

702,209. CIGARETTE-MACHINE. HENRY C. BRIDGEMAN, Philadelphia, Pa., assignor to James A. Brunner, Philadelphia, Pa. Filed May 18, 1902. Serial No. 717,664. (No model.)

Claim.—1. The combination in a cigarette-machine, of a mold in which a cigarette is formed, means for rocking said mold back and forth between a filling and a discharging position, and devices for feeding a strip of wrapper-paper, said feeding device being independent of the movement of the mold, substantially as specified.

2. The combination in a cigarette-machine, of a mold in which the cigarette is formed, means for rocking said mold back and forth between a filling and a discharging position, mechanism for feeding a strip of wrapper-paper, and clearing devices for said strip independent of the mold, substantially as specified.

3. The combination in a cigarette-machine, of a mold in which the cigarette is formed, with a device independent of the mold for feeding a strip of wrapper-paper, said feeding device consisting of a rotating segment having a friction-surface for acting upon and carrying forwardly the paper strip, substantially as specified.

4. The combination of a cigarette-mold having a sliding discharger, a friction-plate in one side of the mold bearing upon said discharger, a spiral spring acting upon said plate and contained in a hollow box on the side of the mold, a cap acting on said spring, and a set-screw bearing upon said cap, substantially as specified.

5. The combination in a cigarette-machine, of primary and secondary molds, and means for rocking the same back and forth throughout a portion of a turn, whereby, when in one extreme position, they will register with each other, means for pressing a bunch of tobacco and a wrapper into the primary mold, means for folding the wrapper around the bunch as the mold swings from one position to the other, and means for pushing the partially-formed cigarette from the primary mold into the secondary mold and thereby further folding the wrapper around the cigarette, substantially as specified.

6. The combination in a cigarette-machine, of a pair of molds and means for rocking the same back and forth throughout a portion of a turn so that they will register with each other when in one extreme position, means for feeding a bunch of tobacco and a wrapper into the primary

mold when the same is in one extreme position, a wedge for folding the wrapper around the bunch of tobacco as the primary mold moves from one extreme position to the other, and means for pushing the partially-wrapped bunch from the primary mold into the secondary mold and thereby still further folding the wrapper around the same, the wedge being so disposed as to further fold the wrapper around the cigarette as the secondary mold swings from its receiving position, substantially as specified.

7. The combination in a cigarette-machine, of primary and secondary molds, means for forcing a bunch of tobacco and a wrapper into the primary mold, means for pushing the partially-formed cigarette from the primary mold into the secondary mold, a tucker-mold operating in conjunction with said secondary mold, and means for transferring the cigarette from said secondary mold to said tucker-mold, substantially as specified.

8. The combination in a cigarette-machine, of a primary mold, a secondary mold, means for pushing a bunch of tobacco and wrapper into said primary mold, means for pushing the partially-formed cigarette from the primary mold into the secondary mold, a tucker-mold operating in conjunction with said secondary mold, means for pushing the cigarette from the secondary mold into the tucker-mold, and means for ejecting the cigarette from said tucker-mold, substantially as specified.

9. The combination in a cigarette-machine, of primary and secondary molds, means for pushing the bunch of tobacco and a wrapper into said primary mold, means for pushing the partially-formed cigarette from the primary mold into the secondary mold, a tucker-mold acting in conjunction with said secondary mold, a discharger in said tucker-mold, a discharger in the secondary mold, and means for operating the latter discharger, whereby the cigarette is transferred from the secondary mold to the tucker-mold, and is confined between the two dischargers while its ends are being tacked, substantially as specified.

10. The combination in a cigarette-machine, of primary and secondary molds, means for pushing the bunch of tobacco and a wrapper into said primary mold, means for pushing the partially-formed cigarette from the primary mold into the secondary mold, a tucker-mold acting in conjunction with said secondary mold, a discharger in said tucker-mold, a discharger in the secondary mold, and a slide for operating said secondary and tucker mold dischargers, said slide having a two-stage return movement whereby the discharger of the tucker-mold will not eject the cigarette until the secondary mold has moved away, substantially as specified.

11. The combination in a cigarette-machine, of a primary mold, a secondary mold, means for pushing the bunch of tobacco and wrapper into said primary mold, means for pushing the partially-formed cigarette from the primary mold into the secondary mold, a tucker-mold operating in conjunction with said secondary mold, means for pushing a partially-formed cigarette from the secondary mold into the tucker-mold, a receiving-trough carried by the secondary-mold shaft, and means for ejecting the cigarette from the tucker-mold into said trough, substantially as specified.

12. The combination in a cigarette-machine, of primary and secondary molds having sliding dischargers, a trough on one of the mold-carriers, a trough for receiving the finished cigarette from said first trough, a pusher-bar for moving the cigarette along in said first trough, a pusher-plate for operating the mold-dischargers, and connections between said pusher-plate and pusher-bar, substantially as specified.

13. The combination in a cigarette-machine, of a rocking mold-shaft having a mold thereon, wrapper-strip feeding and covering device, and a segment mounted upon the mold-shaft and curving as a support for the wrapper-strip when the mold is moved away from the supporting position, said segment being independent of the feed mechanism, substantially as specified.

14. The combination in a cigarette-machine, of primary and final tucking-blades for the end of the wrapper, said final tucking-blade having movement around but a single axis and a lost-motion-operating device for effecting the movement of said final tucking-blade around its axis, substantially as specified.

15. The combination in a cigarette-machine, of primary and final tucking-blades for acting upon the projecting end of the wrapper, said final tucking-blade having movement around but a single axis, and gearing for connecting the shafts of the two blades, one of the elements of said gearing being a swinging dog which acts upon an arm on the shaft of the final tucking-blade throughout a portion only of its movement, substantially as specified.

16. The combination in a cigarette-machine, of primary and final tucking-blades for the end of the wrapper, said final tucking-blade having movement around but a single axis, gearing for connecting the shafts of said blades having as an element a swinging dog which acts upon an arm on the final tucker-shaft throughout a portion only of its swing, a spring for restoring said final tucker-shaft to its normal position, and a stop for arresting said return movement, substantially as specified.

17. The combination of the primary and final tucking-blades, rock-shafts carrying the same, a pinion on the primary tucker-shaft, a second pinion having a lost-motion connection with the final tucker-shaft, a duplex rack engaging with said pinions, and means for restoring said rack, substantially as specified.

18. The combination in a cigarette-machine, of a forming-mold, a rock-shaft carrying the same, mechanism for rocking said shaft, fixed stops cooperating with a shaft element for restricting the rocking movement of said shaft, and a spring tending to bring the shaft element into contact with the fixed stops at each limit of movement of the shaft, substantially as specified.

19. The combination in a cigarette-machine, of a pair of molds, each carried by a rock-shaft, whereby they can rock from and toward each other, gearing for connecting said rock-shafts, mechanism for rocking the shafts, fixed stops cooperating with an element on each shaft to restrict the rocking movement of the same, and a spring acting upon each shaft and tending to bring its stop element into contact with the fixed stops at each limit of movement of the shaft, substantially as specified.

702,910. ANTI-SHOOTING RAILWAY-TRAIN GUARD.
WILSON R. HAYDEN, Wallasey, Idaho. Filed Jan. 22, 1902. Serial No. 90,771. (No model.)

Claim.—1. A railway-vehicle provided with an anti-shooting metallic guard of considerable height and having a single beveled impact-face diagonal to the length of the train or to the railway and which face is of an extent to practically reach across the width of said vehicle.

2. A railway-vehicle provided with an anti-shooting metallic guard of a height as nearly equal to the body of the vehicle as is practicable, said metallic guard being supported on wheels and having a single beveled impact-face diagonal to the length of the train or to the railway and of an extent to practically reach across said vehicle.

3. A railway-locomotive provided with a heavy and strongly-built pilot of a height as near to the height of the locomotive as is practicable, and having a single vertical beveled front face of the height of the body of the pilot, and diagonal to the railway, and practically extending across the latter.

4. A railway-locomotive provided with a heavy and strongly-built pilot having a single vertical beveled front face diagonal to the railway and practically extending across the latter, said pilot being provided with wheels by which its considerable weight is supported.

5. A rear-end railway-guard car, for cooperation with a locomotive-pilot having a front beveled face, said car being provided with a strongly-built rear-end guard portion forming a rigid part of the car and having a single vertical beveled rear face diagonal to the railway and practically extending across the latter, said rear-end guard being of a height practically equal to the height of the body of the car.

6. A rear-end railway-guard car, for cooperation with a locomotive-pilot having a front beveled face, said car being provided with a strongly-

built rear-end guard portion constructed of metal and forming a rigid part of the car, said guard portion of said car being of a height practically equal to the height of the body of the car and having a single vertical beveled rear face diagonal to the railway and practically extending across the latter.

702,911. ANTI-SHOOTING RAILWAY-TRAIN GUARD.
WILSON R. HAYDEN, Wallasey, Idaho. Filed Jan. 22, 1902. Serial No. 90,772. (No model.)

Claim.—1. A locomotive-engine provided with an anti-shooting, heavy and strongly-constructed, pivoted, pointed pilot, with extended beveled vertical faces.

2. A locomotive-engine provided with an anti-shooting, heavy and strongly-constructed, pivoted, pointed pilot, with beveled vertical faces, combined with means for normally holding the said pilot in a central position, and means, under the control of the engineer, for swinging said pilot to either side, when desired.

3. A locomotive-engine provided with an anti-shooting, heavy and strongly-constructed, pivoted, pointed pilot, with beveled vertical faces, combined with means for normally holding the said pilot in a central position, a cylinder, a piston therein connected with said pilot, and means, under the control of the engineer, for admitting a fluid under pressure to said cylinder, for the purpose of swinging said pilot to one side or the other.

4. A locomotive-engine provided with an anti-shooting, heavy and strongly-constructed, pivoted, pointed pilot, with beveled vertical faces, combined with means for normally holding the said pilot in a central position, means, under the control of the engineer, for swinging said pilot to either side, when desired, and a rear car provided with a strongly-constructed, pointed rear guard, for cooperation with said pivoted pilot.

702,912. WHEAT-CLEANING MECHANISM. JAMES HUGHES, Liverpool, England. Filed Dec. 20, 1901. Serial No. 90,773. (No model.)

Claim.—1. In a grain-cleaning machine the combination of the upper water-chamber A, having a perforated hopper-shaped bottom, and an aperture at its side, the lower water-chamber B, pipe F for admission of water under pressure to chamber B, the grain-discharge pipe G at top of chamber A, and weighted valve O at the lower part of chamber A, whereby the grain, mud and stones are caused to fall through the valve to the bottom of chamber A where mud and stones are automatically delivered through the weighted valve to the chamber B, while the grain flows with the water over the aperture at the side of chamber A.

2. The combination with a cleaning device, of a vertical cylinder H

and H', the lower portion H' being imperforate, the upper portion H being perforate, bottom I, all set at an angle, adapted to rotate at high speed within this cylinder, and jet-pipe K placed in the perforate portion of the cylinder, substantially as and for the purpose described.

702,913. ELECTRICITY-METER. BENJAMIN C. HOLZ, Berlin, Germany. Filed Dec. 21, 1901. Serial No. 90,774. (No model.)

Claim.—1. In a meter electricity-meter in which one pressure-coil and two commutator-segments are employed, an armature, a piece of soft iron attached to said armature, a magnet disposed in such relation to said piece of soft iron as to exercise an attraction upon it to move the armature away from the dead-point position, substantially as described.

2. A meter electricity-meter, in which one pressure-coil and two commutator-segments are employed, an armature, a piece of soft iron secured to said armature, a brake-magnet, said brake-magnet being arranged in such position in relation to the piece of soft iron as to exercise an attraction upon it to move the armature away from the dead-point position, substantially as described.

3. In a meter electricity-meter in which one pressure-coil and two commutator-segments are employed, an armature, a piece of soft iron secured to said armature, a brake-magnet, said brake-magnet being arranged in such position in relation to the piece of soft iron as to exercise an attraction upon it to move the armature away from the dead-point position, a brake-disk, said brake-disk being out away at those points, which while the armature traverses the dead-angle, lie between the poles of the brake-magnet, substantially as described.

4. A meter electricity-meter in which one pressure-coil and two commutator-segments are employed, an armature, a piece of soft iron attached to said armature, a brake-magnet disposed in such relation to said piece of soft iron as to exercise an attraction upon it to move the armature away from the dead-point position, and a brake-disk out away at those points which while the armature traverses the dead-angle, lie between the poles of said brake-magnet, substantially as described.

5. In a meter electricity-meter in which one pressure-coil and two commutator-segments are employed, an armature, a piece of soft iron attached to said armature, a magnet disposed in such relation to said piece of soft iron as to exercise an attraction upon it to move the armature away from the dead-point position, and means for short-circuiting the main brushes at the moment of reversion of the current, for the purpose and substantially as hereinbefore described.

6. In a meter electricity-meter, in which one pressure-coil and two commutator-segments are employed, an armature provided on the rotating spindle, a piece of soft iron attached to said armature, a magnet disposed in such relation to said piece of soft iron as to exercise an attraction upon it to move the armature away from the dead-point position, an insulated short-circuiting piece secured to the rotating spindle, and auxiliary brushes which cooperate with said insulated short-circuiting piece to short-circuit the main brushes at the moment of reversion of the current, substantially as hereinbefore described.

702,914. STOP-CLAMP. WILLIAM F. BELL, Youngstown, Ohio. Filed Dec. 20, 1901. Serial No. 90,775. (No model.)

Claim.—1. A clamp of the character described, comprising a stem having a coupling device at one end and an engaging hook at the other, a sliding member adjustable upon the stem and provided at one end with a biting-flange adapted to work over and past the nose of the hook, and a locking member also adjustable upon the stem and adapted to work against the end of the biting-flange member opposite the biting-flange of the latter.

2. A device of the class described, comprising a stem having a coupling device at one end and an engaging hook at the other, a sliding member adjustable upon the stem and provided at one end with a biting-flange adapted to work over and past the nose of the hook, and a locking member also adjustable upon the stem and adapted to work against the end of the biting-flange member opposite the biting-flange of the latter.

into right and left threaded portions, and at one end an engaging hook provided with an inner gripping element, a sleeve binding-out engaging one of the threaded portions of the stem and provided at its outer end with an annular biting-flange designed, in its active position, to overlap and receive within itself the nose of the engaging hook, and a sleeve lock-out engaging the other threaded portion of the stem and working against the inner end of the binding-out.

3. A device of the stem described comprising a threaded stem provided with means for engaging and clamping the rope, and a separate hollow globular coupling-bush receiving and swiveling directly on one end of the threaded stem, said coupling-bush being provided with a rope-receiving opening aligned with the threaded stem, and also with a plurality of side strand-holes to permit of the knotting of the individual strands of a rope and exterior to the bush after the insertion of said rope and therein.

702,215. RAIL-JOINT. EDGAR F. HUNTER and HARRY C. HUNTER, Pittsburg, Pa. Filed Feb. 28, 1900. Serial No. 94,777. (No model.)

Claim.—1. In a rail-joint, the combination with the rails having openings formed therein, bars extending through said openings, fish-plates carrying an integral base, legs extending from said fish-plates, cross-threaded rods extending through said legs and bars, and means to fasten said cross-threaded rods, substantially as described.

2. In a rail-joint, the combination with the rails having openings formed therein, bars extending through said openings, fish-plates carrying an integral base, legs extending from said fish-plates, cross-threaded rods extending through said legs and bars, means to fasten said cross-threaded rods, and a central bolt and nut to secure said fish-plates to gather, substantially as described, and for the purpose set forth.

702,216. AUTOMATIC GAGE FOR HYDRAULIC TESTING-MACHINE. WILLIAM HERRICK, McKeesport, Pa. Filed Dec. 21, 1901. Serial No. 94,804. (No model.)

Claim.—1. In combination with a pressure-supply pipe, an automatic pressure-relieving gage comprising a tube having its lower end connected to said supply pipe and provided with a discharge-outlet intermediate its ends, a hollow cylindrical valve provided at its upper end with an arch formed integral therewith, whereby pressure is admitted both above and below the said valve and a weight-receiving rack mounted on the tube and connected to the said valve, substantially as described.

2. In combination with a pressure-supply, a tube directly connected thereto, said tube closed at its outer end and provided with a discharge-part, a cylindrical valve hollower for its entire length fitted to slide in the tube and provided at its upper end with an arched portion and a stem connected to the said arched portion extending through the closed end of the tube, a weight-receiving rack fitted to slide on the tube and secured to said stem, and a counterbalance-lever connected to the said stem, substantially as described.

3. In an automatic pressure-gage, the combination of a tube in direct communication with the pressure-supply and provided in its wall with a series of vertically-arranged openings, a valve having closed walls and open ends fitted in the tube to normally close one or more of the said openings, a hand spring and formed integral with the upper end of said valve, a stem connected to the said arched head and having its upper end

extending through the closed outer end of the tube, and a weight-receiving rack fitted to slide on said tube and secured to the said stem, substantially as described.

4. In an automatic pressure-gage, the combination with the pressure-supply, of a tube having a closed outer end and having its lower end in communication with the pressure-supply, said tube provided in its wall intermediate its ends with a series of vertically-arranged openings, a head detachably secured to the said tube and including the said openings, said head provided in its side with an exhaust-port, a hollow cylindrical valve fitted to slide in said tube and provided at its upper end with an integral arch, a stem connected to the said arch and extending through the closed end of the said tube, and a weight-receiving rack extending the upper end of the tube and having its lower end controlling the tube, and a hand mounted therein, said hand being rigidly secured to the said stem, substantially as described.

5. In combination with a pressure-supply pipe, a tube connected to said supply-pipe and provided with a discharge-outlet, a valve slidably mounted in said tube, means whereby pressure is admitted both above and below the said valve, a stem connected to the said valve, and a counterbalance connected to the said stem.

6. In combination with a pressure-supply pipe, a tube connected to said supply-pipe and provided with a discharge-outlet intermediate its ends, a detachable head including the said outlet and provided with an exhaust-port, a valve provided with closed side walls and open ends slidably mounted in said tube, a transversely-arranged portion secured across the bore of the said valve, a stem connected to the said valve, and means for holding the said valve in its adjusted position.

7. In combination with a pressure-supply, a tube, said tube having its outer end closed and its inner in direct communication with the pressure-supply, and formed intermediate its ends with a discharge-part, a valve slidably mounted in said pipe, means whereby pressure is admitted both above and below the said valve, an annular head including the said discharge-part, and provided with an exhaust-port, a weight-rack slidably mounted on said tube, means for limiting the movement of the said rack, and a stem connecting the said valve with the said rack.

702,217. DRILL. HARRY R. JAMES, Cullington, Utah. Filed Aug. 17, 1901. Serial No. 72,416. (No model.)

Claim.—1. The combination with a drill; of a drill-frame comprising a standard, arms projecting from each end of the standard, one of said arms forming a bearing, an extension on the top of the standard, an arm projecting from the top of the extension and having a bearing concentric with the first-named bearing, a right-angled bearing carried by the last-named arm, a U-shaped arm also carried by the last-named arm and having a bearing concentric with the right-angled bearing.

2. A frame for a drill comprising a standard having an arm at its top, an extension at the top of the standard, and provided with bearings concentric with the bearing in the first-named arm, and an extension or arm at the lower end of the standard, a drill-table carried thereby, said extension being formed in the shape of a dovetail in combination with a base-plate being correspondingly grooved to receive the dovetail extension.

3. A frame for a drill comprising a standard having an arm at its top, an extension at the top of the standard, and provided with bearings concentric with the bearing in the first-named arm, and an extension or arm at the lower end of the standard, a drill-table carried thereby, said extension being formed in the shape of a dovetail in combination with a base-plate being correspondingly grooved to receive the dovetail extension, and a threaded bolt adapted to be secured to a suitable support and provided with a head designed to engage the lower face of the base-plate.

4. The combination with a frame; of a work-holder comprising an arm adapted to embrace the said frame, an integral plate carried by said arm and a spring-pressed guide-plate secured to the first-named plate and means for adjusting said guide-plate.

5. A work-holder comprising an arm, an integral plate or support carried by the frame, a pivoted plate carried by the first-named plate, a spring interposed between the two plates and a set-screw carried by the first-named plate for adjusting the guide-plate.

702,218. VENDING-MACHINE. JOSEPH G. DE JAMBER, Paris, France. Filed Apr. 26, 1900. Serial No. 14,406. (No model.)

Claim.—1. A vending-machine, comprising a slide, a delivery-channel in operative relation to the slide, a rotary compartment drum adapted to hold the articles to be vended, and provided with a spiral rib engaging the slide to move the same, the articles being adapted to drop into said slide successively from the several compartments of the drum, and means for imparting a partial rotation to the drum.

2. A vending-machine, comprising a drum mounted to rotate and compartmented to hold the articles to be vended, the drum being operated peripherally for the discharge of said articles, means for turning the drum, a stationary air-casing located within the drum and in engagement therewith, and an air-firing device connected with said casing to blow the articles out of the drum.

702,219. HEATING APPARATUS. HANAUER H. JOHNSON, Gray Center, Neb. Filed Mar. 4, 1900. Serial No. 94,808. (No model.)

Claim.—1. In a heating apparatus the combination of two water-radiators situated at opposite sides of the apartment to be warmed and having communication with each other forming a water-circuit, of hot-air drums in communication with each other, one being situated within one of the hot-water radiators and the other disposed in the opposite side of the apartment and adapted to receive heat directly into the apartment, and a heater in direct communication with said hot-air drum which is situated within the radiator.

2. A heating apparatus comprising main water-circulating pipes, cross-pipes connecting the ends of the main pipes, a hot-air-conducting pipe arranged within one of the main pipes, and a hot-air drum located

adjacent to and adjustable toward and from the other main pipe, and in communication with said hot-air pipe, substantially as set forth.

3. A heating apparatus comprising main water-circulating pipes, cross-pipes connecting the ends of the main pipes, a hot-air-conducting pipe arranged within one of the main pipes, a hot-air drum located adjacent to the other main pipe, and a telescopic pipe connecting the drum with the hot-air pipe, whereby the drum is made adjustable toward and from the contiguous main pipe, substantially as set forth.

4. A heating apparatus comprising main water-circulating pipes, cross-pipes connecting the ends of the main pipes, a hot-air-conducting pipe arranged within one of the main pipes, one of said cross-pipes being connected at the top and the other at the bottom of the main pipes, a hot-air drum located adjacent to the other main pipe, and a telescopic pipe connecting the drum with the hot-air pipe, whereby the drum is made adjustable toward and from the contiguous main pipe, substantially as set forth.

702,220. MAIL-BOX. SAMUEL A. JONES, Des Moines, Iowa. Filed July 24, 1901. Serial No. 94,815. (No model.)

Claim.—In a mail-box, the combination with arms secured to a support, of a roof connected to said arms, a cylinder having heads provided with apertures journaled in said arms, an arm pivoted on one of said apertures and bearing a cam-sphere, a catch mounted on said roof, and a lug mounted on one of said heads and located to engage said pivoted arm and raise it up into engagement with said catch, substantially as described.

702,221. WASH-TUB. FREDERICK C. KAHN, Chicago, Ill. Filed Dec. 2, 1901. Serial No. 94,822. (No model.)

Claim.—In a tub, the combination of the tub-body, with the fixed portion of the cover secured to the inner portion of the body and overlapping the upper part thereof and provided with an arm to form a part support for the wringer-box, the said wringer-box having its upper edges bent to overlap said arm and the rim, and being located between the said arm and rim of the body, and an angle-iron hoop located on the rim of the body on the top of the overlapping portion of the fixed part of the cover and on the top of that portion of the wringer-box overlapping a portion of the rim of the body, substantially as described.

702,922. CARPET-STRETCHER. FRANK L. KING, BROOKLYN, N. Y., assignor of one-half to Paul Taylor Brown, Brooklyn, N. Y. Filed Dec. 27, 1900. Serial No. 733,083. (No model.)

Claim.—As a new article of manufacture, a carpet-stretcher formed with an elongated head portion having depending therefrom two V-shaped prongs producing a A-shaped recess at the center and a recess at each end; with a row of teeth projecting upwardly from the head; and with a flat integral handle having a slight apex curve and projecting rearwardly from the center of the head above the A-shaped recess and between the V-shaped prongs, approximately at right angles to said head, substantially as described.

702,923. CHECK OR PUMP VALVE. EDWARD KEMMER, BROOKLYN, N. Y. Filed May 22, 1901. Serial No. 61,415. (No model.)

Claim.—In a check or pumping valve the combination of a leather disk, with a supporting-disk provided with an annular rib a perforated guiding-disk and a bolt for clamping same together.

702,924. MUSICAL INSTRUMENT. ERNEST LAMPHERE, BIRMINGHAM, Germany, assignor to Oscar Schmidt, Jersey City, N. J. Filed July 11, 1901. Serial No. 67,570. (No model.)

Claim.—1. In a diaphragm, the combination with the sounding-board, and strings; of two stop-rolls H and I arranged one above the other beyond the ends of the strings and spaced apart and cushioned on adjacent edges as described, a horizontal rod E arranged in front of the stop-rolls and opposite the opening between them, the horizontal hammer-hoys having upturned ends F, and coil-springs G wound around the rod between the ends of each hammer-hoy and having their upper free ends bearing against the bottom of the upper stop-roll substantially as described.

2. In a diaphragm, the combination with the sounding-board and strings; of two stop-rolls H and I arranged one above the other beyond the ends of the strings and spaced apart and cushioned on adjacent edges as described, a horizontal rod E arranged in front of the stop-rolls and opposite the opening between them, the horizontal hammer-hoys having upturned ends F, coil-springs G wound around the rod between the ends of each hammer-hoy and having their upper free ends bearing against the bottom of the upper stop-roll, a bearing D insuring the stop-rolls and hammer-hoys and having an inclined front portion D' for receiving a scale, and an inclined rack K mounted upon the bearing for holding the scale-shells above the scale substantially as described.

702,924.

702,925. DIAPHRAGM-WATER-METER. WILLIAM H. LARRABEE, WORCESTER, Mass., assignor to Union Water Meter Company, Worcester, Mass., a Corporation of Massachusetts. Filed Mar. 2, 1902. Serial No. 64,682. (No model.)

Claim.—1. In a disk-meter, the combination of the rotating disk-piston provided with a projecting stem or shaft, a rotatable disk or plate supported in a circular bearing-rim perpendicular to the vertical axis of the disk-chamber casing, said disk or plate having a side slot embracing the disk-piston shaft, and a pin or projecting member disposed on said disk near the edge thereof, and adapted for traveling in a circle about the central axis, and for contact with the register-actuating member, for the purpose set forth.

2. The rotating top disk carrying an upwardly-projecting, eccentrically-disposed pin, and having a radial slot terminating at a position corresponding to the angular relation of the disk-piston shaft; in combination with the disk-chamber casing having a top bearing within which said rotating disk is peripherally mounted, the rotating disk-piston within said casing, the disk-piston shaft, its end movably engaged in the slot in said rotating disk, and the register-actuating crank or member adapted for actuation by said disk-carried pin.

3. The combination of the disk-chamber casing provided with a top bearing-rim, a rotatable disk-plate mounted in said bearing, said disk-plate having a radial slot, an eccentrically-disposed wrist-pin fixed in said disk, a guard plate or ring enclosing said disk to its bearing, the disk-piston within the chamber, its shaft projecting into the slot in said disk-plate, means for preventing rotary movement of the disk-piston, the register-actuating shaft and an arm attached to said shaft and extending into the path of said wrist-pin.

4. In a disk water-meter, the combination of a rotating or rocking disk-piston having a hole through its plate at an intermediate position between the bearing-hall and the peripheral edge, and a curved pin or guide-rod supported at its respective ends only, within the disk-chamber casing and extending through said hole in the disk-piston plate, for the purpose set forth.

5. In a disk water-meter, in combination, the separable disk-chamber casing having the partition-diaphragm, the disk-piston having its plate

slotted to receive said diaphragm, and provided with a guide-hole, and a stationary guide rod or pin disposed in the disk-chamber intermediate to the center bearing and peripheral wall, one end of said guide-rod rigidly fixed in one section of the casing, and its other end removably retained in connection with the other section of the casing, said guide-rod passing through the hole or opening in the disk-piston plate.

702,926. DIAPHRAGM-WATER-METER. WILLIAM H. LARRABEE, WORCESTER, Mass., assignor to Union Water Meter Company, Worcester, Mass., a Corporation of Massachusetts. Filed Mar. 20, 1902. Serial No. 100,677. (No model.)

Claim.—1. In a disk water-meter, a disk-piston of elliptical shape on its peripheral outer surface in combination with a casing provided with a corresponding elliptical disk-chamber, for the purpose set forth.

2. In a disk meter for water-meters and the like, a disk-piston of elliptical shape, and having the diaphragm-disk therein coincident with the minor axis; in combination with a disk-chamber casing having a chamber of corresponding elliptical shape on plan.

3. The disk-chamber casing having an inlet-port consisting of a substantially triangular opening disposed with its broader open furthest from the diaphragm, and said opening tapering toward the diaphragm; in combination with the diaphragm, the rotating disk-piston having a central bearing-hall, and a waterway leading to said inlet-port.

4. The disk-chamber casing having an inlet-port the opening of which is widest near its forward end and converging toward the diaphragm, and an exit-port the opening of which is widest adjacent to the diaphragm; in combination, with a disk-piston of approximately elliptical peripheral contour, with the diaphragm-coinciding slot at its minor axis.

5. The combination in a disk water-meter, of a casing having a chamber the dimensions of which is greater on a diameter transverse to the diaphragm than on the diameter coincident with the diaphragm, a diaphragm radially disposed in said chamber with inlet and outlet ports at the respective sides thereof, a disk-piston comprising a disk-plate of approximately elliptical peripheral contour, with a radial slot and axial bearing-hall, a rotatable controlling member mounted in a bearing upon the casing, and the piston-shaft obliquely journaled in said member, and means for connecting said rotatable member with the register-actuating device.

6. The combination in a disk water-meter, of a disk-chamber casing internally provided with a disk-chamber of elliptical or approximately elliptical shape on plan, the exterior of said casing being circular and provided with recessed spaces and inlet and outlet ports, a disk-piston of elliptical shape mounted for rotating action within said chamber, and an outer casing having a circular opening in which said disk-chamber casing fits, and provided with waterways that communicate with said recessed spaces, substantially as set forth.

702,927. BURNING-FRAME AND JOINT-COUPLED THERE-TO. JAMES H. LAMSON, BOSTON, Pa. Filed Mar. 6, 1902. Serial No. 64,738. (No model.)

Claim.—1. In a derrick, the combination with angular post-sections, of coupling-beams adapted to embrace the end portions of adjacent post-sections.

2. In a derrick, the combination with a plurality of angular post-sections, of coupling-beams, each recessed to receive the angularly-disposed flanges on aligned ends of post-sections, and T-shaped boys adapted to detachably lock the coupling-beams and post-sections together.

3. In a derrick, the combination with a plurality of angular post-sections and nesting coupling-beams thereof, of transverse opening-beams which have their ends engaged with the coupling-beams, and means to detachably secure the post-sections and beams to the coupling-beams.

4. In a derrick, the combination with a plurality of angular post-sections, of substantially L-shaped coupling-beams, each having two spaced angular walls between which the flanges of aligned ends of the post-sections will fit, and means to detachably secure the angular post ends within the spaces between the angular walls of the coupling-beams.

5. In a derrick, the combination with a plurality of angular post-sections, of substantially L-shaped coupling-beams, each adapted to receive the end portions of angular post-sections, cross-beams engaged at their ends with opposite coupling-beams, and keys insertible in perforations in the beams and in flanges of the post-sections, said keys being adapted by partial rotation to lock the posts, beams and beams together.

6. In a derrick, the combination with a plurality of angular corner-post sections and a plurality of nesting L-shaped coupling-beams adapted to receive the end portions of aligned post-sections, of cross-beams engaged by their ends with the walls of the beams, diagonal braces in the manner engaging their ends with the beams, and T-shaped keys passed through aligned perforations in the beams, beams and braces, said keys by partial rotation securing the braces on the beams and the ends of the cross-beams thereon.

7. In a derrick, the combination with four angular posts, of a set of corner-brackets, each adapted to rest upon a respective post and embrace its flange, a cap-ring engaging the corner-brackets, and means to secure the post ends, corner-brackets and cap-ring together.

8. In a derrick, the combination with a plurality of angular posts, of recessed corner-brackets thereon, a recessed cap-ring seated over the corner-brackets in return-bent hooks thereon, and a cap-plate seated upon the cap-ring.

9. In a derrick, of the character described, a plurality of coupling-beams, each comprising two L-shaped wall-plates spaced apart by a transverse web-block disposed intermediate of their ends.

10. In a derrick of the character described, a plurality of locking-keys, each comprising a straight cylindrical shaft, a cross-handle at one end of the shaft, and a toe projected laterally at the opposite end of said shaft.

11. In a derrick of the character described, a plurality of corner-brackets for the top of the derrick-frame, each comprising two L-shaped wall-plates, spaced apart in parallel planes by an integral web at their upper ends, each wall-plate having a hook-plate bent outward and upward at the lower end thereof.

12. In a derrick of the character described, the cap-ring, having rectangular form and also having an L-shaped recess at each corner.

702,928. CAP-STOPPER. WILLIAM H. KETTER, BOSTON, N. Y. Filed Nov. 27, 1901. Serial No. 63,009. (No model.)

Claim.—The combination with a cap-top, of two wire strands primarily located below the under side of said top while the cap and each having one extremity exteriorly exposed and the opposite extremities secured to the under side of the top, the said strands being crossed in phase at right angles below the center of the under side of the top and normally slack to render them effective in cutting the top, the crossed and exteriorly-exposed ends of the strands being arranged in diametrical relation to the top, the cutting operation of the strands dividing the top into loose flaps inside of the periphery of said top, said flaps being adapted to be bent upwardly to form an outlet for the contents of the can.

702,289. TIME-STAMP. STANLEY C. MILLER, Philadelphia, Pa., assignor to John Wimmer, Philadelphia, Pa. Filed Apr. 24, 1901. Serial No. 57,394. (No model.)

Claim.—1. In a time-stamp the combination of clock mechanism having a main spindle, a type-wheel loosely carried thereby having fixed to it a toothed wheel, an component for governing the motion of the toothed wheel, a second wheel also on the spindle, having teeth constructed to engage said component and operatively connecting said first wheel to the shaft and means for flexibly connecting the type-wheel to the second wheel, substantially as described.

2. In a time-stamp, the combination with a device for printing from type, of clock mechanism, a spindle connected thereto having a type-wheel loosely mounted upon it, a toothed wheel geared to the clock, a spring operatively connecting the said wheel with the type-wheel and an component actuated by the toothed wheel and governing the action of the type-wheel whereby the latter is allowed to periodically move forward, substantially as described.

3. In a time-stamp, the combination with a device for printing from type, of clock mechanism, a spindle connected thereto having on it a toothed wheel turned by said mechanism, a type-carrying wheel having teeth also on the spindle, a projection on one of said wheels, and a spring on the other wheel engaging said projection whereby the operation of the clock mechanism has a tendency to revolve the wheel, an component actuated by the toothed wheel and engaging the teeth of the type-wheel whereby the said type-wheel is allowed to move periodically forward, substantially as described.

4. The combination in a time-stamp, of a device for printing from type with a clock mechanism, a spindle revolved thereby, a toothed wheel loosely mounted on the spindle constructed to be turned by the clock mechanism at a rate different from that of the said spindle, a second toothed wheel fixed to the spindle, type-wheels with a flexible connection between them and the said toothed wheel, an component mechanism actuated by the toothed wheel and engaging with the type-wheels whereby the said type-wheels are allowed to periodically move forward under the action of the clock mechanism transmitted to them through the flexible connection from the toothed wheel, substantially as described.

5. In a time-stamp the combination of a clock mechanism having a main spindle, a type-wheel loosely carried thereby having fixed to it a wheel provided with two sets of teeth in parallel planes, an component for governing the motion of the toothed wheel, a second wheel also on the spindle having teeth constructed to engage and operate said component, gearing connecting said second wheel with the shaft and means for connecting the type-wheel and the second wheel, said means being constructed to permit of motion of said second wheel to a limited extent independently of the type-wheel, substantially as described.

6. In a time-stamp, the combination of a clock mechanism having a main spindle, a type-wheel loosely carried thereby having fixed to it a toothed wheel, an component for governing the motion of the toothed wheel, a second wheel also on the spindle, having teeth constructed to engage and operate said component, gearing connecting the said second wheel with the shaft, a plate projecting from the second wheel, a spring connected to the type-wheel engaging said plate and means for limiting the motion of the type-wheel relatively to the said second wheel, substantially as described.

7. In a time-stamp the combination of a clock mechanism, having a main spindle, a type-wheel loosely carried thereby having fixed to it a toothed wheel, an component for governing the motion of the toothed wheel, a second wheel also on the spindle having teeth constructed to engage and operate said component, gearing connecting said second wheel with the shaft, a bar projecting from one face of the second wheel and passing through an opening in the first toothed wheel, a spring being placed so that the clock mechanism operates the second wheel against the action of the same, substantially as described.

8. In a time-stamp the combination of a clock mechanism having a main spindle, two type-wheels adjacent to one another loosely carried thereby, each having fixed to it a toothed wheel, components for governing the motion of the toothed wheels, a second pair of toothed wheels also on the spindle for operating the respective components and connected to their respective type-wheels so as to allow limited movement thereof independently of the said second pair of toothed wheels, one of said second pair being geared to the main spindle and the other being fixed directly to said spindle, substantially as described.

9. In a time-stamp the combination of a clock mechanism having a main spindle, a wheel fixed thereto having depressions in its periphery forming teeth, each tooth having a face equal in length to the distance between the teeth, a second wheel loosely carried by the spindle provided with two sets of teeth, those of one set coming opposite to the space between the teeth of the other set, a type-carrying wheel fixed to the said second wheel and an component operated by the first toothed wheel and governing the action of the second toothed wheel, and means for operatively connecting the said toothed wheels, substantially as described.

702,280. FEEDER-POST. JAMES A. EYRELL, Chicago, Ill., Filed Apr. 10, 1902. Serial No. 125,395. (No model.)

Claim.—1. The combination in a plastic fence-post of the embedded support or brace consisting of the twin parallel portions and the upper single portion, the wires passing horizontally through the post and connected to the interior support, having their free ends projecting on either side of said post substantially as described.

2. The within-described fence-post comprising the post A, formed of plastic material and an interior brace consisting of the forked bar having the single upper stem and twin vertical supports and the tie-wire connecting said supports and extending out on either side of the post, substantially as described.

702,281. TRACK-GATHERING DEVICE FOR RAILROADS. ABRAHAM C. HANCOCK, New Providence, R. I. Filed Mar. 6, 1902. Serial No. 58,395. (No model.)

Claim.—1. The improved sand-box or track-gathering device hereinbefore described, the same comprising a portable box or casing, adapted to be removably secured to the underbottom of a street-car, a removable sand-holding reservoir mounted within the casing, a spring-pressed reversible

table charging member d having a measuring-rod therein registering with an opening formed in the bottom of said reservoir, an operating-lever e extending through the wall of the box, a connection arranged wholly within the box uniting said charging and lever members, d and e, and a chute through which the charges of sand are discharged from the apparatus.

2. The portable track-gathering apparatus A herein described, adapted to be attached to a street-car, the same consisting of a casing or box provided with a carrying handle or handle, a vertically-movable reservoir A for the sand mounted within the casing and having a discharge-outlet, suitable guides and stops for controlling the movements of the reservoir, a reversible charging-roll provided with pockets adapted to register with the said discharge-outlet of the reservoir, and a handle-lever connected with and adapted to rotate said roll upon depressing the lever, substantially as shown and described.

3. In a track-cleaning device, a vertically-movable apertured reservoir A for containing the sand, fixed stops for limiting the downward movement of the reservoir, guide-rolls r or other analogous means attached to the reservoir, fixed guides or ways g having said rolls r fitted to slide therein, whereby the reservoir is prevented from moving except in a vertical direction, and means, substantially as shown and described, for discharging predetermined quantities or charges of sand from the reservoir.

702,282. DISPLAY-RACK. GEORGE B. HOGAN, St. Louis, Mo., Filed Oct. 22, 1899. Renewed Dec. 4, 1901. Serial No. 54,392. (No model.)

Claim.—In a display-rack having a plurality of spring-actuated fingers, loops 10 formed on the ends of said fingers, and points 11 projecting from said loops, as and for the purpose specified.

702,283. CONNECTION FURNITURE. JAMES MORAN, New York, N. Y. Filed Mar. 22, 1901. Serial No. 55,393. (No model.)

Claim.—1. A combination article of furniture comprising a main oblong frame composed of three separate parts hinged together, one of the end parts being provided with legs and the adjacent middle part being provided adjacent to the opposite end part with hinged legs, said legs

being provided with locking devices and said legs and said first-named end part being also provided with locking devices whereby the legs of the middle part may be held at right angles thereto, and the middle part be held in an upright position, substantially as shown and described.

2. An article of furniture of the class described, comprising a main oblong frame composed of three separate hinged parts, one of the end parts being provided with legs and keepers, the middle part being provided adjacent to the opposite end part with hinged legs, said hinged legs being provided with hooks, and said last-named end part with a pivoted attachment operating in connection with said hooks, rods also pivotedly connected with said hinged legs, and locking-bolts connected with said rods e-d operating in connection with the keepers secured to the first-named end portion to hold the middle part in an upright position, substantially as shown and described.

3. A combination article of furniture comprising an oblong frame composed of three separate hinged parts provided with a bed-spring connected with the sides and ends thereof by spiral springs, said bed-spring being foldable at the points where the parts of the main frame are hinged, and device in connection with one of the end parts of the main frame and with the middle part, for holding the middle part in an upright position with reference to said end part, the other end part being adapted to fold downwardly and backwardly adjacent to the middle part, substantially as shown and described.

702,284. CHAIR. ALFRED J. MURLEY, Victoria, Canada. Filed June 27, 1901. Serial No. 56,394. (No model.)

Claim.—1. A chair having a lever engaging the seat at the front end thereof, and a spring-pressed cam-arm engaging both the lever and the seat, as set forth.

2. A chair-seat having a lever engaging the seat at the front end thereof, a spring-pressed cam-arm engaging both the lever and the seat, and a dash-pot connected with the seat to control the speed of the seat in its upward and downward motion, as set forth.

3. A chair having a seat-frame, a post, levers fulcrumed on the seat-frame and pivotedly connected with the seat at the front end thereof, and spring-pressed cam-arms fulcrumed on the seat-frame and engaging the said seat and the levers, as set forth.

4. A chair having a seat-frame, a seat adapted to rest on the said seat-frame when in a lowermost position, levers fulcrumed on the rear of the seat-frame and pivotedly connected with the seat at the front end thereof, and spring-pressed cam-arms fulcrumed on the seat-frame and engaging the said seat and the said levers, as set forth.

5. A chair having a seat-frame, a seat adapted to rest on the said seat-frame when in a lowermost position, levers fulcrumed on the rear of the seat-frame and pivotedly connected with the seat at the front end thereof, spring-pressed cam-arms fulcrumed on the seat-frame and engaging the said seat and the said levers, and a locking device for locking the said seat to the said seat-frame, as set forth.

6. A chair having a seat-frame, a seat, levers fulcrumed at their rear ends on the rear of the seat-frame, the levers being pivotedly connected

at their forward ends with the seat, at the front end thereof, cam-arms engaging the under side of the said seat, friction-rollers carried by the said cam-arms and engaging the under side of the said lever, and a spring-pressed shaft journaled in the seat-frame and carrying the said cam-arms, as set forth.

7. A chair having a seat-frame, a seat, levers fulcrumed at their rear ends on the rear of the seat-frame, the levers being pivotally connected at their forward ends with the seat, at the front end thereof, cam-arms engaging the under side of the said seat, friction-rollers carried by the said cam-arms and engaging the under side of the said lever, a spring-pressed shaft journaled in the seat-frame and carrying the said cam-arms, and means, substantially as described, for adjusting the tension of the spring on the said shaft, as set forth.

8. A chair having a movable seat, spring-actuated means for moving the seat upward from a lowered position when the seat is released from its load, and restraining means connected with the said seat for gradually restraining the upward movement of the seat as set forth.

9. A chair having a movable seat, spring-actuated means for moving the seat upward from a lowered position when the seat is released from its load, and restraining means connected with the said seat for gradually restraining the upward movement of the seat, the power of the said restraining means diminishing gradually and at the time that the power of the spring-actuated means decreases, as set forth.

702,285. FIRE-DRYING APPARATUS. ALBERT MORRIS, Rochester, N. Y. Filed Feb. 27, 1902. Serial No. 95,994. (No model.)

Claim.—1. In an apparatus of the character described, the combination with a furnace or heater having a smoke-stack for the discharge of the products of combustion; of a boiler arranged therein, a drying-cylinder arranged within the boiler, a vapor-chamber in communication with the drying-cylinder and provided in its upper portion with an outlet whereby the particles of material carried along with the vapors and gases will be precipitated in said chamber, means for agitating the material within the drying-cylinder, and means for forcing air and a part of the products of combustion passing into the stack through the drying-cylinder, substantially as described.

2. In an apparatus of the character described, the combination with a furnace; of a boiler arranged therein, a drying-cylinder extending longitudinally within the boiler and provided at its ends with inlets for the supply of the material therein, and outlets for the withdrawal of the material, means within the cylinder for agitating the material, a vapor-chamber in communication with one end of the drying-cylinder and provided with an outlet to the atmosphere, and means for supplying air and a portion of the products of combustion from the smoke-stack of the furnace to the opposite end of the cylinder, whereby the heated air and products will be caused to pass through said cylinder and from the cylinder to the vapor-chamber and thence discharge to the atmosphere, whereby the drying off of the gases and vapors is facilitated, substantially as specified.

3. In an apparatus of the character described, the combination with a furnace provided with a smoke-stack, and a passage communicating between the fire-box and smoke-stack for the outlet of the gases and products of combustion; of a boiler arranged within the furnace casing, drying-cylinders arranged within the boiler, means for supplying the material to be dried to said cylinders, means within the cylinders for agitating the material under treatment, a vapor-chamber, means for conducting the gases and vapors from the drying-tubes to said chamber, an outlet communicating with the upper portion of the vapor-chamber, whereby the particles of material carried along with the vapors are caused to

be precipitated in said chamber, and means for utilizing the heat from the products of combustion entering the stack and applying the same to the drying-cylinders for promoting the drying action, substantially as and for the purpose described.

702,286. GAS-REGULATOR. SYLVESTER L. MAGRAN, Denver, Colo. Filed Apr. 12, 1901. Serial No. 54,704. (No model.)

Claim.—In a gas-regulator, the combination of a single-casing, having a horizontal dividing-wall forming an upper and a lower compartment in said casing, a vertical partition in the lower compartment formed integral with the dividing-wall forming an inlet and an outlet chamber, the said horizontal dividing-wall having openings 11, 12, establishing communication between the upper compartment and the inlet-chamber, and having an opening 14 establishing communication between the upper compartment and the outlet-chamber, an upwardly-extending standard carried by the horizontal dividing-wall, a beam pivotally secured to said standard, a valve carrying a depending stem connected to one end of said beam, said valve being seated on the upper face of said horizontal dividing-wall and having its stem operating therethrough, a stem carrying a check pivotally connected to said beam intermediate of its length, said stem operating through the said horizontal dividing-wall and carrying a valve on its lower end which valve seats against the under face of the horizontal dividing-wall, a lever having its one end pivotally secured to the casing and carrying a dial on its free end, the other end of said lever being pivotally secured to said lever, said beam and lever being substantially parallel with one another and with said horizontal dividing-wall, a flat diaphragm forming the upper end of said upper compartment mounted in said casing and engaged by said dial, said diaphragm being in horizontal alignment with said lever and beam, a dome secured to the casing, and a spring having its one end bearing against said diaphragm above said dial and means carried by the dome for guiding and adjusting said spring whereby the desired pressure for consumption may be had by adjustment of said spring, substantially as described.

702,287. FOLDING CRATE. CHARLES E. McCULLOUGH, Leep, Pa. Filed Mar. 29, 1902. Serial No. 100,084. (No model.)

Claim.—1. In a folding crate, the combination of a base, hinged sides and ends, a lid or cover formed in two sections hinged to said sides, yokes secured to said base, handles attached to said yokes, rods carrying engaging ends dovetailed to said yokes and extending through said lid or cover, substantially as described.

2. In a folding crate, the combination of a base, hinged sides and ends, a lid or cover formed in two sections hinged to said sides, yokes secured to said base, rods carrying hooked ends engaging said yokes, the upper end of said lid or cover, and a rod extending through said lid or cover, and means whereby said rods are locked in position, substantially as described.

3. In a folding crate, the combination of a base having beveled ends, hinged sides and ends, a lid or cover formed in two sections hinged to said sides, yokes secured to said beveled ends, handles pivotally attached

to said yokes, and means to secure said ends in a closed position, substantially as described, and for the purpose set forth.

702,288. SCISSORS OR SHEARS. DAVID McKINNA, Waterbury, Conn., assignor of one-half to James McKinnon, Waterbury, Conn. Filed Nov. 7, 1901. Serial No. 51,499. (No model.)

Claim.—1. The combination with the blades of scissors and shears, of a pivot upon which one of the blades turns and which is provided with a threaded end to engage the other blade and an open groove or recess in its end, and a removable spring retaining device which engages the groove to prevent the pivot from turning, and which may be lifted from said groove to enable the pivot to be adjusted.

2. The combination with the blades of scissors and shears, of a pivot upon which one of the blades turns and which is provided with a threaded end to engage the other blade and an open groove or recess in its end, and a removable spring retaining device recessed into the blade and engaging the groove to prevent the pivot from turning, and which may be lifted from said groove to enable the pivot to be adjusted.

3. The combination with the blades A and B of scissors and shears, said blade B having a slot 18, of a pivot upon which blade A turns and which is threaded to engage blade B, the threaded end of the pivot having an open groove or recess 19 in its end, and a spring retaining device rigidly secured in slot 18, the free end of said retaining device engaging the groove 19 to prevent the pivot from turning.

702,289. CAR-COUPLING. JOHN C. NELSON, Dayton, Tenn. Filed Jan. 4, 1902. Serial No. 93,445. (No model.)

Claim.—1. The combination with draw-bars, or draw-heads secured thereto, and having formed integral therewith fingers having laterally-inclined faces, jaws pivotally mounted upon the draw-heads and having recesses forming a slot when brought together, said jaws being adapted to engage the inclined faces whereby they are swung in a horizontal plane to bring the recesses together, and a coupling-pin adapted to be inserted into said slot to lock the jaws.

2. The combination with draw-heads having seats therein, of jaws secured thereto, and having grooves or recesses forming a slot when brought together, a coupling-pin inserted into said slot locking the jaws, and means for raising and swinging said pin in the arc of a circle whereby it is withdrawn from the slot and placed in one of the seats.

3. The combination with draw-heads, of jaws secured thereto and having grooves or recesses forming a slot when brought together, a shifting-lever having a horizontal arm and a vertical arm, the latter being journaled on one of the draw-heads, a coupling-pin mounted upon the horizontal arm to have a longitudinal movement thereon, and means for opening and closing said shifting-lever.

4. The combination with draw-heads, of jaws pivotally secured thereto and having grooves or recesses forming a slot when brought together, and also having lugs or projections, fingers secured to the draw-heads and having laterally-inclined faces, against which is adapted to be directed the lugs or projections swinging the jaws in a horizontal plane to bring and hold the jaws together, a pin inserted into said slot locking the jaws, and means for withdrawing said pin.

5. The combination with draw-heads, of jaws secured thereto and having grooves or recesses forming a slot when brought together, and a coupling-pin to be inserted into said slot locking the jaws, and consisting of a casing having a shoulder, a core within said casing and a rod passing through the casing-pin is so attached to a shifting mechanism.

6. The combination with draw-bars, or draw-heads secured thereto, jaws pivotally secured to the draw-heads, and having recesses forming a slot when brought together, a shifting-lever having a horizontal arm, and a vertical arm, the latter being journaled on one of the draw-heads, a coupling-pin mounted upon the horizontal arm, a coupling and uncoupling rod provided with a disk having an opening for the reception of the

vertical arm, and fingers upon the disk to engage the horizontal arm whereby it may be swung in the arc of a circle.

7. The combination with draw-bars, or draw-heads secured thereto and having formed integral therewith fingers having laterally-inclined faces, jaws pivotally secured to the draw-heads and having recesses forming a slot when brought together, a shifting-lever having a horizontal arm and a vertical arm, the latter being journaled on one of the draw-heads, a coupling-pin mounted upon the horizontal arm to have a longitudinal movement thereon, a coupling and uncoupling rod provided with a disk having an opening for the reception of the vertical arm, and fingers upon the disk to engage the horizontal arm whereby it may be swung in the arc of a circle.

702,240. AUTOMATIC GUN. ANDREW SCOTT, Newmarket-on-Tyne, England, assignor to W. & A. Armstrong, Whitworth & Company, Limited, Newmarket-on-Tyne, England. Filed Jan. 21, 1902. Serial No. 92,662. (No model.)

Claim.—1. In an automatic gun the combination of a cartridge-belt, a spool at the lower part thereof, a lowering-arm and a retaining-arm both fast on the spool and means for giving a partial rotation to the spool first in one direction and then in the other.

2. The combination of a gun-mounting a gun sliding therein, a cartridge-belt carried by the mounting, a spool at the lower part of the belt, a lowering-arm and a retaining-arm both on the spool, means for giving a partial rotation to the spool first in one direction and then in the other, and means carried by the mounting for injecting a cartridge into the gun.

3. The combination of a gun-mounting, a gun sliding therein, means for running out the gun after recoil, a transversely-sliding breech-block in the gun, a cartridge-belt carried by the mounting, a spool at the lower part of the belt, a lowering-arm and a retaining-arm both on the spool, means for giving a partial rotation to the spool in one direction to allow a cartridge in the belt to drop onto the lowering-arm means for opening the breech and ejecting the empty cartridge-cases while the gun runs out, means for subsequently turning the spool back again to bring the cartridge on the lowering-arm in line with the bore of the gun and means for injecting this cartridge into the gun.

4. The combination of a gun-mounting, a gun sliding therein, a cartridge-belt carried by the mounting, a spool at the lower part of the belt, a lowering-arm and a retaining-arm both on the spool, a groove on the gun and an arm on the spool engaging the groove.

5. The combination of a gun-mounting, a gun sliding therein, means for running out the gun after recoil, a transversely-sliding breech-block in the gun, a cartridge-belt carried by the mounting, a spool at the lower part of the belt, a lowering-arm and a retaining-arm both on the spool, means for giving a partial rotation to the spool first in one direction then in the other, a transversely-sliding block on the gun, a spring carried by the mounting, a rod compressing the spring during recoil, a link connecting the rod with the arm on the shaft, a catch retaining the rod in its rearmost position, a crank on the shaft operating the breech-block and an arm on the gun releasing the catch to free the arm and allow the spring to close the breech.

6. The combination of a gun-mounting, a gun sliding therein, means for running out the gun after recoil, a transversely-sliding breech-block in the gun, a bolt on the block engaging a recess in the breech for holding the block down, a lever engaging the bolt and adapted to be operated by an injected cartridge, a cartridge-belt carried by the mounting, a spool at the lower part of the belt, a lowering-arm and a retaining-arm both on the spool, means for giving a partial rotation to the spool first in one direction and then in the other, a transversely-sliding block on the gun, a spring carried by the mounting, a rod compressing the spring during recoil, a link connecting the rod with the arm on the shaft, a catch retaining the rod in its rearmost position, a crank on the

JUNE 10, 1903.

shaft operating the breech-block and an arm on the gun releasing the catch to free the arm and allow the spring to close the breech.

7. The combination of a gun-mounting, a gun sliding therein, means for running out the gun after recoil, a transversely-sliding breech-block in the gun, a cartridge-hopper carried by the mounting, a spindle at the lower part of the hopper, a lowering-arm and a retaining-arm both on the spindle, means for giving a partial rotation to the spindle first in one direction and then in the other, a transverse shaft on the gun, an arm on the shaft, a spring carried by the mounting, a link connecting the arm on the shaft, a removable pin connecting the rod and link, a catch retaining the rod in its rearward position, a crank on the shaft operating the breech-block and an arm on the gun releasing the catch to free the arm and allow the spring to close the breech.

8. The combination of a gun-mounting, a gun sliding therein, a cartridge-hopper carried by the mounting, a spindle at the lower part of the hopper, a lowering-arm and a retaining-arm both on the spindle, a groove on the gun, an arm on the spindle engaging the groove, means for running out the gun after recoil, a transversely-sliding breech-block in the gun, a transverse shaft on the gun, an arm on the shaft, a spring carried by the mounting, a rod connecting the arm on the shaft, a catch retaining the rod in its rearward position, a crank on the shaft operating the breech-block and an arm on the gun releasing the catch to free the arm and allow the spring to close the breech.

9. The combination of a gun-mounting, a gun sliding therein, a cartridge-hopper carried by the mounting, a spindle at the lower part of the hopper, a lowering-arm and a retaining-arm both on the spindle, a groove in the gun, an arm on the spindle engaging the groove, means for running out the gun after recoil, a transversely-sliding breech-block in the gun, a bolt on the block engaging a means in the breech for holding the block down, a lever engaging the bolt and adapted to be operated by an injected cartridge, a transverse shaft on the gun, an arm on the shaft, a spring carried by the mounting, a rod connecting the arm on the shaft, a catch retaining the rod in its rearward position, a crank on the shaft operating the breech-block and an arm on the gun releasing the catch to free the arm and allow the spring to close the breech.

702,941. DISK WATER-METER. FRANK L. NORTON, Des. No., assigned to Union Water Meter Company, Worcester, Mass., a Corporation of Massachusetts. Filed Feb. 2, 1902. Serial No. 99,599. (No model.)

Claim.—1. In a disk-meter, a disk-plate having its peripheral edge formed with an eccentric outwardly-curved protuberance beyond the regular circle curvature; in combination with a disk-chamber casing having a lateral enlargement of its chamber, the inner surface of which enlargement is approximately of spherical curvature and in conformity to the surface developed by the protuberant extension of the rotating disk-plate in its motion.

2. A disk-meter comprising a disk-plate having at one side an inclination to accommodate the displacement, and at an approximately opposite position provided with a rounded peripheral bulge in the outline of its edge; in combination with a disk-chamber casing having an inlet and outlet port, a partition-diaphragm, and a lateral conical enlargement or recess of substantially similar rounded contour, counterbalancing said disk, and within which said peripheral enlargement engages and has rotating motion with the movement of the disk-plate.

3. In a disk water-meter, a disk-plate having a regularly-curved protuberance on its peripheral outline, in combination with a disk-chamber casing having on its interior face a deviating curve of the wall surface corresponding in vertical outline to the vertical contour of the chamber-wall surface, and in horizontal outline to the contour of the curve of the disk periphery.

702,942. IRONING-BOARD. EMERSON GRAY, Pittsburg, Pa. Filed Feb. 12, 1902. Serial No. 99,598. (No model.)

Claim.—1. An attachment for ironing-boards comprising a series of pivoted links supported by the ironing-board, with a pair of sub-parallel rods carried by the links, and having an open connection to said rods, substantially as described.

2. An attachment for ironing-boards comprising a brace secured to the under face of the ironing-board and projecting from the side thereof, a series of pivoted links carried by the brace, a rod secured to the outer end of said links and a second rod carried by said links adjacent to the ironing-board, and an open connection by its ends to said rods, substantially as described.

702,943. REVERSIBLE DRIVING MECHANISM. CHARLES A. PARONELLA, Wheeling, N. Y. Filed Feb. 27, 1902. Serial No. 99,597. (No model.)

Claim.—1. In a reversible driving mechanism, a driven shaft, tubular shafts mounted to turn upon the driven shaft, a driving-pulley loosely mounted upon the tubular shafts, tubular shafts mounted upon the driving-pulley, a gear and a pinion fixed on each link, a gear on one of the tubular shafts in mesh with the pinions of the driving-pulley, a pinion upon the opposite tubular shaft meshing with the gear on said pulley, and clutches arranged to bring either tubular shaft in locking engagement with the driven shaft and for checking the rotation of either tubular shaft, as described.

2. In a reversible driving mechanism, the combination with the driven shaft, tubular shafts loosely mounted on the driven shaft, bearings for the tubular shafts, disks secured to said bearings, and clutch-disks attached to the driven shaft, of a pulley loosely mounted on the tubular shafts, pinions carried by the said pulley, tubular shafts mounted on the said pin, a pinion and a gear secured to each tub, a pinion attached to the inner end of one of the tubular shafts, meshing with the gear carried by the pulley, a gear secured upon the inner end of the opposite tubular shaft meshing with the pinions carried by the pulley, and clutches mounted to turn with the tubular shafts yet slide thereon, which clutches are adapted for engagement with the said disks or clutches on the driven shaft, as described.

702,944. PREVENTIVE FOR TREATMENT OF COPPER-WATER. ANDREW J. FALGOUT, Whitehall, Me., assigned to two-thirds to Joseph Hinch and Albert C. Dygart, Bates, Me. Filed Mar. 21, 1902. Serial No. 99,596. (No specimen.)

Claim.—1. The herein-described precipitant for copper-water, containing in solution a salt of sodium, and an excess of sodium hydroxide, substantially as described.

JUNE 10, 1903.

U. S. PATENT OFFICE.

2481

2. The herein-described precipitant for copper-water, containing in solution a salt of sodium, and an excess of sodium hydroxide, substantially as described.

702,945. PUMP. ANDREAS RADOVANOVICH, Zurich, Switzerland. Filed Jan. 12, 1902. Serial No. 99,595. (No model.)

Claim.—1. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a short cylinder interposed between them, of a plunger having an enlargement thereon to move in the pump-chamber and cylinder, whereby hydrostatic pressure is produced in the suction-chamber to suck said valve, substantially as described.

2. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a short cylinder interposed between them, of a plunger having an enlargement thereon adapted to move into the short cylinder and vent fluid from the latter to the former chamber and communicate hydrostatic pressure to said valve, substantially as described.

3. In a pump, the combination with a pump-chamber having a reduced end, a suction-valve chamber and valve therein, and a short cylinder interposed between the reduced end of the pump-chamber and valve-chamber; of a plunger and an enlargement on the end thereof to move in the pump-chamber and cylinder, to cooperate with the reduced end of the pump-chamber and cylinder to produce hydrostatic pressure on the suction-valve, substantially as and for the purpose set forth.

4. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a short cylinder between the two chambers, of a plunger, an enlargement thereon cooperating with the short cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, and means to prevent the formation of a partial vacuum in the pump by reason of the displacement of the plunger, substantially as described.

5. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a cylinder between the two chambers, of a plunger, an enlargement thereon cooperating with the cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, and auxiliary means to vent fluid between the two chambers, substantially as described.

6. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a cylinder between the two chambers, of a plunger, an enlargement thereon cooperating with the cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, auxiliary means to vent fluid between the two chambers and means to prevent the formation of a partial vacuum in the pump, substantially as described.

7. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a cylinder between the two chambers, of a plunger, an enlargement thereon cooperating with the cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, and auxiliary means to vent fluid between the two chambers, substantially as described.

8. In a pump, the combination with the pump-chamber, suction-valve and chamber and a short cylinder between the two chambers; of a plunger, a yielding enlargement on the plunger cooperating with the cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, and auxiliary valve-controlled means to vent fluid between the two chambers, substantially as and for the purpose set forth.

9. In a pump, the combination with the pump-chamber, suction-valve and chamber and a short cylinder between the two chambers; of a plunger having a reduced end and a spring-held enlargement on the end thereof cooperating with the cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, substantially as and for the purpose set forth.

10. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a short cylinder interposed between them, of a plunger and an enlargement thereon adapted to yield to a predetermined fluid-pressure, whereby hydrostatic pressure is produced in the suction-valve chamber to suck said valve, substantially as described.

11. In a pump, the combination with the pump-chamber, suction-valve and chamber, and a short cylinder between the two chambers; of

a plunger having a reduced end, a spring-held enlargement on the end of the reduced portion cooperating with the cylinder to vent fluid between the two chambers and produce hydrostatic pressure on the suction-valve, auxiliary valve-controlled means to vent fluid between the two chambers, and an auxiliary piston adapted to move into the pump-chamber to prevent the formation of a vacuum therein, substantially as and for the purpose set forth.

702,946. INTERNAL-COMBUSTION ENGINE. J. S. BROWN, New York, N. Y. Filed May 4, 1901. Serial No. 99,594. (No model.)

Claim.—1. A combination or explosive engine combined with a refrigerator and a regenerator or heater, said refrigerator and regenerator arranged parallel with one another and both opening into the combustion-chamber of the engine and mechanism substantially as described for opening the refrigerator and closing the regenerator while the engine is charging and compressing, and for closing the refrigerator and opening the regenerator while igniting and exhausting substantially as described.

2. An internal-combustion engine having a cylinder, a receptacle made to communicate with said cylinder, a refrigerator and regenerator in said receptacle, and a displacer made to alternately contact with the refrigerator and regenerator, said engine having an entrance or charge opening and an exhaust substantially as described.

3. An engine having a cylinder and a receptacle provided with cooling and heating faces, a displacer having cooling and heating faces, and mechanism for shifting the displacer from and to contact with the receptacle-faces, said faces being corrugated or having ridged contact portions substantially as described.

4. An engine having a cylinder, a receptacle provided with a cooler and a heater, a shiftable displacer made to contact with the cooler and heater, and a water-jacket of said cooler substantially as described.

5. A cylinder provided with a supply-port, a regenerator and refrigerator opening at one end into the forward end of said cylinder, and a displacer forming the top wall of the refrigerator and the bottom wall of the regenerator.

6. A cylinder and piston combined with a shaft driven by the piston, a secondary shaft actuated at varying speed from the first-named shaft, a receptacle made to communicate with the cylinder, a port and combustible-supply for the cylinder actuated by the secondary shaft, and a refrigerating and regenerating displacer and exhaust for the receptacle actuated by said secondary shaft substantially as described.

7. An internal-combustion engine of the four-cycle type combined with a regenerator comprising interlocking and separating parts, and mechanism substantially as described for actuating the regenerator so as to cause the latter to control the instant of explosion or ignition of the combustible-mixture substantially as described.

8. An internal-combustion engine combined with a regenerator for storing heat, a refrigerator, said refrigerator and regenerator comprising interlocking or separating parts and mechanism substantially as described for actuating the refrigerator and the regenerator so as to cause the heated

parts of the regenerator to ignite the suitably-compressed explosive mixture substantially as described.

9. An internal-combustion engine comprising a cylinder combined with a regenerator made to open permanently into the cylinder and having a liquid-fuel inlet and adapted for starting heat, and mechanism substantially as described for transversely actuating the regenerator so as to cause the heated parts of the same to vaporize and ignite the fuel substantially as described.

10. An internal-combustion engine of the four-cycle type provided with a regenerator and a refrigerant opening directly into one end of the cylinder of the engine, and a liquid-fuel inlet, combined with an exhaust-valve, a cam for opening said valve during the operation of the first part of the compression-stroke of the engine thereby allowing a portion of the air sucked in during the suction-stroke to escape through said exhaust-valve and then allowing said valve to close so that the remainder of said air will be compressed by said compression-stroke, substantially as described.

11. Is an internal-combustion engine, a combined refrigerating regenerator and refrigerant opening into the cylinder of the engine.

12. An internal-combustion engine combined with a regenerator and a refrigerant communicating directly at one end with one end of the cylinder of an engine, and a shiftable displacer for alternately opening and closing said refrigerant and regenerator.

702,247. ADJUSTABLE SWITCH OR OUTLET BOX. JAMES H. EMMET, Butley, N. J. Filed Dec. 20, 1901. Serial No. 57,000. (No model.)

Claim.—1. A switch box and support, comprising a plurality of adjustable sections one of which is provided with slots, adjusting or leveling screws between said sections extending through said slots, and means for locking said screws against rotation, the said slots providing for the lateral or torsional adjustment of said sections.

2. A switch box and support, comprising a plurality of telescopic sections, and leveling-screws between the same, one of said sections being provided with slots through which said screws pass, to allow a lateral or torsional adjustment.

3. A switch box and support, comprising a plurality of sections, one of which is fixed, and the other of which is adjustable within the same, a switch-supporting frame secured to, and adjustable or movable with, the adjustable section, and leveling-screws fitting within corresponding taps in the fixed section, and provided with shoulders against which the adjustable section bears.

4. A switch box and support, comprising a fixed section, an adjustable section having outwardly-extending lugs thereon, leveling-screws fitting corresponding taps in the fixed section, extending into said lugs, provided with shoulders bearing thereon, and a switch-supporting frame carried by the adjustable section.

5. A support comprising sections combined with tapped adjusting-screws and binding or firing screws adapted to engage the taps substantially as described.

6. A support comprising a section, shoulder screws carried by the section, a second section supported on the screw-shoulders, and binding-screws adapted to fit with the shoulders for clamping or securing the second section, substantially as described.

702,248. BUSH-KRAMEL. MARGARET J. KRAMEL, Stamford, N. Y. Filed Mar. 14, 1902. Serial No. 62,284. (No model.)

Claim.—1. In combination with a pan and cover therefor, a shaft mounted in said pan in a socket in the bottom of the pan, a stirrer journaled to rotate on said shaft, a plate mounted above the cover, straps connecting said plate with said stirrer and adapted to rotate therewith, a gear-wheel rotating about said shaft and connected in said straps, and means for rotating said gear-wheel, as set forth.

2. In combination with a pan and cover, which latter is supported,

a shaft supported in said pan in a socket therein, a stirrer-disk journaled on said shaft and points fastened to said disk, a rotatable plate mounted above the cover, straps connecting said plate with said stirrer, a gear-wheel journaled on the shaft and fastened to said straps, a tubing with disks fastened to its ends, mounted upon said shaft, a gear-wheel journaled above said tubing, and a vertically-mounted gear-wheel in mesh with said gear-wheel which is connected to the stirrer, and the straps connected at their ends to the edge of the cover, and radiating from a disk which is mounted on said shaft, as set forth.

702,249. PIPE. THOMAS M. SARRMAN, Norristown, Pa. Filed Jan. 28, 1902. Serial No. 51,554. (No model.)

Claim.—A tobacco-pipe having a chamber closed at the outer end and containing a mass of absorbent material less in diameter and length than said chamber so that it is exposed both at the end and sides, a passage leading from said chamber to the stem of the pipe and a passage leading from the chamber to the bowl of the pipe, said latter passage comprising two parts separated by a chamber of larger diameter than each of said parts, and a removable cap closing the said chamber, substantially as described.

702,250. DRAG FOR GATHERING MUSHROOMS. JOHN W. SEARS, Sidney, Ark. Filed Mar. 1, 1902. Serial No. 52,208. (No model.)

Claim.—1. A drag or device for gathering mushrooms comprising a frame having teeth at its forward edge, runners on which the frame rests, a bag for receiving the mushrooms, handles connected to the drag, and a shaft for supporting said handles, and means for raising and lowering the drag or device, as set forth.

2. A drag for gathering mushrooms comprising a frame having teeth at its forward edge, runners for said frame, handles projecting from the ends of the frame, boots or shoes and a platform connecting the same, the ends of said handles supported by said boots, a winch mounted on said platform and having ropes winding about the same connected to the frame of the drag whereby the latter may be raised or lowered, as set forth.

3. In combination with a drag for gathering mushrooms having teeth at its forward end, runners for the frame, a bag for receiving the mushrooms, handles projecting from the rear end of the frame, boots having socket members on the adjacent edge thereof adapted to receive the ends of said handles, a platform connecting the boots, a winch mounted on said platform and having ropes wound about said winch and connected to the opposite side of the frame, a second winch designed to be mounted on the shore of a stream having cable wound about the same connected to the said frame, and power means for drawing the drag forward, as set forth.

702,250.

702,251. WATER-WHEEL. SAMUEL BOWLER, Strongstown, Pa. Filed Dec. 2, 1901. Serial No. 73,000. (No model.)

Claim.—The combination with a casing, of a reservoir supported therein, a vertical shaft revolvably mounted in the casing, and extending upwardly through the center of the reservoir, a wheel carried by said shaft and arranged below the reservoir and having buckets on its periphery, discharge-spouts extending diagonally downward from the bottom of the water-reservoir, a gate commanding each spout, vertically-extending rods carrying said gates and provided with transverse pins at their upper ends, and a hand or wheel mounted to turn on the shaft within the reservoir and provided with a series of similar diagonal slots engaging said pins, whereby the gates may be simultaneously raised or lowered.

702,252. HAND-PRINTING MACHINE. CHARLES GRAMMERS, Boston, Mass. Filed Dec. 10, 1901. Serial No. 55,370. (No model.)

Claim.—1. In a photographic-printing machine, a diaphragm flexible traveling apron, and a coincidently-traveling bed, the two having a contacting zone and being separated on both sides of said zone to receive and discharge the work.

2. In a photographic-printing machine, a rotary drum and a coincidently-traveling diaphragm flexible apron partially enclosing said drum and expanding therefrom on both sides of the zone of contact for the purpose of receiving and discharging the work.

3. In a photographic-printing machine, a diaphragm flexible traveling apron, a coincidently-traveling bed, the two having a contacting zone and being separated on both sides of said zone to receive and discharge

the work, and rolls attached to both ends of said apron and on which the latter may be alternately wound and unwound.

4. In a photographic-printing machine, a diaphragm flexible traveling apron, a coincidently-traveling bed, the two having a contacting zone and being separated on both sides of said zone to receive and discharge the work, a set of mechanism associated with one end of the work and having provisions for flexibly returning the rollers of the apron, an automatic take-up mechanism connected with the other end of the apron, and expandable feed-rolls located between the contacting zone and said take-up mechanism for propelling said apron.

702,253. PIPE-WRENCH. JOHN F. GRAMMERS, Michigan City, Ind., assignor of one-half to Peter Hinkley, Michigan City, Ind. Filed Nov. 18, 1901. Serial No. 62,744. (No model.)

Claim.—1. The combination with a handle or lever carrying a fixed jaw; of a pivoted jaw provided at its upper end with a series of sliding perforations having communicating rectangular openings, a supporting-shaft journaled in one series of said perforations and having a central opening in which is adjustably secured said handle or lever, and rectangular lugs upon the ends of said shaft.

2. A wrench comprising a handle or lever carrying a fixed jaw and screw-threaded for a portion of its length, a pivoted jaw having at its upper end a series of sliding perforations, a supporting-shaft having an enlarged central portion with a screw-threaded opening and a shoulder, and a spring secured to said shoulder having its free end resting upon the back of the pivoted jaw.

3. A wrench comprising a handle or lever screw-threaded for a portion of its length and having one of its ends curved and serrated to provide a fixed jaw, a pivoted jaw composed of parallel side bars having their lower ends curved and serrated, and their upper ends having a series of perforations and communicating rectangular openings, a supporting-shaft adapted to fit in one series of said perforations and having an enlarged central portion having a screw-threaded opening to receive said handle or lever, and a screw-wound screw-threaded shoulder, a spring having one end provided with a perforation and the opposite end enlarged, forming arms having their ends bent, and means for securing said spring to the supporting-shaft.

702,254. BOLT-LOCK. HARRY A. STECKMAN, Johannesburg, South African Republic. Filed July 16, 1901. Serial No. 69,496. (No model.)

Claim.—1. The bolt-holder herein described consisting of a tubular body having end rings and longitudinal slots on diametrically opposite faces extending between the end rings and provided at their ends with enlarged portions producing narrow necks at the ends of the bars formed by said slots and between the same and the end rings and having each bar threaded internally and the end rings unthreaded, the bars being provided with the longitudinal outwardly-projecting ribs all substantially as and for the purposes set forth.

2. A bolt-holder having the end rings, the longitudinal slots between the same forming the separated bars and enlarged at their ends producing the narrow necks at the ends of said bars, the said bars being threaded internally substantially as set forth.

3. A bolt-holder having the continuous end rings and provided between the same with the separated internally-threaded compressible bars substantially as set forth.

4. A bolt-holder comprising the end rings, and the separated bars connecting the said rings and provided at their juncture with the rings with reduced necks, the bars being threaded internally and the necks and rings being unthreaded substantially as set forth.

5. The bolt-holder herein described consisting of the tubular body having the end rings, and the longitudinal slots forming the bars and enlarged at their ends producing the narrow necks connecting said rings and bars, the bars being threaded internally substantially as set forth.

702,255. BOLT-LOCK. HARRY A. STECKMAN, Johannesburg, South African Republic. Filed Nov. 5, 1901. Serial No. 81,189. (No model.)

Claim.—In a bolt-lock, a holder for the bolt comprising an end ring, arms projecting from said ring and separated throughout their lengths at both edges, and having their extremities opposite the said ring free, and arranged to be expanded and contracted, said arms being provided internally with threads and having their outer sides tapered from their extremities toward the ring, and provided between said tapered portion and the ring with the longitudinal ribs, and with the shoulders facing toward the ring, the holder being adapted to be compressed by the tapered ends of the arms as the holder is inserted in a beam, and to be expanded within said beam by the introduction of the bolt, substantially as and for the purposes set forth.

702,256. WATERPROOF HAT. HENRY A. STECKMAN and ALBERT STECKMAN, Paris, France. Filed Dec. 2, 1901. Serial No. 94,412. (No model.)

Claim.—A waterproof coat comprising a body portion of water-

proof, non-elastio material, closed on all sides and having an opening at the top sufficiently large to pass over the head, and an elastic waterproof upper portion for enclosing the neck secured at its lower edge of the coat around its opening, said upper portion, in its normal or unstretched condition, being slightly smaller than the edge of the coat to which it is attached, and the parts of the body and neck which it encloses when in use, substantially as described.

702,257. SLIDING SPRING. HENRY G. SWAN, Cobham, Wm. Filed Mar. 7, 1902. Serial No. 97,111. (No model.)

Claim.—1. An elliptic spring having an upper and a lower leaf, one of said leaves having a straight curved end portion, the other leaf having a hook and engaging said straight end portion of the first leaf and a cap free from through-bolts and including said ends, said cap being secured only to the leaf having the plain end; substantially as described.

2. An elliptic spring having an upper and a lower leaf, one of said leaves having a plain rounded end, the other leaf having a hook portion engaging said rounded end, and a cap having closed ends and including the ends of the leaves, said cap being unconnected with the leaf having the hooked end and having a projection secured to the leaf with the rounded end; substantially as described.

702,258. RUBBER PUMPER. CLARENCE W. TAYLOR, New York, N.Y. Filed Apr. 7, 1902. Serial No. 101,736. (No model.)

Claim.—1. In combination, a burner-tube having a portion of its length corrugated to form a series of air-passages, and means mounted upon the burner-tube for regulating the supply of air to said passages.

2. In combination, a burner-tube having a portion of its length corrugated to form a series of air-passages, a regulating-plate mounted in said burner-tube, and means mounted upon the burner-tube for regulating the supply of air to the said passages and adapted to engage the said plate for operating it.

3. In combination, a burner-tube having a portion of its length corrugated to form a series of air-passages, a perforated sleeve mounted upon the burner-tube and adapted to have its perforations register with

the said passages, and a hood integral with the sleeve for rotating it to regulate the supply of air through the perforations of the sleeve to the passages.

4. In combination, a burner-tube having a portion of its length corrugated to form air passages or channels, a perforated rotatable sleeve mounted upon the burner-tube and adapted to have the perforations thereof register with the said air passages or channels for regulating the supply of air therein, a gas-regulating plate arranged in the burner-tube, and means connected with the sleeve for rotating it and engaging with the plate for simultaneously operating it with the said sleeve.

5. In combination, a burner-tube provided with air-intake and corrugations to form air passages or channels, and means mounted thereon for regulating the supply of air to the said channels or passages.

6. In combination, a burner-tube provided with air-intake and corrugations to form air channels or passages, a regulating-plate for the supply of gas arranged in the said tube, and means mounted upon the tube for regulating the supply of air to the channels or passages and for simultaneously with such regulation, operating the said plate.

7. In combination, a burner-tube provided with air-intake and corrugations forming air passages or channels, a rotatable sleeve having diagonally-extending slots registering with the said passages or channels for supplying air therein, and means for rotating the said sleeve for regulating the passage of air through said slots to said channels.

702,259. FIRE-SCAPE. GEORGE TAYLOR, Thorncliffe, Canada. Filed July 12, 1901. Serial No. 69,599. (No model.)

Claim.—1. The combination with a fire-scape embodying a rotatable reel or winch and a cable wound thereon; of brake mechanism for retarding the motion of the reel or winch, said mechanism comprising cooperating clutch members one of which is stationary and the other loosely mounted upon the winch-shaft, governor-arms rotatable with the shaft and pivotally connected therewith and adapted to force the clutch members into engagement with each other, a spring for relieving the governor-arms, and means for causing the governor-arms to move equally toward or away from the winch-shaft.

2. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a lowering-cable wound thereon; in combination with brake mechanism comprising male and female clutch members, one of which is fixed and the other loosely mounted upon the winch-shaft, oppositely-located grooved governor-arms pivotally connected to the shaft and having a sliding engagement with one of the clutch members, and a contractile spring controlling the governor-arms for normally relieving the pressure between the governor-arms and the adjacent clutch member.

3. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a lowering-cable wound thereon; in combination with brake mechanism comprising male and female clutch members, one of which is

stationary and the other movable on the winch-shaft, flanges on one of the clutch members, governor-arms pivotally carried by the winch-shaft and having their corresponding ends operatively associated with the flanged clutch member, a groove in the outer end of each of the governor-arms, and a contractile spring fitted in the said groove and controlling the governor-arms and operating to normally relieve pressure between the governor-arms and the adjacent clutch member.

4. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a cable wound thereon; in combination with brake mechanism comprising a pair of clutch members one of which is stationary and the other movable on the winch-shaft, governor-arms pivotally connected with the shaft and adapted to force one of the clutch members into engagement with the other clutch member, means for normally relieving pressure between the governor-arms and clutch member, pins projecting laterally from the governor-arms against which they bear, and means for equalizing the movement of the governor-arms consisting of a regulating-lever fulcrumed intermediate in ends and having oppositely-extending and reversely-curved arms cooperating with the projections on the governor-arms.

5. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a cable wound thereon; in combination with brake mechanism comprising male and female clutch members, governor-arms pivotally connected with the winch-shaft and operating against one of the clutch members, pins projecting laterally from the governor-arms, means for normally relieving the pressure between the governor-arms and clutch member, and regulating-levers arranged on opposite sides of the winch-shaft and governor-arms and comprising oppositely-projecting and reversely-curved arms which cooperate with the pins on the governor-arms.

6. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a lowering-cable wound thereon; in combination with brake mechanism comprising male and female clutch members, one of which is stationary and the other loosely mounted on the winch-shaft, guide-flanges on the outer surface of the male member, projecting arms connected to and rotatable with the winch-shaft, governor-arms pivotally connected to the projecting arms and having their inner ends operatively associated with the flanged clutch member whereby when their outer ends are thrown outward their inner ends will force the flanged clutch into frictional contact with the female member.

7. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a lowering-cable wound thereon; in combination with brake mechanism comprising male and female clutch members, one of which is stationary and the other movable on the winch-shaft, a pair of governor-arms pivotally carried by the winch-shaft and having their inner ends operatively associated with one of the clutch members and having their outer ends formed of semi-circular weights having openings in their meeting edges to embrace the said clutch, and a contractile spring controlling the outer ends of the governor-arms and operating to normally relieve pressure between the governor-arms and the adjacent clutch member.

8. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a lowering-cable wound thereon; in combination with brake mechanism comprising male and female clutch members, one of which is stationary and the other movable on the winch-shaft, flanges on the movable clutch member, a pair of governor-arms pivotally carried by the winch-shaft and having their inner ends operatively associated with the flanged clutch member, semi-circular weights secured on the outer ends of the governor-arms and having their meeting edges provided with half-cylindrical openings to embrace the reel-shaft and having their curved edge provided with an annular groove, and a contractile spring in the annular groove of the said weights operating to normally relieve pressure between the governor-arms and the adjacent clutch member.

9. A fire-scape embodying a rotatable reel or winch, a winch-shaft and a cable wound thereon; in combination with brake mechanism comprising male and female clutch members, an expansible relief-spring interposed between said clutch members, governor-arms pivotally connected with the winch-shaft and operating against one of the clutch members, pins projecting laterally from the governor-arms, means for normally relieving the pressure between the governor-arms and clutch member, and regulating-levers arranged on opposite sides of the winch-shaft and governor-arms which cooperate with the pins on the governor-arms.

702,260. PHOTOGRAPHIC CAMERA. JOHN E. THOMPSON, Manchester, England. Filed Jan. 2, 1902. Serial No. 712. (No model.)

Claim.—In a folding camera the combination with the body D, the lens-board pivoted thereto, the bellows E pivoted to the lens-board, the front B pivoted thereto, and the bellows connecting the front and body, of the stretching G of two parts pivoted together, the springs H under the stretching, the links I connecting the front to the stretching, the second links J for holding the front vertical, and the spring F connected to the

Arch B to cause the fork and with it the front into a vertical position when the base-board is released, substantially as described.

702,261. PHOTOGRAPHIC CAMERA. John R. Thompson, Manchester, England. Filed Jan. 4, 1902. Serial No. 712. (No model.)

Claim.—1. In a camera the combination with the base A, the front B, bellows C and casing D connected together, of the sliding expandable back G connected thereto, the second inner frame E, the lens F by which it is suspended, and the lens F' to permit of its opening wider at the aperture to receive the holder, substantially as described.

2. In a photographic camera, a body consisting of a rigid frame E, a foundation-frame F within the frame E, said foundation-frame F suitably connected to the frame E, and a back G adapted to slide within the said frame, in combination with a base A connected to the body and a bellows and front B suitably connected to the base and to the body.

3. In a photographic camera, a body consisting of a frame, a foundation-frame F suitably attached to the said frame, a back G sliding within the said frame, and an inner frame E for the said back, in combination with means connected to the foundation-frame and engaging with the back adapted to permit of one side of the back opening in advance of the other, and a bellows suitably connected to and supported by the body portion.

4. In a photographic camera, a frame E, a foundation-frame F suitably attached thereto, a back G sliding within the said frame, means connected to the frame F and engaging the back G for permitting one side of the back opening in advance of the other side, in combination with a bellows suitably connected with and supported by the said frame,

702,262. MACHINE FOR INSERTING AND FASTENING STRINGS IN LABELS. Stephen S. Galt, John S. Ransom, and Martin O. Ransom, Philadelphia, Pa., assignors to John Wessinger, Philadelphia, Pa. Filed May 21, 1901. Serial No. 68,077. (No model.)

Claim.—1. In a label-stringing machine the combination of mechanism for inserting a string through a hole in a label, means for cutting off a length of said string from a source of supply of the same, means for cutting off a piece of metallic ribbon, means for bringing the two ends of the string adjacent to a portion of the body thereof, and means for clamping the cut-off piece of said ribbon around the body and said adjacent ends of the length of string, substantially as described.

2. The combination in a label-stringing machine of mechanism for inserting a string through the hole in a label, means for cutting off a length of said string from a source of supply of the same, means for cutting off a piece of metallic ribbon and means for clamping the cut-off piece of said ribbon around the two ends of said length of string and a piece of said ribbon around the two ends of said length of string and a portion of the body thereof with means for bringing the said ends and a portion of the body into the same plane before the ribbon is clamped in position, substantially as described.

3. The combination in a machine for stringing labels, of mechanism for inserting a string through a hole in the label, means for forming the length of said string into two loops, means for cutting off said length of string from the source of supply of the same, and means for clamping a piece of material around the body and the two ends of the said string, whereby the two loops are held together, the label being string in one of the same, substantially as described.

4. The combination in a label-stringing machine, of mechanism for holding one end of the string, means for inserting a loop of the same through a hole in the label, means for cutting off this loop from the body of the string, means for laying the two ends and the body of the piece cut off in substantially the same plane, and means for clamping a piece of material around the three strands of the string and thereby forming two loops, substantially as described.

5. The combination in a machine for stringing labels, of mechanism for inserting a string through the hole in the label, means for holding one end of the string, means for cutting off a length of the same from a source of supply, means for holding the end of the piece cut off to the body part of the same, means for cutting off a piece of material, means for laying the two ends and the body of the piece cut off in substantially the same plane, and means for clamping the cut-off piece of material around the said three strands of the string substantially as described.

6. The combination in a machine of the character described, of a needle for inserting a string through a hole in a label, means for holding the said label, means for forming a loop in the string after it has been put through the label, means for cutting the string from the main supply of the same, mechanism for clamping a piece of material around the ends of the string, with means for tightly holding the string both in front of and behind the said clamping mechanism while it is in action, substantially as described.

7. The combination in a machine of the character described, of mechanism for cutting off and holding a piece of string, mechanism for

intermittently feeding a piece of material to be clamped around the end of said string, means for corrugating said material, means for cutting a piece of it off from the main body of the same and means for clamping it around said end of the piece of string, substantially as described.

8. The combination in a label-stringing machine of the character described, of mechanism for inserting a string in a label, means for cutting off a length of said string, means for cutting off a piece of material to be used for fastening the ends of said string together with means for bringing the ends and a part of the body portion of the string adjacent to each other and under the piece of cut-off material, and means for fastening said piece of material around the said ends and the body, substantially as described.

9. The combination in a label-stringing machine, of a table, a reciprocating plunger, a stringing-needle carried thereby, mechanism actuated by said plunger for holding and retaining one end of the string, an arm for forming a loop in the string after it has been passed through a hole in the label, with means for cutting off the string from its source of supply, means for bringing the ends and a portion of the body of said string adjacent to each other, and means for clamping a piece of material around the said two ends and the body of the string, whereby two loops are formed, the label being in one of the same, substantially as described.

10. In a machine of the character described, a reciprocating plunger carrying a needle having a passage within and on one side of it, and a second passage through it from front to rear, in combination with mechanism for forming a length of string into a loop as it passes from one of the passages to the other, together with means for cutting off the said length of string from the main supply thereof, means for bringing the ends of the cut-off length adjacent to each other, and means for fastening the said ends thereof together, substantially as described.

11. The combination of a reciprocating plunger, a needle carried thereby, having one passage through its side and a second passage through it from front to rear, with a groove connecting the passages, a notch in the side of the needle, a pivoted arm having one end connected to pass through said notch and to engage the string extending from one of said passages to the other, together with means for cutting off lengths of string, and means for fastening together the ends thereof after the said string has been inserted through the loop in the label, substantially as described.

12. In a label-stringing machine, the combination of mechanism for inserting a string through a hole in a label, means for cutting off a definite length of said string, with means for feeding a strip of material, means for periodically cutting off pieces of the same, a pair of jaws constructed to grasp one of said pieces and means for operating the same whereby they may be made to curl said piece of material around the ends and a portion of the body of the piece of string inserted through the label together with means for bringing the said three strands of the string into substantially the same plane previous to the operation of the jaws, substantially as described.

13. In a label-stringing machine, the combination of mechanism for inserting a string through a hole in a label, means for cutting off a definite length of said string, means for feeding a strip of material, means for curling the edges of the same, a knife for cutting off the strip, jaws having a curved recess in them constructed to grasp said cut-off piece of strip, and means for causing said jaws to place the piece of strip material over the ends and the body of the piece of string which had been inserted in the label, together with means for bringing the said three strands of the string into substantially the same plane previous to the operation of the jaws, substantially as described.

14. The combination in a machine having means for inserting a string in a label and for cutting off said string from its source of supply, a reciprocating shell or carriage for feeding forward a strip of material, a knife for cutting said material into pieces, an anvil on which said pieces are deposited when cut off, a pair of jaws having in them a recess, means for moving the anvil into a position in which the jaws may grasp the piece of material and means for operating the jaws whereby the said piece of material is clamped around the ends of the string substantially as described.

15. The combination in a machine of the character described, of means for inserting a string through a hole in a label, means for cutting off said string from its source of supply, jaws for clamping a piece of material around the body of the cut-off piece of string and the two ends thereof, means for holding together the three strands of the string, said means including an arm against which said jaws act when in operation and means for rigidly supporting said arm during the operation of the jaws, substantially as described.

16. In a label-stringing machine, the combination with means for inserting a string through the hole in a label and means for cutting off a length of said string from the source of supply, of means for bringing both ends and the body of said piece of string into the same plane and mechanism for fastening said ends and said body together, thereby forming two loops, the label being on one of the same, substantially as described.

17. In a machine of the character described, the combination of a table for holding a label, a needle-plunger, a slide movable in guides and in which said plunger is constructed to move, jaws pivoted together and yieldingly connected to said slide, with means for operating the needle-plunger whereby it is made to insert a piece of string in the hole in a label, means for cutting off said string from its source of supply, means for feeding and cutting off a strip of material for fastening the ends of the string, and means for operating the jaws whereby they act to curl the said piece of material around the ends of the string, substantially as described.

702,268. AUTOMATIC TELEGRAPHIC TRANSMITTER. John A. Tuckey, Goshen, Ind. Filed Feb. 14, 1902. Serial No. 94,816. (No model.)

Claim.—In an automatic telegraphic transmitter, a keyboard having a base of non-conducting material, a metal plate supported thereon, a stencil-plate of non-conducting material in which a telegraphic code is accurately cut out, said stencil-plate covering the metal plate and a fine-wire connected directly with said plate, said wire traversing the base of the keyboard, a stylus comprising a hollow shell of insulating material, a metal pin inserted in one end of said shell and a plurality of metallic wires projecting in the form of a brush from said pin beyond said shell, said brush fitting accurately the opening in said stencil-plate, and a second fine-wire traversing the shell and connected to said pin, said second fine-wire flexibly connecting the stylus to the base of said keyboard, substantially as and for the purposes described.

702,264. VACUUM APPARATUS FOR BOILING BRINE. Gustav E. Vm. Schweizerhals, Switzerland. Filed July 12, 1900. Serial No. 22,004. (No model.)

Claim.—It apparatus for boiling brine the combination with a brine vessel open to the atmosphere, a pan provided at its lower end with a tubular extension located in said vessel, a system of heating-pipes located in said pan, means for creating a vacuum in said pan, a pipe descending from the top part of the pan, and a liquid seal for the lower open end of said pipe, of a pipe connecting the pan at a point above the heating-pipes

with the brine-supply reservoir, a heat-exchanging apparatus the heat-receiving member of which is constituted by a portion of said pipe, and a pipe for supplying the heat-transmitting member of said apparatus with the condensed water formed in the heating system of the pan, substantially as and for the purpose stated.

702,265. MINING-CAR-DOOR FASTENING. JAMES E. WATT, Birmingham, Ohio. Filed Feb. 20, 1902. Serial No. 94,974. (No model.)

Claim.—1. In a mine-car-door fastening and unfastening device, the combination of a latch-operating lever pivoted to the door, and a bar connected to said latch-lever and adapted to project beyond the side of the car; with a cam fixed beside the track and adapted to engage said bar and cause it to move the latch-lever and release the catches, and an overbalancing-weight on the latch-operating lever adapted to move the lever still further so as to retract the bar and said bar within the recess or area of the car-door, substantially as described.

2. The combination of a mine-car, its swinging door, the latch-lever pivoted thereto, the bar connected to said lever, and a latch-bar connected to the said latch-lever, and adapted to project beyond the side of the car; with a cam-plate fixed beside the track adapted to engage said bar and cause it to move the latch-lever and release the bolts, and an overbalancing-weight on said latch-lever adapted to move it still further after the bolts are released so as to retract the bar and said bar within the area or edge of the car-door so that they will not interfere with the free swinging movement of the door, substantially as described.

3. The herein-described mine-car-door fastening, comprising a latch-lever pivoted to the door, opposite bolts pivoted to the latch-lever above and below its pivot, and adapted to engage keepers on the sides of the car, and a locking and tripping bar pivoted to the upper end of the latch-lever and adapted in one position to lock the latch-lever, and in another position to project beyond the side of the car; with a cam-plate fixed beside the track adapted to engage the projecting end of said bar and force the same inward causing it to rock the latch-lever and release the bolts from the keepers, and a weight on the upper end of the latch-lever adapted to move it further upon the release of the bolts so as to retract the latter and the bar within the edge or area of the door, for the purpose and substantially as described.

702,266. VALVE. HOWARD WHEA, Reading, Mass. Filed Dec. 1, 1900. Serial No. 733,723. (No model.)

Claim.—1. A device of the character specified, comprising inlet and outlet chambers, a partition separating said chambers and having a valve-seat, a valve controlled to close against said seat upon the attainment of a predetermined pressure in the outlet-chamber, a waste or vent outlet leading from the outlet-chamber, and a manually-operated spindle mounted for movement independently of the valve and adapted to close the valve against its seat when moved in one direction and having provision for closing said waste-outlet when moved in an opposite direction.
